A chimney involving some features of construction which are rather novel, at least in this country, says Carpentry and Building, is the one which has been erected in connection with the new power plant of the Joseph Dixon Crucible Company, at Jersey City, N. J. The chimney is built of radially moulded bricks perforated in such a way as to insure regularity of draft by preventing radiation through the walls and thus diminishing the susceptibility to atmospheric changes. The bricks are moulded in sizes and shapes of sufficient number for the construction of a chimney of any diameter, and of conforming decreasing radius to the progress of the structural elevation. The perforations are intended not only to form dead air spaces, but also to give a better hold to the mortar, and, it is said, to increase the joint adhesion.

HANDLING SHINGLE SAWS.

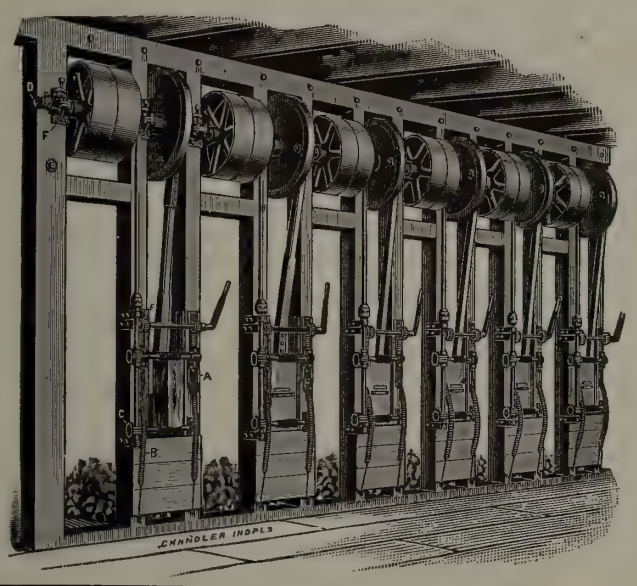
J. W. Ball, in the Wood-Worker, says: A knowledge of straining or tensioning shingle saws is becoming more necessary for a filer every day. Fifteen years ago the feeding of shingle saws was principally done by men of middle age. Why? Because they had more patience and experience than the young man of that time. There are men that can hammer shingle saws so that a man of little experience can do good work on them. I have hammered 18-gauge shingle saws for men to run that had not two months' experience, and they made a success of it just because the saws were properly hammered for the motion. I will not attempt to explain saw-making, but will say a few things that may help the filer.

I have known of ashingle saw being hammered without removing it from the flange. Never do this as no man can tell much about it this way. Always take the saw from the flange. Use the straightedge from center to rim, then use it crosswise of a line running from center to rim. Do this over every inch of the saw. If you use a long straightedge on a saw that has lost all its tension, you may find it to stand in a twist. Do not try to bend this twist out as, the rim being so loose, will cause it to stand in this twist; simply stretch the saw from center to very close to the rim. When you have done this on both sides of the plate and filed the body of the saw, you will not be able to find that twist; but do not fill the center too full.

When using the straightedge on the bevelled side of the saw you may rim it from center to the outer edge of flange seat, then from there crosswise of a line running from center to rim. Use a 12-inch straightedge for this, then to finish use as short as 6-inch. Be sure that your shingle saw shows tension clear out to the rim, leaving the extreme cutting edge the tightest; with a gradual or even tension toward the center. For saws 40 inches in diameter, 16-gauge rims, to run 1,600 per minute, the center should sag from a straightedge that reaches clear across the plate, about 7 gauges; that is, the thickness of a 7-gauge piece of steel. If the saw is of good temper and steel it will be about the proper thing, but if the extreme cutting edge is not the tightest it will not do its work if the center should sag one inch, but would flutter on the rim when under motion.

You cannot tell much about your saw when screwed down to the flange; that is, about the tension. Always take it off the flange to test the tension or strain. Some people hammer more on the block side of the saw so as to hold it into the block a trifle, but for vertical machines I prefer it tensioned perfectly even, both sides alike; for horizontal machines they work well strained a little more on one side—just enough to counteract the weight of the rim, as it has a tendency to lop down a trifle when under motion. Do not use a cross-face hammer to take tension out of a shingle saw; use the round-face or dog-head, with not very round or sharp face, so it will not cut the plate. Use a steel-faced anvil and have it a little oval or a little high in the center. Do not use a flat anvil for shingle saws; it will not give the desired results. I like a 6x9-inch, or a round-faced anvil say 7 inches in diameter, of about 80 pounds weight. I use the 4¼ pound hammer to strain or tension with and 2½-pound hammer to even and finish with, but this is to everyone's option. Use what you can handle best is my advice.

The Best Excelsior Machine in the World



When two or more knives are run with one belt, all must stop when the belt is stopped to set bits or from any other cause. Our Machine has a belt for each knife, hence but one knife stops at a time. This great advantage should not be overlooked by purchasers. Time is money. Our Machine cuts more excelsior in a given time than any other machine. Get our circulars and rices.

WOOD PULP DEPARTMENT

JAPAN IMPORTS OF PULP.

The following table shows quantities and values of wood pulp imported into Japan for the years ended December 31, 1897, 1898 and 1899:

Countries.	1897. Quantity. Kin.	1898. Quantity. Kin.	1899. Quantity. Kin.
British America	.....	378,917	2,874,453
Denmark	.....	26,880	.....
Germany	871,053	2,592,160	2,092,211
Great Britain	.....	246,901	1,068,503
Sweden and Norway	553,046	2,124,007	380,422
United States	1,369	1,579,732	172,608
Other countries	8,400	.....	.....
Totals	1,433,868	6,948,597	6,588,197

NOTE.—Kin=1·3251 lbs.

BRITISH IMPORTS OF PULP.

THE Board of Trade returns have just been issued showing the imports of wood pulp by the United Kingdom for the year 1899. The figures show an increase in the importations of chemical pulp and a decrease in mechanical pulp last year as compared with the previous year. Of chemical pulp the importations in 1898 were 179,525 tons and in 1899 196,926 tons. Of this 10,116 tons were imported from Canada in 1898 and 5,754 tons in 1899. The total importation of mechanical pulp was 225,317 tons in 1898, and 218,187 tons in 1899. Of these quantities 36,569 tons were received from Canada in 1898, and 36,288 tons in 1899. The bulk of the importation was from Norway, which is represented by 141,455 tons and 162,894 tons in the two years, respectively.

AMERICAN SULPHITE MANUFACTURERS' ASSOCIATION.

Since our last issue a meeting of the above association was held at Boston, at which The E. B. Eddy Company, of Hull, The Cushing Sulphite Fibre Company, of St. John, N.B., and The Maritime Sulphite Fibre Company, of Chatham, N. B., were admitted to membership in the association. This leaves but one Canadian company, namely, The Laurentide Pulp Company, of Grand Mere, Que., not represented. An intimation was received from one of the influential directors of this company stating that he would recommend to the Board that membership in the association be applied for. The Sault Ste. Marie Pulp & Paper Company, of Sault Ste. Marie, Ont., will commence the manufacture of sulphite pulp at an early date, with a daily capacity of forty tons, and is also expected to join the association. An inventory of stock on hand showed that the mills composing the association were well sold out. The association now represents a production of 800 tons of sulphite pulp per day. It was unamiously decided to maintain the price of No. 2 sulphite at the minimum of 2.10 cents.

NEW PULP MILL AT THOROLD.

The new pulp mill which has just been commenced by the Thorold Pulp Company will be located on the old Welland canal, just above Lock 22. The power will be furnished by the canal, having a head of 14 feet at this lock. There will be five horizontal New American water wheels, four of which will drive directly on to the grinder line. The capacity of the plant will be about 10 tons. There will be two Dilts grinders, two wet machines, four screens and wood preparing machinery. The company will use spruce wood exclusively and will be prepared to make a very fine grade of pulp.

The grinders will be located in the basement, whence the stock will be pumped to a stock tank in the second story, from which the stock will flow by gravity to screens and wet machines, necessitating only a stock pump for the entire plant. The water supply will also be from the canal, and the filter box will be supplied by gravity. The entire wheel pit and bulkhead will be of stone, laid up in Portland cement mortar, and the flume will be of heavy timber, lined with 3 inch plank. The first story of the building will be of coursing stone, laid up in cement. The second story will be timber frame and sheathed with iron. The entire first floor will be of cement.

Falls, N. Y. The ground has been broken and the stonework begun. Unless delayed by the non-arrival of machinery the mill will be in operation by Christmas. The mill was designed by Charles H. Vogel, of Thorold.

The incorporators of the company are Thomas H. Paterson and W. M. Davidge, of Niagara Falls, N.Y., and J. Brown, Elmer E. Rowe and Ed. Morris, of Warsaw, N. Y. The capital stock is $30,000, all paid up.

OUR EXPORTS OF PULP.

FROM the unrevised returns lately issued of the trade for the fiscal year ending with June last, it is impossible to get an idea of what the total sales of Canadian pulp and paper amounted to in that year, nor any idea of what the paper imports from the several countries totalled. Of books, pamphlets, etc., there were imported in that fiscal year $1,191,614 worth, as against $1,119,805 in the year 1898-9. The value of the paper and envelopes imported amounted to $1,401,698, as against $1,247,885 in 1898-9. The exports of pulp to Great Britain show a marked increase. They rose to $687,256, as against $310,385 in 1898-9 ; that is, they more than doubled in value. In quantity the exports of Canadian pulp to Britain were almost two and a half times as great last year as in the previous year, being 40,801 tons, as against 16,445 tons in 1898-9.

But the exports to Britain were far from being the only ones. Those to the United States, says the Paper Mill, must have been quite large, though the increased returns do not particularize them. Last fiscal year there was more sulphite fibre shipped across the line than ever before. Also, considerable quantities of ground pulp were sent thither.

It would be interesting to know the value of the exports in pulp wood, but of these the reports, in their present state, say nothing. It is probable they are not materially more or less than the average of the previous three years. Though the Ontario law prohibits exports from the Crown Lands, the statute did not cover last year. Expecting it this year, the American importers would doubtless get out all they could. But against their extra efforts are to be placed the facts that the streams were not full all the rafting season ; that the timber has to be sought farther in the interior ; that prices were higher, and that the Quebec law was in force from the date of enactment. Thus exports of pulp wood to the United States might be less than they were in 1898-9, but they would scarcely be more.

A report just issued by the Department of Trade and Commerce at Ottawa gives the returns of trade with many foreign countries for the last three years. Japan's trade is interesting from the fact that last year Canada's chief article of exportation to that country was wood pulp, Canada contributing more than one-third of Japan's total imports of it.

PULP NOTES.

A movement is on foot to erect a pulp mill at Ladysmith, B.C. The timber of Vancouver Island is said to be well adapted for the manufacture of paper and fibre ware.

At Brompton Falls, Que., the by-law granting a bonus of $10,000 to the American Paper Company to erect a pulp and paper mill at that place was carried last month without opposition.

The Consolidated Pulp & Paper Company, of Toronto, expect at an early date to be in a position to commence work on the enlargement of the Thomson pulp and paper mills at Newburg, Ont.

A by-law to grant a bonus to the Patterson Pulp Company was defeated by the ratepayers of Thorold, Ont., a few weeks ago. It is said, however, that the building of the mill will be proceeded with immediately, from plans prepared by Mr. Chas. H. Vogel.

The Laurentide Pulp Company, of Grand Mere, Que. held their annual meeting in Montreal a fortnight ago, at which the Board of Directors was re-elected. Mr. Alger will continue as manager.

A number of Boston capitalists have formed the Nova Scotia & Boston Wood Pulp Company and purpose erecting a pulp mill at Wentworth, N. S. The resident manager will be Mr. C. E. Meserve.

C. B. Pride recently returned to Appleton, Wis., from a visit to the Rainy Lake district in north-western Ontario, where he made preliminary surveys of a water power which it is proposed to utilize for a large pulp mill.

Mr. W. R. Calder, of Bridgewater, N.S., recently went with a surveyor to Hamilton Inlet, on the Labrador coast, where he has in view the erection of saw and pulp mills. It is stated that he has an option on 300 miles of timber lands covered with an excellent quality of young spruce.

The following are the principal countries that supply the German market with chemical wood pulp, the percentage relating to supplies during the first half of 1900: Austro-Hungary, 59 per cent.; Finland, 16 per cent.; Sweden, 13 per cent.; United States, 2¾ per cent.; Norway, 1½ per cent.

There seems reason to expect that a pulp mill will be built at Dryden, Ont. It is stated that the concessions asked for by the company will be granted and that active operations will commence next spring. The venture is financed by English capitalists who propose expending half a million dollars in the preliminary work. Charles Campbell, a paper maker of New York state, and a Mr. Wright, of England, are interested.

Scandinavian manufacturers of pulp and British manufacturers of paper are in a controversy that is interesting, not to say amusing, and it is a question whether the point at issue would be classed as a theory or as a condition. The Scandinavians contend that the product of their mills is already sold ahead ; that prices are going to be high, and that anybody who does not immediately "get on board the train will be left." On the other hand, the Englishmen say that they are not only well provided with pulp, but that they are even turning an honest penny by selling some of their surplus, and that they can get all they want from Canada, and therefore are independent of the Scandinavians. The real point of interest in the affair is this, that the English paper manufacturer has now become so well accustomed to the use of Canadian pulp that he regards Canada as a natural source of supply, and that hereafter the battle between the Scandinavian and Canadian mills will be fought out solely on the issues of price and quality, regardless of traditions and customs that have prevailed heretofore. The tactical position of the Canadian pulp manufacturers has been improved vastly within the past two or three years.—Paper Mill.

SPECIAL NOTICE

We have inaugurated a **STOCK REDUCING SALE** for October, November and December, and will quote reduced prices on all inquiries received for shipment during time named.

We have a complete stock in all kinds, grades and dimensions, one to two years old, Bone Dry Hardwood Lumber, Yellow Pine and Cypress, kiln dried Maple Flooring, plain and quartered White and Red Oak Flooring, Surfaced Lumber, Wagon and Dimension Stock, and can ship straight or mixed car lots, quick delivery.

We have numerous stocks, last year's cut, piled in connection with saw mills in the country that we propose to close out and will quote you on a basis of lumber made, dried and delivered from the stump to your factory (no yarding expense). Besides we are offering special prices on Quarter Sawed Forked Leaf strictly White Oak, all one kind and color, well manufactured, band sawed, principally large figure, good widths and bone dry, including Quarter Sawed Red Oak, uniform color, quality and grade.

Inquiries solicited.

AXE AND SAW COMPETITIONS.

At the annual meeting of the Australasian Axemen's Association held at Spreut, Tasmania, Australia, on July 21, 1900, a feature of much interest was the international teams' matches, inaugurated for the purpose of giving British manufacturers an opportunity to prove that they could make tools of quality equal to those made by their successful rivals, the American manufacturers. The result is given in the Australasian Ironmonger, as follows: In the axes, the beautiful gold medal given by the association was won by W. Hunt & Sons (Brade's Ltd.), England, with "Plumb" axes, America second. Several other American and English makers showed up wonderfully well, and the final between England and America created intense excitement. This great win for the home land should largely help to bring English axes into favour again. The gold medal for saws was contested for by only the three great American firms, Disstons, Simonds and E. C. Atkins, and the Atkins saws scored a meritorious victory, the Simonds being second. The correctness of this decision has come out in a marked degree during the months since the sports, for the Atkins saws used in the contest, having been distributed among professional sawyers, have won splendid unsolicited testimonials for their cutting powers and all round quality. The gold medals for files and axe handles were both won by American firms.

RUSSIAN SAW MILL PRACTICE.

A correspondent of the American Lumberman says: There is very little in the handling of logs in a Russian saw mill to distinguish it from similar institutions in Europe, although it is usually vastly different from the modern American band mill, with its many labor-saving appliances—not all of which, it must be admitted, are material-saving as well. Probably the most universal implement for reducing logs to thin lumber is the saw frame or gang through which the entire log is fed without first reducing it to a cant. The resulting boards are often piled and seasoned with the outer bark upon them. They are usually edged, however, before being transported to any considerable distance. In some of the remote portions of Russia the old primitive pit saw is still in use, one man standing upon the log and his fellow-workman in the pit underneath it, the saw being manipulated in an approximately vertical direction. It is only on the far Russian frontier, however, that this method is in vogue. Special forms of portable saw mills are, however, often used, a small gang frame on wheels being the more common type. Of course, a temporary timber foundation is constructed for it wherever it is set up.

The circular saw is also used to some extent for the cutting of logs into timber, but usually finds its greatest application in the different varieties of cut-off saws, edging-saws, slab-saws, etc. For the cutting of the more expensive woods for cabinet-maker work the band saw is also coming into use, and one or two of the larger saw mills are already quite extensively equipped in this direction, some of them with machinery of American manufacture. Other devices, such as live rolls, etc., are also in use, and the various forms of planing machines correspond quite closely to ours, although for surfacing timbers they still retain the form in which the planing knives are set in the face of a circular disk which revolves horizontally upon the upper face of the timber. This form of planer is almost unknown in this country at the present time, although one was in use for surfacing timbers in Chicago as late as four or five years ago.

IT IS HELD IN HIGH ESTEEM.

Mr. Ed. Sykes, Lady Bank, Ont., in renewing his subscription for another year, writes: "I esteem the Canada Lumberman very highly, and should not like to be without it."

R. D. Walsh, of Chatham, N. B., has added to his factory equipment a large planer and matcher.

The Canadian Rubber Co., Toronto, are in receipt of a letter from the Conger Lumber Co., Toronto, in which they say: "Replying to your favor of the 21st ultimo, asking our opinion of the rubber belts furnished us, we write to say generally that they have uniformly given us excellent satisfaction. Respecting the large twenty-eight inch driving belt you recently made for us, we can truly say we don't see how a better belt could be made."

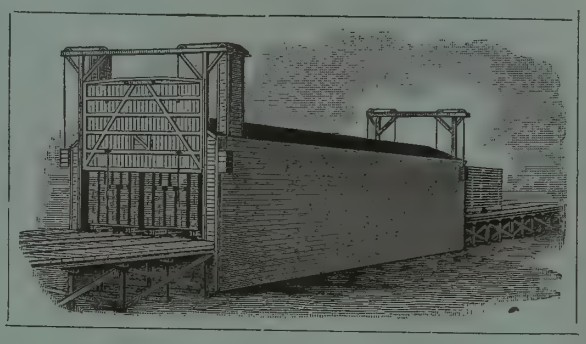
THE DRY KILN THAT DOES NOT Disappoint



THE DRY KILN THAT DOES NOT Disappoint

The Standard Seemed the Most Common Sense Dryer, and We Made No Mistake in Our Choice.

BRANTFORD, Ont., April 4, 1900.

THE STANDARD DRY KILN CO., Indianapolis, Ind.

GENTLEMEN:—Having had for the last twenty years considerable experience with Dry Kilns—Hot Blast and others—without getting the desired results, last spring there being no dry lumber to be had, especially in hardwoods, this compelled us to take up the question of more drying capacity. After very careful consideration The Standard seemed the most common sense dryer in the market, and we are more than pleased to say that we made no mistake in the choice. We have had the best of satisfaction from exhaust steam only, not requiring to use any live steam. If we were adding another kiln, we would certainly put in another of your make. It is a great saving on stock; it comes out in splendid shape. Yours truly,

THE SCHULTZ BROS. CO., Ltd.

THE STANDARD is the highest type of development of the **Moist Air** System of Drying. Hundreds of users in all parts of the world say THE STANDARD has absolutely **no equal.**

MAGNOLIA METAL

In Use by All the Leading Governments

BEST ANTI-FRICTION METAL FOR ALL MACHINERY BEARINGS.

BEWARE OF IMITATIONS

Genuine Magnolia Metal is made up in bars, of which this is a fac-simile :

The Name and Trade Mark appear on each box and bar, and besides this the words "Manufactured in United States," and "Patented June 3, 1890," are stamped on the under side of each bar.

This Saw Stands Without a Rival

AND IS THE

FASTEST CUTTING SAW IN THE WORLD!

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

Maple Leaf Saw Set

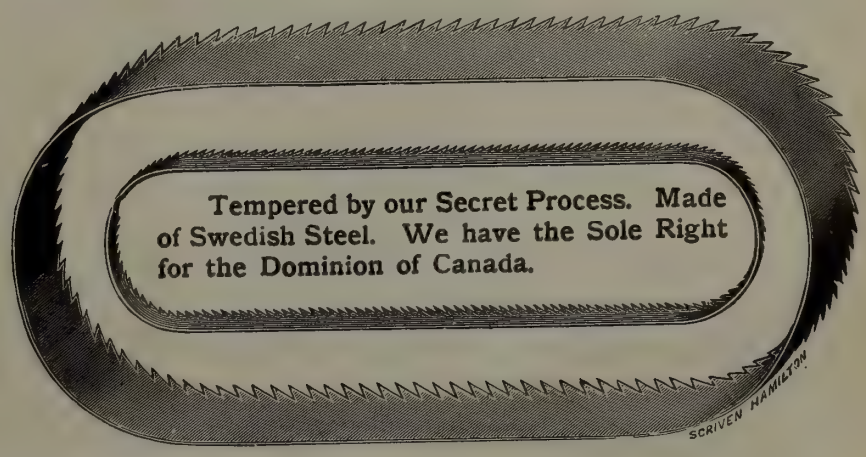
MANUFACTURED BY

SHURLY & DIETRICH, Galt, Ont.

Directions.—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake Be sure and not strike too hard a blow, and it will set the hardest saw. **On receipt of 40 cents we will send one by mail.**

We are the only manufacturers in the world who export Saws in large quantities to the United States.



We Manufacture

HIGH GRADE BAND SAWS

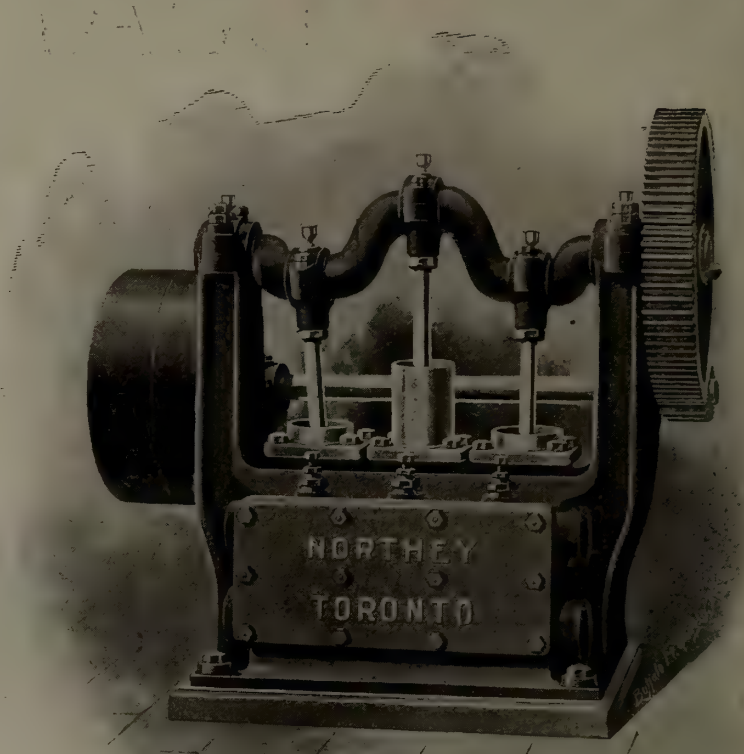
of All Widths and Lengths.

These Saws are made of Refined Swedish Steel imported direct, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

Northey Triplex Power Pump

FOR BOILER FEEDING AND GENERAL PRESSURE PURPOSES

In the Northey Triplex Power Pump we offer a machine put together with the skill brought by years of experience in pump building, and with full provision made for the varied demands likely to be made upon a pump of this character. A feature of value is that the three cranks are placed 120 degrees apart, thus giving a practically constant flow of water—minimizing strain on pump and economizing power. The pump can be readily repacked and taken up, and all details are carefully worked out. It can be conveniently operated by electricity, by water power, or by belt from engine. Different styles and sizes made to suit all duties.



WE ARE MANUFACTURERS OF OVER FIVE HUNDRED DIFFERENT STYLES AND VARIETIES OF STEAM AND POWER PUMPS FOR STATIONARY AND MARINE PURPOSES. WE INVITE ENQUIRIES FROM ENGINEERS, MINE SUPERINTENDENTS AND OTHERS FOR THEIR REQUIREMENTS IN OUR LINE. CATALOGUES AND SPECIFICATIONS FURNISHED UPON REQUEST.

We are also manufacturers of the Northey Gas and Gasoline Engine which has proved to be the handiest and most convenient power for small or intermittent power users in the market. Suitable for machine shops, pumping and electric light plants, etc. Write for illustrated descriptive booklet.

TRANSPORTATION OF LUMBER BY MEANS OF SLUICES.

ONE of the most interesting features in connection with the lumber business in the vicinity of Parrsboro, N.S., is the method by which lumber is transported from the mountains and hills to the coast. Sluices are constructed of plank—ordinary rough lumber—using two-inch plank for the bottom and one or one and one-half inch stuff in the sides. The sluices are usually about 12 inches wide and 7 inches deep, being cleated across every three feet. They have an incline which varies according to the lay of the land, the pitch being perhaps one inch to the rod at the lowest, and in other places ten inches to the rod and often steeper.

The sluice turns and twists about the hills, hugging mother earth wherever possible, or boldly defying her close embrace, leaps into space and over chasms and valleys with wonderful skill.

A few years ago the writer, while wheeling from Acadia Mines to Parrsboro, suddenly saw before him, down a long, broad, deep valley, what seemed like a gigantic spider web deftly swung from ridge to ridge, and strong enough apparently to waft away in the breezes. A cautious and nearer approach proved most interesting in results. The skeleton structure of round and rough logs and poles, ingeniously framed, bolted and spiked together, soared aloft to nearly 150 feet overhead, supported far up there among the breezes which gently conveyed it a strip of wooden trough which here and there sprinkled drops of water upon the wayfarer beneath. He gazed in wonder at the innocent cob-web apparently holding aloft a thread of water, which bore past on its surface thousands of feet of lumber each hour of the day, from its home in the recesses of those blue hills to the decks of vessels lying by the sea shore many miles away.

The illustration given with this article is of one of these fairy structures in the neighborhood of Humming Brook, on the Moose River, and at this point 135 feet in height. Last spring it was torn down and rebuilt, and in the summer 2,000,000 feet of lumber passed over it. It is so stayed and braced that it can resist great wind pressure, and is an example of the skill and ingenuity required in modern lumbering. The sand and sediment from the streams of water carried into these sluices soon fill up all cracks and make the troughs very water-tight. Sometimes, as in the case of the Canaan sluice, which is four miles long, no feeders are necessary, but usually small streams are led into the sluice at convenient points on the line, supplying any deficiency which may be made by leakage. At the head of the sluice the deals are simply placed in the stream of water flowing down the trough, and left to their own sweet will in finding their way to the foot of the mountains or to the sea shore, as the sluice may lead them to. Of course, the precaution has to be taken that no jams occur, and if the deals went singly this would very easily happen, owing to the varying grades and the different depths of water and speed.

On a suddenly increased incline the water flows very swifty and thins out greatly, so that a deal behind could easily mount upon one in front, causing a jam. To guard against this the deals are tacked together, butt to butt in piles of some dozen or more, usually with five-link chains. Two-inch nails are attached to the end links of the chains, and the work of tacking the deals together is slight. Occasionally lath and ordinary nails are used to make the connection. Arriving at the wharf, or destination, the lumber falls from the carrier on its proper pile, and in some cases has been thrust directly from the mouth of the sluice to the deck of the vessel, while the water falls shorter and goes down between the deck and the wharf. The chains are loosened easily by means of a claw pry two or three feet in length, and as they accumulate are loaded into a wagon and hauled up into the woods again.

A sluice used at River Hebert by Mr. Kelley, though quite a long one, has such a uniform grade that no tacking is necessary. When the sluice is tasked to its full capacity, boards may be loaded on top of the deals and sent down. These carriers are often very long, the longest near here being the one at Moose River, which is 6½ miles in length. The Canaan sluice is 4 miles, another at Lakeland is 3 miles, and the Elderkin sluice, down shore, is a shorter one. The Moose River sluice has been operated for 6 or 7 years, which is about their lease of life, renewing usually being necessary at expiration of that time. They are often over a hundred feet high, and again may tunnel beneath an intersecting lumber road or highway.

It is most interesting to watch the stream of water beneath one flitting swiftly past, bearing presently on its surface from around a neighboring curve a single deal which passes silently and in a moment tops a rise and flips from sight. Then a string of deals may follow, with joined hands as it were, by reason of their connecting links, and they, with equal celerity and silence, swirl past and downwards without a sound save the gentle swish of water and an occasional nudge to the side planks. Of course, the route must be watched, for a jam soon multiplies, and they are not entirely avoidable. Shelters are built here and there for the men along the sluice, and these are nothing if not picturesque, as they perch high upon the end of a long trestle, but once the sluice is built and in operation the mill is almost equal to being located at the wharf, the expenditure for transportation being limited to the care of the line and its watching, and amounting to perhaps 25 cents per thousand feet of lumber.

A. B. P.

TRESTLE SUPPORTING LUMBER SLUICE OVER HUMMING BROOK, N. S.

AN ELECTRIC PLANING MILL.

A writer in Barrel and Box expresses his pleasure in inspecting a planing mill plant which was electrically driven from stem to stern. Every planer along the line, he says, had a motor right on the planer counter shaft of such size as the individual machine required, and there was no shafting in sight whatever, except these little short counters which go along with, and are essentially parts of the machine. There were eleven motors in this place, each swing crosscut saw had its little individual motor, which was set on an overhead beam and belted directly to the counter shaft at the upper end of the swing frame, and over in one corner was the grinding machinery, which also had its little individual motor. All through the place it was impressive of the statement made in the first of the series of articles, that it seemed as if electricity would crowd the heavy belts and long strings of line shafting to the wall—lay them in the fence corners—for this plant had a general appearance of not having any machinery of this kind about it. The power for the plant was supplied from the engine room of the saw mill, which was some distance away, and it was doing its work silently and unobtrusively.

THE CANADA LUMBERMAN (weekly and monthly) One Dollar per year.

PROSPECTS FOR LOGGING OPERATIONS

Information from all parts of the Dominion.—Scarcity of Labor in Many Districts, and Wages Generally High.—Output of Logs Likely to be Less than Last Winter.

LOGGING operations for this winter being well under way, opinions were solicited from several lumbermen as to the conditions which have existed in the woods and the prospects for the season's work. By the kindness of those from whom enquiry was made, we are permitted to publish below letters from nearly every section of the Dominion :

ALEXANDRIA, ONT., Nov. 19th.—We would say the amount of timber expected to come out in the eastern section will be about the same amount as usual. The advance in prices of all kinds of goods, and of wages, will raise the cost of logs about 25 per cent. over that of former years, which, we hope, will be offset by an equal advance in the price of lumber.

MACPHERSON & SCHELL.

PETERBOROUGH, ONT., Nov. 14th.—We expect the saw logging industries in this locality to yield about the same output as in the past year. In our camps we expect to cut about 12,000,000 feet. The fine weather this fall has been well taken advantage of in clearing up creeks and dumping grounds and in creek repairs. Labor is offering freely, but at an increase in rates over last season. Supplies generally are plentiful and at about last year's prices, excepting bacon, which is considerably higher.

THE DICKSON CO.

ROCKLAND, ONT., Nov. 12th.—At present we cannot give you information that can be relied upon as to the intake of saw logs for the coming winter, so much depends on the nature of the winter we may have. Men's wages are excessively high, and the cost of logs will even be greater than the very high cost of last season. Fewer men are in the woods, and with the most favorable winter the crop will be somewhat short of last season. The full measure of the shortness will depend on the character of the winter.

W. C. EDWARDS & CO.

OTTAWA, ONT., Nov. 12th.—Logging operations are about in the same condition as one year ago. Labor is much more unsettled and wages much higher, being fully 20 to 25 per cent. above last year. The same may be said of provisions and supplies in the main, but not every article. Pork is worth fully 30 per cent. more, also sugar, beef, butter, in fact almost everything but flour, which remains about the same. Hay and oats have not advanced nearly so much as pork. I think the production for the winter will be fully as great as last winter and likely more.

ST. ANTHONY LUMBER CO.

OTTAWA, Nov. 10th.—Regarding logging operations, we do not think that they will be quite as extensive as last year, owing to the fact that men are so hard to obtain. We know of several operations which are being carried on with not much more than half the complement of men required, and this seems to be the general complaint in every section. Then again, the cost of labor and supplies is going to be the means of putting a number of the smaller operatiors out of business, as they are going to find it much harder to obtain both men and provisions, the former of which only can be had on a strictly cash basis, as the men are very independent now and will go where they can get the best wages and best attention. Assuming that we have good weather, we think that the output will be fairly large, but we do not know that it will exceed last year's cut, especially in this section, as another difficulty has arisen which will prevent two or three parties taking out as large a supply of logs as they did last year, and that is the fact that two or three of the mills have been burned. There is going to be considerable difficulty experienced in the cutting of the logs.

"OTTAWA VALLEY MANUFACTURER."

THREE RIVERS, QUE., Nov. 13th.—From what I can make out now I think the cut this winter in our district (weather favorable) will be, viz, logs, pine and spruce, fit for sawing into deals, planks and boards, about same; pulp wood logs, spruce, fully one-third more. The cost will be 12 to 15 per cent. greater than last winter.

ALEX. BAPTIST.

CHARLEMAGNE, QUE., Nov. 17.—We expect to get out our usual supply of logs this winter, 250 to 300 thousand pieces. No firms in this district have increased their operations. The weather has been very favorable for cutting and skidding, but men are scarce and all supplies dearer. The cost of getting out logs this coming season will be 25 or 30 per cent. more than last year.

CHARLEMAGNE & LAC OUAREAU LUMBER CO.

QUEBEC, Nov. 13th.—It is too early yet to say how far weather conditions will affect our output. The labor question is a very important factor, for wages have gone up very considerably and laborers are scarce. Another difficulty which has to be confronted is the scarcity of suitable horses. The cost of supplies will not materially affect the output where markets are good and labor available at reasonable prices. Our view of the situation is that labor being scarce and a large portion of this labor devoted to the production of wood to be converted into pulp, the cut of logs to be sawn into lumber will be considerably reduced, probably to the extent of 10 to 15 per cent. These remarks apply altogether to the crop of spruce logs in the Province of Quebec.

KING BROTHERS.

AMHERST, N. S., Nov. 20th.—Regarding the output of logs from this province for the coming winter, our opinion is that the quantity taken out for the regular stationary mills will be about the same as last year. The portable mills, however, will not likely get out over sixty or seventy per cent. of last year's cut.

RHODES, CURRY & CO.

YARMOUTH, N. S., Nov. 15th.—The cut of logs for sawing is affected by the kind of weather we have in January, February and March. If we have a fair amount of cold and snow, cold to freeze the swamps over and snow to faciliate hauling logs to the river margin, we will have average cut here.

PARKER, EAKINS & CO.

BEAR RIVER, N.S., Nov. 13th.—The outlook for the coming season is about as usual, and the result of the winter's work will depend entirely upon the supply of snow. Last winter was scarcely an average cut owing to the unfavourable winter, but with reasonable good weather there will be a moderate increase over last year's output. The quantity carried over from this year will be the smallest in the last 20 years, and the demand is good.

WOLFVILLE, N. S., Nov. 19th.—Regarding lumbering prospects for the coming season, would say, first, that supplies are about the same price as last year; beans, pork and fish are somewhat higher. Labor has advanced slightly. Our logging season usually being very short, we seldom have any snow hauling until the latter part of January, and even if the coming winter should be a favorable one, it is doubtful, on account of many small properties being worked out, if any more logs will be taken out this year than last.

S. P. BENJAMIN.

LOWER STEWIACKE, N. S., Nov. 15th.—Up to the present time here the weather has been exceptionally mild and also rainy—so much so that lumbering operations in the forest are very much retarded. Supplies are high and labor is higher. I regard the latter item as the worst feature in our business, since labor is both scarce and dear. The production of logs in this section is certain to be smaller than usual this winter, from several causes: First, the scarcity and dearness of labor; secondly, lumber is getting cut away and is not so plentiful as formerly; then again the foreign outlook is not so promising in respect to prices as at this date last year. On account of our snowless winter in Scotia, last winter, our lumbermen even with prices did not realize high profits, and now with a ch for lower rates, labor being scarce and logs scarce encouragement is not present for large operations knowing, of course, what kind of a winter there ma If as unfavorable as last, it will be better to desist operating, especially if any chance for smaller p In Nova Scotia, the larger operators have to keep business going, but are not in any case proposing more than an average cut, if even that much. The again, a smaller class of operators who run po mills, buying up small tracts of timber and manuf ing the same into deals. These people this winte not nearly so much in evidence. They can shut without much loss to themselves, and are doing so of instances. Hence, all indications point to a s production of lumber here, even under the most able circumstances. The foreign markets h available stock on hand, are not moving in the w contracting, thinking prices too high. Our peopl backward about going into the woods, fearing prices, and it will soon be too late to catch up for a cut, even should the European buyers take hold.

ALFRED DIC

ST. GEORGE, N.B., Nov. 12th.—We think the cut o ber on our river (Magaguadavie) will be smaller tha year.

JOHN DEWAR & S

ST. JOHN, N. B., Nov. 12th.—At present the pro for successful logging operations are poor, the w unfavorable, wages excessively high and men e ingly scarce, while supplies of all kinds are high. with favorable weather, logging operations are to be less than last year.

ANDRE CUSHING &

SHEILA, N. B., Nov. 16.—As far as we are a judge there will be about the same quantity of lo in this district as last season. Labor is scarce, s cost more than last year, and the weather has be favorable—too much rain all fall; these causes will logging more expensive than last season, and may a tendency to reduce the output.

TRACADIE LUMBER

CHATHAM, N. B., Nov. 19th.—The weather con so far this season have been favorable for logging ations, but it is too early to make any predictions winter. The stock wintering here has not yet been up, but so far as we can judge, it will be about the as last year. The preparations for logging are twenty per cent. less than last season, but if we favorable weather this may be slightly decrease only slightly, as men are very scarce, and wages a twenty per cent. over last year's rates. The price visions is generally higher, and the outlook fo season's European markets is not bright.

J. B. SNOWB

SHEDIAC, N. B., Nov. 21st.—I can hardly expr opinion as to the quantity of lumber this district wi duce for next season's shipment, but it seems pretty generally conceded that the high prices past year will not be maintained during the next s hence my opinion is that operators will not go in same extent as last winter—we at least shall not o as heavily. Labor is at least 15 per cent. highe last year, supplies somewhat higher, and the weat this part of the province not encouraging at pres yarding logs.

E. J. SM

BRANDON, MAN., Nov. 17th.—We are now bus the camps and intend sending in two hundred m winter. We are counting on taking out about 8,0 feet this year, 4,000,000 feet from each camp. W out 7,000,000 feet last year, so you see we intend crease our output by 1,000,000 feet. Things at t sent are looking very favorable, there being at th of writing a nice fall of snow, which will enable commence logging at once. We think the suppli average us about the same as last year. Oats point will be somewhat scarce. The lumber trade district has been very slow for the last three m owing to the shortage of crops and bad weathe

ow on hand about 4,000,000 feet from last year's
t we hope it will be all out of our yard by the time
v logs arrive, as March and April are our best
g months.

THE HANBURY MANUFACTURING CO.

TSVILLE, ONT., Nov. 24th.—Logging operations are
e same scale in this district as they were last year,
n are scarce and wages high, which may reduce
eral output in this section. The weather of late
s caused serious delay with the camp work.
g it all through, it does not at present look as if
quantity of logs will be got out.

HUNTSVILLE LUMBER COMPANY.

NDON, MAN., Nov. 13th.—Owing to the poor crop
nsequent small demand for lumber, stocks in the
re very heavy, and in our opinion logging opera-
vill be considerably curtailed this season. Sales of
are slow at present. The weather has been fine
cently, when we had a general freeze up, with
r less snow, and so far as the weather is con-
, the conditions could not be more favorable for a
eason's work. The labor question may also make
ifference in the volume of business done in the
s. Wages are high, from $20 to $45 per month
paid, which price, of course, includes board.

HUGHES & LONG.

COUVER, B. C., Nov. 19.—In reply to your enquiry
ing logging operations in British Columbia for this
, as you probably already know, the great bulk
logging on this coast is done during the summer
—the winter season being so rainy that work in
ods cannot very well be carried on to advantage.
the last few years, however, a number of the
cargo mills, in fact all of them, have been taking
ir logs altogether by machinery, so that they have
ble to carry on work in weather in which teams
not work to any advantage. The mills which
een thus equipped have been able during the last
ars to secure a more steady supply of logs the year
h. The mills generally plan to have a consider-
tock of logs in the water at the beginning of
ny season, so that with what they can get out
the winter they will have sufficient to keep running
ing again. At the present time, and during all
ar, there has been a plentiful supply of logs, and
t prospects indicate that enough logging will be
his winter to keep those mills well supplied which
ufficient orders to keep them running. Loggers'
and cost of supplies are about the same as during
st two or three years. We have just had a fall of
six inches of snow, which is quite unusual here at
ne of the year. This will retard, rather than help
n the woods, as it has fallen on soft ground. I
dd that the cargo mills in British Columbia, as
those on Puget Sound and in California, are short
ers at the present time. This condition has pre-
during the last two or three months. I may also
hat the British Columbia mills are considerably
apped on account of no lumber carrying ships
owned in British Columbia, making it difficult to
charters.

H. H. SPICER.

SHIPBUILDING IN BRITISH COLUMBIA.

following letter, on the important subject of ship-
g in British Columbia, appears in a recent issue of
ews-Advertiser, of Vancouver. The writer is super-
ent of the Moodyville Land and Saw Mill Company:

—The recent and much needed agitation by our
of Trade and business men generally, of the ques-
of placing suitable steamers on the Vancouver-
way route, calls up the somewhat larger and
ly more important subject—that of ship-building
Province. It is doubtful, however, if the necessary
l for such work can be secured at the present time
rivate sources only, and this being the case, it is
lesirable that our Provincial Government should
nancial aid to the enterprise, to just what extent
what particular way can be left to future consider-
The general way, however, for such aid to be ex-
d, is by giving a certain sum per ton register for
ing vessels, and so much per mile for distance
led during the first two or three years of a ship's

It is doubtful if there is another seaport, either in Canada or the United States, of the importance of Vancouver, that has not more or less of a locally owned fleet. That a number of vessels, built and owned in and operated from this port, would be a great advantage to all classes of our citizens, can scarcely be questioned. Being somewhat interested in shipping, I have had occasion to note the many disadvantages the port labors under, owing in a great measure to the fact that we have no vessels of our own. I will just give one illustration. A great many of the vessels loaded in British Columbia with lumber are owned either in San Francisco or Puget Sound—the owners in many cases being closely allied with the owners of the Sound mills. The natural result follows, and every American ship-owner does his utmost to have his ships go to Puget Sound, and in order to do this many owners grossly exaggerate the difficulties of coming to Burrard Inlet, and actually state in the Charter Party that if the ship goes to Burrard Inlet, the freight will be 60 cents per thousand feet more than if loaded in Puget Sound. In many cases our mills cannot possibly afford to pay the 60 cents extra, and the vessels go to the Sound—our people lose the orders and many times are compelled to close their mills, which, of course, affects every man with whom they have business relations.

I mention lumber carriers particularly, as for the present lumber is the principal export; but it is only a question of time when this discrimination against the port will spread to all other freight, both in and out. Let both the Provincial and Dominion Governments give their aid to ship-building, and the whole Dominion will benefit by it. I trust that persons more competent to handle the subject (to say nothing of the governments) than I, will take it up and give it their earnest attention.

J. G. WOODS.

MOODYVILLE, Nov. 17th, 1900.

LOG RUN OR CULLS?

A peculiar controversy has arisen between a buyer and seller of lumber and has been brought to our attention.

A dealer bought of a manufacturer a certain lot of lumber "log run." The National inspection rules defines "log run" as "the full run of the log mill culls out." The buyer had not seen the lumber when he made the contract and when the lumber came to be delivered it was found that almost every board was missawn and badly missawn. The rules say that all badly missawn lumber shall be classed as "culls," the word "culls" evidently having reference to shipping culls. Now, the question arises, is the dealer bound to take the lumber as log run?

It seems to us that he is not. When a dealer buys lumber "log run" he takes his chances as to the quality of the logs, but he is entitled to have the manufacturer use ordinary diligence to properly prepare the lumber for market. No matter how poor the quality of the logs, if the dealer had contracted log run, and the manufacturer had properly manufactured the logs into lumber, the dealer would have been compelled to take it, even had it been all culls. When, however, the lumber is made all culls through the negligence of the manufacturer, or his inability to properly manufacture it, then the dealer cannot be compelled to take the lumber as log run.

The rules say that log run is the full run of the log mill culls out. To our way of thinking, that does not only mean the full number of feet in the log, but also the proportion of high grade stock which the logs would produce with reasonable care in the manufacture. When, however, the buyer fails to receive the proportion of high grade stock which is in the log, either because it has been selected out by the manufacturer or because through negligence on the part of the manufacturer the high-grade stock is reduced to cull, the buyer is not getting the full run of the log.

In a certain lot of logs, if reasonably well manufactured, there are a certain number of feet of firsts and seconds, a certain number of feet of common and a certain number of feet of culls, the value of all being, say, $5,000. When through gross negligence on the part of the manufacturer the logs produce nothing but culls, valued at, say, $3,000, then the buyer is falling $2,000 short of getting that which is his due.

The case will probably be decided in the courts, and we believe the foregoing position will be sustained.—Hardwood Record.

BRITISH COLUMBIA LUMBER SHIPMENTS.

The following vessels sailed from British Columbia ports, lumber laden, for foreign destinations, up to October 31st, 1900:

Vessel.	Sailed	From.	For.	Cargo-ft.
Latona	Jan. 9	Moodyville	Valparaiso	788,359
Guy C. Goss	Jan. 19	Hastings	Philadelpia	1,030,625
Altcar	Jan. 19	Moodyville	Callao	992,307
Fred J. Wood	Jan. 24	Esquimalt	Santa Rosalia	14 440
Antofagasta	Feb. 28	Chemainus	Antofagasta	8 0,454
Errol	Mar. 10	Hastings	U. K.	1,069,195
Creedmoor	Mar. 30	Ch mainus	U. K.	1,156,540
Star of France	Mar. 20	Hastings	Sydney	1,180,293
Silo	Mar. 31	Chemainus	U. K.	1,166,308
Adderly	April 5	Moodyville	Sydney	1,080,349

TRADE ENQUIRIES.

Mr. C. A. Duff Miller, Agent General for New Brunswick, 17 Leather Market, London, Eng., has received a communication from a Glasgow merchant who wishes to represent a Canadian pulp manufacturer.

The secretary of the Canadian Manufacturers' Association, Toronto, is in receipt of a communication from the Imperial Institute, asking for the names of manufacturers of wooden handles. The name of a large firm in Manchester is furnished as desirous of buying these in large quantities, and as Canada has direct steamship service to Manchester, the prices would be quoted at a very reasonable rate. Along with the request came three samples of the sort of handles required, so that any manufacturers interested can call at the office of the Manufacturers' Association, Board of Trade building, and be able to place exact figures for the supply of these goods. The secretary is also in receipt of an enquiry for manufacturers of hardwood blocks for flooring.

A Glasgow firm of timber importers desire to be placed in communication with Canadian firms in a position to supply quantities of boxwood. Name and address at office of CANADA LUMBERMAN.

A manufacturing firm using large quantities of dimension hardwood timber invites communications from Canadian manufacturers. Particulars from Mr. Harrison Watson, Imperial Institute, London, Eng.

HARD TO BEAT.

Mr. E. Todd, Brantford, Ont., in renewing his subscription, writes: "You will have to hustle next year if you expect to beat this year's LUMBERMAN."

It is rumored that a pulp mill will be established a Nanaimo, B. C.

CANADA LUMBERMAN
WOOD WORKERS MANUFACTURERS AND MILLERS' GAZETTE

MONTHLY AND WEEKLY EDITIONS
PUBLISHED BY
The C. H. Mortimer Publishing Company
of Toronto, Limited
CONFEDERATION LIFE BUILDING, TORONTO
BRANCH OFFICE:
IMPERIAL BUILDING, MONTREAL

The LUMBERMAN Weekly Edition is published every Wednesday, and the Monthly Edition on the 1st day of every month.

TERMS OF SUBSCRIPTION:
One Copy, Weekly and Monthly, One Year, in advance..... $1.00
One Copy, Weekly and Monthly, Six Months, in advance..... .50
Foreign Subscriptions, $2.00 a Year.
ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in anyway affecting it. Even when we may not be able to agree with the writers, we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

THE LABOR PROBLEM.

THE difficulties which confront the lumber manufacturer in respect to labor are showing no indications of relief. Logging operators in many instances are unable to obtain a sufficient number of men for work in the woods, and the production of logs during the coming winter promises to be reduced on this account. Some dissatisfaction is also reported as to the class of labor obtainable.

The demand for labor is such that employees are often indifferent and do not discharge their duties as faithfully as when employment was less plentiful. These conditions must affect the cost of producing lumber.

The opinion was recently advanced in these columns that current prices are not out of proportion to the cost of producing lumber. In a recent issue the American Lumberman takes up this question and gives some striking examples of the increase in the wages of those engaged in lumbering operations. Taking the wages paid by a large lumber manufacturer in Duluth, the increase this year as compared with 1896 is about 30 per cent., as the following table shows:

CLASSES OF LABOR	1896	1900	INCREASE.
Pilers	$1.62	$2.00	23 per cent.
Graders	1.37	2.00	46 " "
Setters	1.75	2.00	14 " "
Clearing gangs	1.75	2.12½	21 " "
Common laborers	1.25	1.62½	30 " "

The increase in the wages of woodsmen have been much greater, and show an increase as compared with four years ago of nearly 85 per cent. The comparison is as follows:

CLASSES OF LABOR	1896	1900	INCREASE.
Teamsters	$16.00	$30.00 to $40.00	88 per cent.
Swampers	13.00	28.00 to 32.00	115 "
Choppers	14.00	28.00 to 32.00	100 "
Sawyers	14.00	28.00 to 32.00	100 "
Graders	13.00	28.00 to 32.00	115 "
Laying iron	13.28	28.00 to 32.00	110 "
Chore boys	12.00	20.00 to 26.00	76 "
Blacksmiths	35.00	50.00 to 60.00	43 "
Cooks	45.00	50.00 to 60.00	11 "

We believe that in Canada there has been an almost corresponding advance in the wages of the employees of the lumber trade. This advance cannot be disregarded by manufacturers, who must of necessity secure for their product a price sufficient to cover the increased cost of production. The consumer who believes that by waiting he will be able to purchase his supply of lumber at lower prices will probably find that he has been laboring under a delusion.

THE OUTLOOK.

As the exponent of the lumber industry, the CANADA LUMBERMAN has felt an interest in the election campaign which recently closed in the United States, and we must confess to a feeling of satisfaction with the result. No doubt the prosperty which the country has enjoyed during the past three years was a strong factor in determining the result. The business interests are now assured that there will be no change in the policy of the Government for four years at least. The immediate result will be the carrying out of plans which were temporarily deferred, while the commercial industries will continue to expand.

Although a political campaign in Canada does not affect the business interests in the same degree as in the United States, yet it is a cause for congratulation that in this country also we are now reasonably certain of a settled policy for another four years. Tariff regulations are not likely to undergo material change, and manufacturers will be in a position to plan their undertakings accordingly.

THE lumber trade has perhaps felt a greater interest in the recent election across the border than any other branch of industry, as some 500,000,000 feet of the lumber product of Canada is annually marketed in the United States. A prospective glance shows the outlook for the lumber industry of this country to be rather bright. Lumber is still a large factor in building operations. These will soon be terminated for this year, but we anticipate that the spring of 1901 will be the beginning of an active building season. In the city of Toronto the number of vacant houses has greatly diminished within the past year, and the demand is such that new residences must be built to accommodate the rapidly growing population. The holding of a Dominion Exhibition in Toronto next year is likely to cause the erection of buildings on the Exhibition grounds to cost in the neighborhood of $200,000, while the proposed palace hotel on King street is expected to call for an expenditure of nearly $1,000,000. In Ottawa building operations next year promise to be on an extensive scale, as, in addition to the regular building, many structures destroyed by the Ottawa-Hull fire last spring are yet to be replaced. A considerable volume of building is likely to be done in the city of Montreal, not to speak of the extensive harbor improvements which are under way in that city. We believe the conditions in these three cities reflect the situation in the smaller cities and towns and in the country, and that we shall experience a healthful revival of building operations next year.

THE consumption of lumber for manufacturing purposes is likely to increase. Furniture and implements are two of the main branches of manufacture in which lumber is employed, and both of these are in a most prosperous condition. In addition to a steadily increasing home demand, the export of these articles is increasing, as shown by the official returns issued by the Department of Trade and Commerce.

So much for the home consumption. The condition which will characterize the export trade are less certain. It is not improbable that the United States will take from this country next year fully as much, if not more lumber, than the season now closing. So with the British market. And it is probable that other importing countries will increase their imports from Canada, partly as a result of our exhibit of forest products at the Paris Exposition. The South African Republic will eventually be a large importer of lumber, but the country will not have become sufficiently settled to permit of large imports in 1901.

Lumber manufacturers may, we think, look into the future with some degree of assurance that, with a moderate output, all the lumber manufactured will find a market, and that the business will realize a fair margin of profit. One of the things to be guarded against is an excessive production.

EDITORIAL NOTES.

TO THE lumber fraternity the CANADA LUMBERMAN extends its greetings upon the approaching festive season.

HERE is a trade barometer: "The quantity of wood pulp exported from the Dominion of Canada to Great Britain during the last fiscal year was almost twice as great as during the preceding year." The Scandinavian manufacturers are gradually losing ground in the British market, because of the superior quality of Canadian pulp.

NEW blood from lumber circles has been introduced into the Dominion parliament by the election of Mr. J. T. Schell, of Alexandria, Ont., and Mr. Gibson, jr., of Marysville, N. B. If these gentleman put into their parliamentary career the same keen foresight and telling energy that characterized their business operations as lumbermen, we may expect to see the mark of their impress upon the work of the ninth Parliament of Canada. Is it too much to predict the imposition of the long-looked-for import duty on United States lumber?

THE Great Northern Railway has been completed. The road runs from Quebec City to Hawkesbury, connecting with the Booth railway system, over which it has running privileges to Parry Sound. It passes through the richly timbered country on the upper reaches of the streams that flow from Quebec into the St. Lawrence and furnishes a continuous line between

Georgian Bay and tide water at Quebec. The road is of much importance to the pulp industry, as mills are located at many points through which it passes, including Hawkesbury, Lachute, St. Jerome, Grand Mere, and Shawinigan. The construction of the road opens up bright prospects for pulp and paper-making, as well as for the city of Quebec.

THE suggestion recently made in these columns that railroads might be employed to a much greater extent in the near future for the transportation of logs from the woods to the mills is practically illustrated in some parts of the United States. It is learned that in Michigan and some other states where a few years ago logs were floated to the point of manufacture, railroads are now used for this purpose. It is also significant that a strong syndicate is planning to ship by rail 1,000,000,000 feet of logs from the Rainy River country to Stillwater, Minnesota.

WE are again reminded of the one great want of the lumber trade in Canada by the receipt of a little booklet giving the rules for the grading of pine and hemlock lumber as adopted by the Lumbermen's Associations of the Mississippi and Wisconsin valleys. A glance at the rules shows that they have been prepared with more than ordinary care. The general instructions are intended to cover points upon which opinions are likely to differ, while to make the rules more explicit several examples of each grade are given. These rules apply to 95 per cent. of all the white pine and Norway lumber manufactured in the Mississippi and Wisconsin valleys. It is to be regretted that in the matter of uniform grading of lumber, Canadian manufacturers have not shown as much progress as their confreres in the United States. One has but to examine the different stock sheets as sent out by manufacturers to at once be convinced of the great necessity of the adoption of some such rules. No two mills grade their lumber in the same manner.

DAMAGES FOR ACCIDENT.

Blow vs. London and Petrolia Barrel Company came up in the Divisional Court at Toronto, before Mr. Justice Falconbridge, on motion by defendants to set aside verdict of jury and judgment of Mr. Justice Meredith, and for new trial. The case was an action for damages at law and by statute for injuries sustained by plaintiff, who while employed by defendents and acting under the directions of one Weir, his superior, and removing waste near a circular saw in motion, had his left arm cut off. The plaintiff alleged negligence on the part of defendants in leaving the saw unguarded, and in not having a proper mode of ingress to and egress from it. The jury did not agree upon an answer to the first question, which was whether Weir gave the direction to plaintiff, which plaintiff says he did, to approach the saw by a certain way, and as to the second, found that the saw was unreasonably dangerous, because not properly covered, and that plaintiff was entitled to $500 damages. It was contended for defendants that the jury not agreeing to a general verdict, and in the absence of a finding that Weir had given an improper order, that plaintiff could not succeed. Held, that the jury have found in effect that the saw was not securely guarded, and that by reason of the defendants' neglect to guard it the plaintiff was injured, and that their finding involves a finding that plaintiff was properly where he was when the accident happened, and the motion should therefore be, and is, dismissed with costs.

LOGGING MAHOGANY.

THE following somewhat lengthy description of the mode of of logging mahogany is taken from Self Culture. It is worth reading :

"The mahogany hunter is the most important and best paid laborer in the service, for upon his skill and activity largely depends the success of the season. Mahogany trees do not grow in clusters, but are scattered promiscuously through the forests, and hidden in a dense grow of underbush, vines and creepers, and it requires a skillful and experienced woodsmen to find them. No progress can be made in a tropical forest without the aid of a machete, for the way must be cut step by step. The mahogany is one of the largest and tallest of trees, and the hunter, seeking the highest ground, climbs to the top of the tallest tree and surveys the surrounding country. His practiced eye soon detects the mahogany by its peculiar foliage, and he counts the trees within the scope of his vision, notes directions and distances, and then, descending, cuts a narrow trail to each tree, which he carefully blazes and marks, especially if there is a rival hunter in the vicinity. The axemen follow the hunter, and after them come the sawyers and hewers.

"To fell a large mahogany tree is one day's task for two men. On account of the wide spurs which project from the trunk at its base, scaffolds must be erected and the tree cut off above the spurs, which leaves a stump from ten to fifteen feet in height—a sheer waste of the very best part of the tree, and one which American ingenuity would certainly devise some means to prevent. While the work of felling and hewing is in progress other gangs are busy making roads and bridges over which the logs may be hauled to the river. One wide 'truck pass,' as it is called, is made through the center of the district occupied by the works, and branch roads are opened through this main avenue to each tree. The trucks employed are clumsy and antiquated affairs which no American would think of using ; the axles and boxes are imported from England, while the other parts are made upon the ground. The wheels are of solid wood, made by sawing off the end of a log and fitting iron boxes in the center, no spokes or tires being used. New wheels are in constant requisition, and repairs cause frequent and expensive delays. Most of the trucking is done at night by torchlights of pitch pine. The oxen are fed on the leaves and twigs of the bread-nut tree, which gives them more strength and power of endurance than any other obtainable food. The trucking being done in the dry season, the logs are collected on the bank of the river and made ready for the floods. On the longest rivers these begin in June and July, and on others in October and November. The logs are turned adrift and when they reach tide water are caught by means of booms. Indian loggers, usually Caribs, follow the logs down the river in order to release those which are caught by obstacles. No little judgment and experience are required to determine at what exact stage of the flood the logs should be set adrift. Should the waters rise to what is called 'topgallant flood' before the logs reach the boom, many of them would be carried over the banks and left high and dry in canebreaks and thickets, or covered up by sand and rubbish. From the boom the logs are rafted to the embarcadero and 'manufactured' for shipment.

"Mahogany trees give them from two to five logs each, measuring from 10 to 18 feet in length and from 20 to 44 inches in diameter after being hewed. The manufacturing process consists in sawing off the log ends which have been bruised and splintered in transit down the river, and in relining and rehewing the logs by skillful workmen, who give them a smooth and even surface. The logs are then measured, rolled back into the water at the mouth of the river, and made into rafts, to be taken to the vessels anchored outside the bar."

LACING A BELT.

A writer in The Engineer suggests a new method of preparing the ends of the belt lacing, concerning which he says: Every one who has to lace belts knows how difficult it is to push the soft ends of the lace through the belt, unless the holes are much larger than they should be. The majority of men use either a nail or the point of a file to aid in this work, but this is cumbersome, and, too, a nail of the proper size or a file is not always on hand. There are metal tipped laces and also metal tips on the market, which are adapted to cover the end of the lace and thus make it stiff enough to be pushed through the holes in the belt, but I believe my method is superior to either of those already mentioned, inasmuch as it is more of a time saver. My method consists in holding the tapered ends of the lace leather over a lighted match until the leather becomes charred, when it will be found to be quite hard, and plenty stiff enough to be pushed through the holes in the belt without breaking. Care should be taken not to char the leather too much, otherwise it will become brittle. A little experimenting will enable the work to be done just right.

TREATMENT OF RUBBER BELTS.

To obtain the full value from a rubber belt, it is essential to buy the best belt, provide pulleys of ample diameter and face, avoid excessive strain, distribute the strain over the whole width of the belt as equally as possible, have the fastenings made so that they will not pull out the ends of the belt, and avoid having the belt exposed to excessive heat or to grease or dirt. You can greatly increase the service and life of a belt by applying with a brush a composition made with equal parts of red lead, black lead, French yellow and litharge mixed with boiled linseed oil and japan, enough to make it dry quickly. This will produce a finely polished surface. A coat of the same composition may be applied if the rubber gets peeled from the surface of the belt. Animal oils, grease and castor oil are injurious to rubber belts and should not be used, the composition mentioned above being all that is necessary. Belts to be adjusted to the pulley should have the ends cut square and true, and be cut shorter than the distance around the pulley by an 1/8 to 1/4-inch for every foot when measured with a tape ; a steel tape is the best. They should be stretched as tightly as possible, and with wide belts this can be done best by the use of clamps secured firmly to each end of the belt. There is no danger of breaking, as a belt of good quality, 6 inches wide and 3-ply thick, will stand a direct strain of 5,000 pounds.—Steam Engineering.

Mr. A. F. Bury Austin, the well known lumber merchant, of Montreal, left for British Columbia on November 19th, on an extended business trip. Upon his return he will be pleased to receive enquiries for all kinds of material in his line.

NOTES FROM THE EASTERN PROVINCES.

[Correspondence of the CANADA LUMBERMAN.]

A new company has been formed in Fredericton, N.B., for the manufacture chiefly of lumbermen's supplies, including peavies, hames, cant dogs, boot caulks, table blocks, all kinds of drop forgings, wire nails, hay pitchers, etc. The name of the concern is the McFarlane-Neill Mfg. Co., and it starts out under particularly advantageous circumstances. The firm has acquired the fine plant of the late Walter McFarlane, which was so successfully run by him up to his death, and since then with continued success by Mrs. McFarlane. This plant consists partly of a large brick building in St. Marys, just opposite Fredericton, fully equipped with engines and the best machinery. This old concern has a first-class name among the lumbermen and a good connection with them. Their peavies have for years been shipped all over the Maritime provinces and central and western Canada. One customer alone in Quebec has bought over $5,000 worth of peavies. The personnel of the new company is as follows: Mrs. W. McFarlane, Jas. S. Neill, E. Byron Winslow, F. T. Morrison and N. A. Tweedale, the latter being manager. Mr. Jas. S. Neill is well known among lumbermen, having, in Fredericton, one of the best hardware stores in New Brunswick, from which he has shipped large quantities of lumbermen's supplies. For years he has manufactured boot caulks in a little factory at Nashwaaksis, for which he has found a large market. New equipment is at once to be added to this factory on account of increased output. The concern is the only one in Canada which manufactures the celebrated wrought band and solid eye peavy. For this they hold the Canadian patent, which was taken out by the inventor, the late Walter McFarlane, who made a good thing out of it and sold the United States patent to a Bangor firm. They also manufacture the malleable band peavy such as is made by Upper Canadian firms. To give a slight idea of the extent of this business it may be mentioned that in this factory upwards of 90 carloads of lumber are sawn into peavy handles each year. This lumber is hauled to the factory in the rough log, and there sawn and split in order to get the green of the log.

Thos. Robinson, a well-known mill owner, died a few days ago at his home in Lower St. Mary's, N.B. For many years he successfully ran the saw mill which he recently leased to Alderman McKendrick.

The Robb Engineering Company, of Amherst, N. S., secured the order a few days ago for a large and heavy portable saw mill, with engine and boiler and all appurtenances complete, to be shipped to the Pacific coast. It is destined to the Chilliwack valley in British Columbia. The freight on this purchase will be between $800 and $1,000. This mill has been bought by Clifford Paterson and some other lumber operators of this county who have organized to carry on a big lumber industry in the west. The men to man the mill will probably accompany it across the continent.

C. Pickard, of Sackville, has a portable mill at Brooklyn, some miles distant on the Cape Tormentine Railroad, and cuts from one to one and a half million feet of spruce a year, which goes to the English market.

Jas. Smith, of Sackville, has lately been turning out between 10 and 15 thousand pairs of moccasins in a season. These are oil tanned. He has been steadily refusing orders for some time, as the capacity of his factory is not equal to the demand. He employs 35 hands and does a huge trade in these lumbermen's goods.

P. R. Ayer & Company, Limited, in the same town, make enormous quantities of lumbermen's harness, which is now their specialty. Their factory is the largest of the kind in the Maritime provinces and one of the best in Canada.

Jas. F. Sherry has opened up in Memramcook in the manufacture of lumbermen's shoe pocks, moccasins and larrigans. He is employing about 20 hands and makes a good article. His specialty is shoe packs. Next year he hopes to have about 50 hands at work.

A. E. Wry & Co., Sackville, are manufacturing lumbermen's harness, and showed THE LUMBERMAN'S representative substantial orders from well known lumbermen and dealers from the north.

Chas. Dickenson, the larrigan manufacturer in Woodstock, whose advertisement is seen elsewhere in this issue, has a pair of shoe packs in his possession which were worn from Cape Town to Pretoria and back by the Rev. Mr. Lane, who accompanied the first contingent. They are neither worn through or ripped in any part, but show many deep scratches and cuts from the rocks.

The second largest larrigan factory in Canada is in Parrsboro, and lumbermen throughout eastern Canada know the name of J. S. Henderson so well that they will be interested in a short description of his business. It is but a few years since he began to manufacture on anything approaching a large scale, but already his business is enormous and he now employs about seventy-five hands and turns out 32 dozen pair a day of shoe packs and larrigans, not including moccasins. Mr Henderson has his own tannery in connection which he has been running for many years and makes up all his own leather, so he knows exactly what goes into his goods. His larrigans and shoe packs all have the rivet through the vamp and quarter on each side; this, he claims, is an absolute essential to lasting quality, and it looks most reasonable. Some makes are without this important feature. A large addition was recently added to the factory, and another spring further additions will go up. Mr. Henderson last February sold in one order, to a Montreal firm, 26,000 pairs. He has sent large shipments to Winnipeg and British Columbia. His advertisement may be seen in this issue, and THE LUMBERMAN trusts that soon Mr. Henderson will occupy no second position in Canada. T. E. Henderson, of Parrsboro, is the inventor of the Henderson patent larrigan which is gaining such a good reputation. A pair of these is on exhibition in his shoe store window, made to the order of Chaplain Lane, of the first contingent, for presentation to the Prince of Wales.

PARRSBORO'S LUMBER INDUSTRY.

It may not be generally known that Parrsboro ships one-quarter of the entire lumber output of Nova Scotia, but there are many interesting things to be learned of this progressive and always busy little town, which is harbored so securely on the northern shore of the beautiful Minas Basin. At an early date THE LUMBERMAN hopes to publish some interesting sketches and descriptions of the town and vicinity relative to the lumber industry, but at present a few items will give the trend of recent events in this connection. Backed by a great lumber district, intersected with splendid carrying facilities, fronted by much good shipping conveniences and peopled by men who know their business, Parrsboro has been doing, and will continue to do a heavy export trade. The town is growing and growing well as the years go by.

The Newville Lumber Co., whose mill is 10 miles from Parrsboro, on the Cumberland railroad, have been cutting about 4,500,000 feet. The mill is equipped with a gang, edger, trimmer, lath, planer and other machines. About 700,000 feet of this cut is of pine. They stream drive largely to the mill. The office of the firm is in Parrsboro, in charge of Mr. McAloney, who greatly admires THE LUMBERMAN. They sell largely to Malcolm Mackay and ship much to the United States; Stetson, Cutler & Co. handling most of this. The firm is composed of W. W. Black, N. A. Rhodes, N. Curry, C. A. and J. B. Lusby, and George A. Fowler. These men are from Amherst, with the exception of Mr. Fowler, who is now in Newoundland as manager of the Exploits Lumber Company there. Captain Nordby, of Parrsboro, agent for George McKean, of St. John, shipped about 12,320,000 feet this year.

D. A. Huntley, manufacturer and shipper, has a mill on the wharf in which he cuts about 1,000,000 feet a year. As he does a good deal of vessel building he uses it for getting out deck planks, etc. He is just now building a 500 ton barque. He has another mill at Canaan, 10 miles north east of Parrsboro; he cuts about 1,000,000 deals a year. He has also stave, shingle, and heading machines. He sells principally to George McKean and B. L. Tucker.

Geo. W. Day, of Parrsboro, at present Mayor of the town, has a portable mill at Canaan, and cut about 2,500,000 feet of deals, boards and scantling last year. Mr. Day knows the lumber business thoroughly in all its features, and has been very successful.

The Moose River Lumber Company has been organized during the past month at Parrsboro, and will now carry on a large business. The gentlemen interested in this concern are Messrs. B. L. Tucker and Newton Pugsley, of that town. They have bought a property consisting of 12,000 acres of well wooded land lying about east of Parrsboro on the northern shore of the Basin of Minas. This property has been cutting from 2,000,000 to 3,000,000 feet for years. They expect to cut that much this year, using portable mills and doing considerable stream driving. Mr. Tucker, as buyer and shipper of lumber, handled 20,000,000 feet last year, shipping from West Bay to the English market. He does not ship to the American market.

Chas. J. Willis & Company, of Sackville, N. B., have shipped some 40 cargoes of lumber since April. A steamer was due there on the 15th of November, which was to take away 1,5000,000 more—the last of the season's shipments. This firm ships from Cape Tormentine, Halifax, Shediac, Pugwash, Grindstone Island and other points. In 1900 they shipped over 55 million feet. Mr. Atherton leaves this office early in December to return to England.

The barkentine Florence B. Edgett, loaded with 510,000 feet of lumber, for Cape Town, sailed recently from Parrsboro, N. S. Nearly all of this is to be used in repairing the mines and railways wrecked in South Africa. The commander of the vessel is Captain J. N. Kay, who was but a few weeks ago married to Mi s Germaine Stehelin, of New France, near Weymouth, N.S., who accompanied her husband on the trip. Mrs. Kay's father is the well-known lumber operator at New France.

Nov. 18th, 1900.

QUESTIONS AND ANSWERS.

"C. B.", Halifax writes: I have two lines of shafting to be driven from one electric motor. Can I run two belts off it, or will I have to belt from one line of shafting to another?

ANS.—If you have room to put your motor between the two lines, it would be best to belt direct from it to each line, the belts driving each way from a special pulley having two crowns. This method has the advantage over the one in which a pulley is used at each end of the motor, of reducing the strains on the bearings and frame, and also of giving freer access to the motor for inspection and cleaning.

"Engineer" says: We are putting a new engine in our mill, for which we will have to get a new belt about fifty feet long. As I want to get the very best service possible out of it, please advise me which side I should put next the pulley.

ANS.—If your belt is to be single, you should run the flesh or grain side out, because the outside of the belt when passing around the pulleys is subject to more or less of an extension strain, over and above the strain due only to the load it is driving; whereas the inside of the belt as it goes over the pulley is to a certain extent compressed; obviously, the flesh side being of a more soft and pliable nature than the hair side, is more suited to take the extension strain. If the belt is double, both sides will be grain, the hair sides being glued together, so you will have no choice in the matter.

SNEEZE WOOD.

Among its many peculiarities South Africa includes the "sneeze-wood" tree, which takes its name from the fact that one cannot cut it with a saw without sneezing, as the fine dust has exactly the effect of snuff. Even in planing the wood it will sometimes cause sneezing. No insect, worm or barnacle will touch it. It is very bitter to the taste, and its specific gravity is heavier than water. The color is light brown, the grain very close and hard. It is a nice looking wood, and takes a good polish. For dock work, piers or jetties it is a useful timber, lasting a long while under water.—The Building News.

PERSONAL.

Mr. Joseph Botsford, foreman in the planing mill of Graham, Horne & Company at Fort William, Ont., was stricken with paralysis last month and died a few days thereafter.

The marriage of Mr. J. Quincy Adams, of Kearney, Ont., inspector for the British-Canadian Timber and Manufacturing Company, of London, Eng., should have been chronicled in last issue. The lady of his choice was Miss Maud Minerva, daughter of Mr. W. E. Roberts, of Harriston, and the event took place at St. George's church at Harriston, Rev. J. Hirst Ross officiating. To Mr. and Mrs. Adams we extend our congratulations.

Limits and Saw Mills FOR SALE

The proprietors having decided to retire from this business, offer their Valuable Limits and Mills for sale. The concern is well equipped in every respect and is in operation. The cost of operation is very moderate, having about 30 miles of railway (Lake St. John) running through it. The Mill at Lake Edward is Circular Saw; that at Pearl Lake is Steam Feed Circular and Gang.

The Limits, about 280 miles, have considerable Spruce and Pulp Wood, also Boule u and Birch. These latter have exceptionable quality, and by judges considered the best in the Province of Quebec. For terms, etc., apply to

WHITEHEAD & TURNER,
Quebec City

AUCTION SALE

— OF —

Valuable Timber Limits, Saw Logs, Timber Lumber and Lumbering Appliances

Pursuant to the powers contained in two certain agreements each made by Joseph Turner and Spencer O. Fisher, of Bay City, Michigan, trading in co-partnership under the name of Turner & Fisher, and the Bank of Toronto, and to certain securities given under Section 74 of "The Bank Act," and pursuant to all other rights and powers of the said Bank of Toronto thereun o them enabling, there will be offered for sale by public auction, at the auction rooms of C. J. Townsend, No. 28 King street west, in the city of Toronto, on SATURDAY, THE EIGHTH DAY OF DECEMBER, 1900, at the hour of 12 o'clock noon, all those certain timber berths or limits following:

The entire Township of Wilson and Concessions Nine (9), Ten (10), Eleven (11) Twelve (12) Thirteen and Fourteen (14), in the Township of Ferrie, in the Province of Ontario, being the berths covered by License No. 46, of the season of 1896-1897, and License No. 89, for the season of 1895-1896, and being covered by Crown Timber Licenses Numbers 44 and 45 of the season of 1900-1901. And also the timber limit known as Berth No. 53, on the north shore of Lake Huron, in the said Province of Ontario, which was covered by Crown Timber License No. 145, for the season of 1895-1896, and being covered by License No. 46 for the season of 1900-1901, together with all rights of the said the Bank of Toronto in and to the said licenses.

Also all the saw logs and timber marked B. T., T. N. R., and J. O.E., or any one or more of the said marks, and all wood and wood products, including lumber, lath, shingles, the product of such logs, in, upon or near the land and waters and premises known as timber berths Township of Wilson and Township of Ferrie, on the north shore of Lake Huron, in the Province of Ontario, and in, upon or near lands and waters adjacent to the said timber berths and in transit in, upon and near any lands and waters between the said timber berths or either of them and the lands and waters at the mouths of the French River and of the Magnetewan River, or of either of said rivers, and in, upon or near the lands and waters at the mouths of the French and Magnetewan Rivers, an in either of said rivers, in said Province of Ontario, and in transit in, upon or near the waters and shore of Georgian Bay and Lake Huron, between the said mouths of the said French River and of the Magnetewan River, and of either of the said rivers, and the saw mills situate at or near the town of Midland, in the County of Simcoe and Province of Ontario, known as "Chew Bros. Saw Mills," "James L. Playfair & Company Sawmill," "Cameron & Playfair Sawmill," and George Chew and Son Sawmill," or any of the said sawmills, and in, upon or near the lands and waters connected with or adjacent to the said sawmills or any of them, including the booming grounds, mill ponds, mill yards, piling grounds at or near the Town of Midland aforesaid, together with all the plant and appliances and camp equipage used upon and in connection with the lumbering of said limits in the Townships of Wilson and Ferrie, including all camp equipage, horses, wagons, sleighs, chains, lumbering tools and appliances of all kinds on said limits of Wilson and Ferrie, and on the Forsythe Farm, in the Township of McConkey, all store supplies and tools of all kinds at Turner's store house at Trout Creek, all booms, boom chains, boats, rafts, and outfit for taking logs down the Pickerel and French Rivers, and all chains, boats, tools, horses, wagons and lumbering outfits the property of the said Turner & Fisher, or of the Bank of Toronto, used in connection with the lumbering operations of the said limits at the Town of Midland, or in transit from the said limits, and upon the waters and shores lying between the said limits and the Town of Midland, in the County of Simcoe, a schedule of which logs, lumber, lath, equipage, supplies, etc., so far as known to the Vendors, can be seen at the office of Beatty, Blackstock, Nesbitt, Chadwick & Riddell, 58 Wellington street east, Toronto, Ont.

The said timber limits, hereinbefore referred to, will be sold subject to the claim or lien (if any) of Merrill, Ring & Company, and Green, Ring & Company against same.

The entire property will be sold "en block."

The property will be sold subject to reserve bid.

Terms of payment: 25 per cent. cash on day of sale to the Vendors or their solicitors, the balance within thirty days thereafter with interest at the rate of 6 per cent. per annum.

Further terms and conditions will be made known on day of sale, or may be ascertained upon application to Beatty, Blackstock, Nesbitt, Chadwick & Riddell, Vendors' Solicitors, 58 Wellington street east, Toronto.

Dated at Toronto this 2nd day of November, A.D., 1900.

175 M. feet quartered 1 to 2 inch White and Red Oak
250 M. feet 1 to 4 inch Birch, also 4 to 8 inch squares.
Write for prices, etc.

LONDON LUMBER CO.,
London, Ont.

CURRENT TRADE CONDITIONS.

ONTARIO.

The transactions in lumber during the past week have borne out the prediction made in our last issue that there would be no great volume of trade during the closing weeks of the year. A goodly number of enquiries are being made, and some sales have been effected, but indications are not lacking that the trade is settling down to a winter basis. Large purchases for spring delivery are not likely to be made until January or February. The probability is that the spring demand will present itself earlier than is usual. There is an unconfirmed rumor that large contracts have been placed with the Ottawa valley mills for their next season's production of British deals. Pine mill culls are showing strength, and we would not be surprised if considerably higher prices for these would rule next season. Pine lath also give evidence of selling at higher figures. There is a scarcity of the better grades of basswood lumber. Other lines of hardwoods remain unchanged, with the demand showing a slight improvement.

A factor in the white pine market which should not be disregarded is the almost certainty of a decreased production of logs this winter. In view of the high cost of labor and supplies, logging operations in nearly every district are on a limited scale. There is much difficulty in obtaining the necessary number of woodsmen, and should weather conditions throughout the winter prove unfavorable, the production of logs may be even less than operators are reckoning upon. The prospects, therefore, are that less lumber will be manufactured next year than in the season now closing.

QUEBEC AND NEW BRUNSWICK.

Shipping from the St. Lawrence being practically over for the season, the spruce lumber market is consequently quiet. Shippers on this side are waiting events in Great Britain before contracting with manufacturers for next season's cut, and it must be said that the outlook for British trade is none too promising. The United States market has shown more life and shipments have increased. Spruce clap-boards are selling, on Boston rate of freight, at $29 to $30 for extra, and $27 to $28 for clear, while the corresponding figures for pine are $36 to $38 and $33 to $37. Extra cedar shingles are stronger at $2.75 to $2,90, clears bringing $2.40 to $3.50.

MANITOBA AND BRITISH COLUMBIA.

Throughout Manitoba and the Territories the movement of lumber is light. The retail dealers have sufficient stocks to carry them through the winter, and will not purchase for spring delivery until after the turn of the year. In British Columbia the local consumption of lumber continues to be of large value, and the shingle market is particularly firm. Vessels are now loading lumber at Chemainus for South Africa, and an increased export trade may be expected as a result.

UNITED STATES.

The lumber market of the United States has gained strength during the past week, with indications of slight weakness in respect to one or two classes of stock. The favorable features are a heavy movement of stock to the east, an increased number of enquiries for spring delivery, and higher prices for certain grades. The Boston market has developed unexpected strength, dealers there reporting a marked increase in demand. Buffalo dealers also tell of an improvement in demand, with a light supply of all grades above barn boards. Low grade inch seems to be slightly weaker and in larger supply, although at Tonawanda there is said to be a scarcity of 1x12 inch, the price of which has been advanced by one dollar per thousand. The manufacturers of spruce are advancing prices. At Bangor, Maine, narrow spruce is quoted at $16 to $17, wide at $17.50 to $20, scantlings at $15 to $16, and spruce boards, 10 to 16 feet long, at $13 to $14. Basswood leads the hardwoods in point of demand. A large eastern consuming firm is said to have made heavy purchases of 1¼ inch basswood in the Chicago market. Black ash is scarce, while maple is quite plentiful, with inch firsts and seconds selling the in Buffalo market at $22.

Lath prices have been advanced 25 cents per thousand in Cleveland, Bangor, and several other markets. At Ashland, Wis., No 1 white pine lath is held at $2.50.

GREAT BRITAIN.

The reports from Great Britain tell of an unsatisfactory condition of the timber market. London seems to be the centre

of the weakness, as stocks there are larger accordingly than at the other ports. A decided tendency towards lower prices has exhibited itself during the past fortnight. This is clearly shown by the result of the auction sale held by Churchill & Sim on the 14th inst., when nearly all classes of deals sold from ten shillings to one pound per standard lower than at the previous sale. St. John spruce deals sold 20 shillings lower, and battens 10 shillings lower, but it is said that this can be partly accounted for by the quality of the lumber. In contrast to other lines planed boards and flooring are showing strength.

We are yet unable to report any purchases of next season's goods. The market is in such a position that shippers are holding back their quotations in the hope that the consumption and demand may pick up, and that they may be able to effect sales at higher prices by waiting a few weeks. In our opinion the conditions are not favorable to high prices for early spring shipments.

STOCKS AND RICES.

Thos. Wilcox, of Parry Sound, Ont., has transferred his logging contract at Henvey Inlet for Burton Bros. to John Kennedy, of Barrie.

A report comes from Great Britain that large contracts for deals have been closed with importers in Spain at prices in advance of thoee paid last season.

The Skillings, Whitney & Barnes Lumber Company, of Boston, Mass., are reported to have purchased the entire cut of mill run lumber sawn by the Conger Lumber Company, of Parry Sound, during the past season.

The Hawkesbury Lumber Company, of Hawkesbury, Ont., had about 40,000 logs hung up this season in the Black river. They are now building a canal from a small lake into Black lake to permit of bringing the logs down.

The Dominion government invites tenders up to noon of December 1st for supply of timber and lumber required for the Quebec canals during 1901. Information may be obtained from Ernest Marceau, superintending engineer, 1709 Notre Dame street, Montreal.

The steamship Forest Holme sailed from Quebec last week for London, with a cargo of timber and deals. The steamer Norden sailed from St. John, N. B., for Velencia and Barcelona, with a cargo of lumber, shipped by A. Cushing & Co.

F. E. Neale, of Chatham, N. B., has made his last shipment of lumber for the season. The total quantity shipped was 33,000,000 feet, of which 22,000,000 feet was shipped from Miramichi and 11,000,000 feet from Campbellton. Mr. Neale is the largest shipper of spruce deals on the north shore of New Brunswick.

Six timber berths were sold by the New Brunswick Government last week at high prices, as follows: Rockwell Stream, three miles, to Alex. Burnette, at $4 per mile. North Branch Shikitobank river, two miles to C. E. Gallagher, at $8 per mile; West Branch of South Branch of the Nepisiguit river, 57.9 miles, to W. T. Whitehead, at $101 per mile; West Branch of South Branch of Nepisiguit river, 57.9 miles, to W. T. Whitehead, at $101 per mile; Big Tracadie river, at mouth of Lord and Foy's brook, six miles, to Sumner & Co., at $52 per mile; Big Tracadie river, at mouth of Little South Branch, six miles, to Sumner & Co., at $51 per mile.

The McCaskill steam saw mill at Little Narrows, N. S., was destroyed by fires last week. The loss is $2,000, and no insurance.

A saw mill at Marysville, N. B., owned by Alex. Gibson & Sons, was destroyed by fire on November 26th. The mill contained gang and rotary saws, and cut about 35,000 feet of lumber per day.

The schooner Annie A. Booth has just been chartered to carry laths from St. John, N. B., to New York at 70 cents per thousand.

The Keewatin Lumber and Manufacturing Company have taken over the planing mill of J. M. Taylor and the lumber business of Wm. Armstrong & Company at Portage la Prairie, Manitoba.

THE NEWS.

—The McLaren Estate are remodelling their mill at Buckingham, Que.

—A new saw mill has been completed at Templeton, Que., by J. Greene.

—Richard Smith is building a sash and door factory at Campbellton, N. B.

—McPherson Bros., saw millers, Boundary Falls, B. C., have resumed business.

—A new saw mill has been established by Oliver Bros. at Battleford, N. W. T.

—The Eastman Lumber Company are repairing their saw mill at Racine, Que.

—Alfred Dickie, of Stewiacke, N. S., is building a large steam saw mill at Liscombe Mills.

—J. N. McLean & Company have built a large addition to their planing mill at Windsor, Ont.

—Charles Pedwell expects to commence the erection of a saw mill at Lion's Head, Ont., early in the spring.

—Sutherland, Innes & Company, of Chatham, Ont., are establishing a stave and heading mill at Castleford.

—A saw mill, pulp mill and stave factory are among the new additions expected by the citizens of Beaver Mills, Ont.

—Dickie & McGrath, of Tusket, N. S., are desirous of engaging a number of portable mills to saw hardwood timber.

—The Chippewa Lumber Company, of Southampton, Ont., are extending their planing mill and sash and door factory.

—William Millions, of Carleton Place, Ont., has gone to Newfoundland to superintend the erection of a large saw mill there.

Alex. Patterson, of Millstream, N. B., has purchased a timber tract near Grand Falls, which he will log during the coming winter.

—Williamson & Crombie, of Kingsbury, Que., expect to operate their saw mill throughout the winter, having arranged for a supply of logs.

—J. A. Patterson, of Apohaqui, N. B., has purchased the saw mill of the Stevens Lumber Company at Salmon River, N. B., the consideration being about $15,000.

—The Hastings Shingle Manufacturing Company, of Vancouver, B. C., are operating their shingle mill night and day. They have installed a new lath machine.

—Men for the lumber woods in the Lake of the Woods district are scarce. The Rat Portage Lumber Company are advertising for teamsters, road-makers, axemen, etc.

—An English firm have sent a representative to Canada to locate a site for a furniture factory. It is reported that the factory will be located at Arnprior, Ont.

—The Rat Portage Lumber Company are opening a lumber yard at Portage la Prairie, Man. It will be under the management of A. Stevens, formerly of Cyprus River.

—Price Bros., of Quebec, are building a large saw mill at St. Catharines Cove, near Tadoussac, Que., which is expected to be in operation next spring. Mr. Charlton will be the manager.

—The saw factory of William Chaplin, at St. Catharines, Ont., was completely destroyed by fire early in November. Mr. Chaplin's loss is estimated at $75,000, and is only partially covered by insurance.

—Mr. Button, of Wingham, purposes building a factory at Manitowaning, Ont., for the manufacture of broom handles and other wood specialties for foreign markets. He may also go into the manufacture of furniture.

F. L. VanDusen, of Ottawa, an employee of the E. B. Eddy Company, has invented and patented a new match machine, said to be capable of making from blocks of wood 1,000 gross of four kinds of matches in ten hours.

—Extensive lumber yards have been established in Ottawa by W. H. McAuliffe. They are situated on Britannia street, have a piling capacity of over 1,000,000 feet, and are equipped with drying and storing facilities.

—Five attempts have been made recently to effect the destruction, by fire, of Messrs. Schurman, Lefurgy & Co's property in Sydney, C.B. The large new warehouse, which contains their offices and large quantities of dressed and manufactured lumber, narrowly escaped. No reason for the action has yet been found.

—Clifford Patterson, and other lumber operators, of Cumberland County, N. S., intend building a large steam mill in the Chilliwacs Valley, British Columbia. The machinery is being built by the Robb Engineering Company.

—It is said that the owners of the McLaren mills at Barnet, B. C., have under consideration the building of several lumber schooners at their mill this winter. This step has been suggested by the excessive freight rates ruling this year.

—An order in council has been passed permitting the Pigeon River Lumber Company, incorporated under the laws of the state of Wisconsin, to carry on the business of manufacturing lumber in Ontario. Herman Finger, of Fort William, Ont., is attorney for the company.

—The Rat Portage Lumber Company have opened a new retail lumber yard in Winnipeg. It is located on Point Douglas, close to the site of their proposed saw mill, and is in charge of J. M. Chrisholm, who for some years has been manager of the retail lumber business of Dick, Banning & Company.

—It is probable that a large saw mill will be built next spring on the site of the old Conroy mill at Deschenes, Que. The gentlemen interested are Messrs. J. B. Fraser and John Bryson, of Ottawa. The site for the mill is an excellent one, there being large piling grounds and good facilities for the shipping of lumber and the handling of logs in the river.

—Davidson & Thackray have entered into the first contract with the Pontiac & Pacific Junction Railway, the Ottawa and Gatineau Valley Railway, and the Interprovincial Bridge Company to carry lumber across the new bridge between Ottawa and Hull. The contract calls from 400 to 600 car loads a year. The lumber will be brought from Quyon and Fort Coulonge to the firm's planing mill in Ottawa.

—What is said to be the largest perfect plank ever turned out by a saw mill was manufactured by a California redwood mill not long ago. The plank is 2 inches thick, 6 feet wide and 17 feet long. It was cut by a band saw, and is perfect and without a flaw. Much larger pieces of redwood in the form of planks have been produced, but they were not perfect specimens.

—Rumors have been current for some time that the Pacific coast lumber manufacturers had organized under the name of the Associated Lumber Manufacturers of the Pacific coast. The proposed organization, it is said, is to be divided into two branches, an export branch and domestic branch. The territory to be covered includes British Columbia, Oregon, Washington and California.

—The mill of the Longford Lumber Company at Gravenhurst, Ont., was closed on October 31st, the company, as usual, giving the employees a dance and supper. The employees took advantage of the occasion to present their foreman, Mr. F. L. McNab, with a handsome gold watch and chain, together with an illuminated address expressive of the good feeling which has existed between the foreman and the employees during the past three years.

—The Chemainus Lumber & Manufacturing Company, of Victoria, B. C., have given out the following list of vessels under charter by the company to hold lumber: A 380 ton American schooner, now in port; Hawaiian barque Fort George, to load for Sydney, left Honolulu for Chemainus on October 20th; the Great Admiral, to load for Sydney; the Antofagasta, now en route to load at Chemainus; the St. James, now loading; the Roland, now on the way from Newcastle to Chemainus; and a German vessel and another British ship.

—Great improvements have been made to the mill of the North Pacific Lumber Company at Barnet, B. C., which is now under the management of J. M. Poitras. The circular saw has been replaced by one 10-foot band mill and one 8-foot band mill for resawing. There are four Berlin machines and one timber planer 24x30 ft., built especially for this mill. The smoke stack is of immense size; the lower 40 ft. has a water jacket in which the refuse of the mill is burned. The capacity of the dry kiln is 250,000 feet of lumber. The shipping facilities are excellent, an ocean wharf 500x500 feet permitting of vessels loading from three sides. A loading shed on the railroad track is 66x100 feet.

—An important deal was recently completed at Vancouver by which the Buse mill at Hastings was purchased by the William Tytler Lumber Company. The Buse mill was owned by some Minneapolis parties, J. J. Banfield being their local representative. The mill itself is of small capacity, but the site is an excellent one, with deep water wharfage for ocean vessels at low tide. It is stated that English capitalists are interested in the purchase, and that it is the intention to erect an export mill of large capacity.

—From Kingston, N. B., the manager of the Merchants' Bank of Halifax sends some interesting particulars about matters on the Northumberland Strait: "Trade here, which is principally in lumber, has been very good this year. All the mills on the Richibucto and Buctouche rivers have been very busy during the summer, and prices have been high. Shipments of deals to England have been larger than usual, and the "boom" in Cape Breton has increased our coastal trade." To a similar effect writes the manager of the Union Bank of Halifax at Annapolis, N. S.: "In reply to your enquiry I would say that our lumber exports have been more active than for many years past, and business generally has been fairly good in this section."

—The new saw mill of Edmund Hall at Sarnia, Ont., is nearly completed, although work on the tramways and docks will probably not be commenced until next spring. The mill is located about 1,000 feet from the shore of Sarnia bay. It is the present intention to make an island of the space immediately surrounding the mill, with a causeway and tram connecting it with the Grand Trunk railway, the main line of which runs parallel with the bay shore line. The equipment of the mill consists of two band saws, one gang saw, lath mill, and shingle mill. Power will be furnished by seven 16-foot boilers, supplying two engines of approximately 500 h.p. each, and smaller engines as occasion demands. There will be a private lighting system and an independent system of fire protection.

CASUALTIES.

—While working in Nichols & Kennedy's sash and door factory at Omemee, John Watson had the thumb sawn off his right hand.

—Patrick Flannigan, a logger, was instantly killed in Forbe's logging camp, near Vancouver, B.C., by a branch of a tree falling upon him.

—George Milton, who operated an edger at Drader's mill at Chatham, Ont., was almost instantly killed by being struck by a board thrown from the saw.

WOOD PULP DEPARTMENT

THE SAULT STE. MARIE PULP MILLS.

In a previous issue we outlined the steps which led to the establishment of the great pulp mills of the Sault Ste. Marie Pulp and Paper Company at Sault Ste. Marie, Ont. In this number we present illustrations of the mills, and give some particulars of the extensive industries which have been established.

Two of the mills, shown in the first illustration, manufacture mechanical pulp. Their cost of construction was in the neighborhood of $2,000,000, and they give employment to 500 men, while 400 others are engaged in the forest getting out spruce logs. The mills are operated day and night and the value of the annual production is about $1,000,000. No. 1 mill is 600 feet long and 80 feet wide, and No. 2 800 x 100 feet. It is estimated that the power required to run the mills is 14,000 horse power. The company have established a reserve supply of raw material and of the finished product, in order to meet the possible contingency of an accident entailing a delay in operation. This consists of about 30,000 cords of spruce logs and about 1,000 tons of wood pulp.

These mills being completed, the manufacture of sulphite pulp next engaged the attention of the manager, Mr. F. H. Clergue. The great drawback to the economical manufacture of sulphite pulp was the high price of sulphur, the chief source of supply being the Sicily mines. Mr. Clergue, however, set about to discover a means of getting a supply of sulphur. He went to Sudbury and noticed that sulphuric acid gas to the value of $2,000 a day was being allowed to escape during the process of roasting nickel ore, large quantities of which exist in the Sudbury district.

The outcome was that Mr. Clergue discovered a method to get sulphurous acid gas out of the pyrrhotite, and the erection of a sulphite mill was immediately decided upon, and is now nearing completion. It is 176 feet long, 68 feet wide, and 110 feet high. At the southern end there is an annex for the acid department 46 by 42 feet, surmounted by a stately tower. The height of this tower from the ground is 130 feet. The sulphite mill has been built of structural steel and native stone. It will turn out sufficient chemical pulp to treat the product of the two wood pulp mills, and in addition will produce daily 75 tons of clear, bleached sulphite fibre. The latter brings $75 a ton, and the annual output represents a value of over $2,000,000. The same number of hands will be given employment as in the ground wood pulp mills, viz., 500.

Two huge digesters, 54 feet in height by 17 feet in diameter, and built of 1 1-4 inch steel, are being placed in the sulphite building. The foundations of masonry under each will be capable of sustaining 750 tons, and will rest on solid rock.

The question of a supply of sulphur having been disposed of, Mr. Clergue turned his attention to other discoveries. It was found that the residue left after the sulphur had been removed from the ore contained nickel and iron in a perfect state of harmony, and when fused into a metal it produced an alloy of nickel steel. This discovery resulted in the construction of reduction works and a ferro-nickel plant. The works consist of a building 104x54 feet, containing an ore crushing plant with a capacity of 500 tons per day, and a second building 158x88 feet containing the roasters.

PULP MILLS NOS. 1 AND 2.

To remove the copper from the nickeliferous pyrrhotite, alkali works were established. They are equipped with 120 electrical machines for treating salt by the Rhodin process. Sodium is used for separating the copper from the nickel, but there is the chlorine still to be considered. This is converted by the aid of chlorine gas and lime into bleaching powder, a substance used for bleaching woollens, cloths and fabrics. The chlorine gas, instead of being allowed to escape, is forced by a glass pump into limewater, which is then used for bleaching the sulphite pulp.

So large a quantity of nickel ore is required to feed the reduction works that the sulphite mill is uuable to utilize it all, and a surplus of sulphurous fumes was, therefore, undisposed of. To allow this to escape meant a great loss, and so a means was devised of converting the gas into liquid sulphuric acid, which is in great demand for the purposes of ore refining, and for use in the arts. It is proposed to manufacture the acid and deliver it in tanks to the trade for use in making sulphite pulp at 50 per cent. less than sulphur can be obtained for from Sicily.

The nickel ore or pyrrhotite having been freed from sulphur, will be delivered to 100 electrical furnaces of five tons a day, where it will be turned out in the form of ferro-nickel pig. The intention is then to refine it into nickel steel. There are a splendid foundry, machine shop, pattern shop, carpenter shop and laboratory. These are equipped with plant and appliances of the most modern character. The foundry building is 160 feet in length by 100 feet in width, but a new foundry building 200x75 feet is in course of erection. The machine shop is 160x80 feet, operated by electric power.

Extensive works are still contemplated. At Moore's Point, three miles west of the present group of industries, will be located huge blast furnaces and works for the manufacture of Bessemer steel. In these works over 5,000 operators will be given constant employment.

SPECIAL NOTICE

We have inaugurated a **STOCK REDUCING SALE** for October, November and December, and will quote reduced prices on all inquiries received for shipment during time named.

We have a complete stock in all kinds, grades and dimensions, one to two years old, Bone Dry Hardwood Lumber, Yellow Pine and Cypress, kiln dried Maple Flooring, plain and quartered White and Red Oak Flooring, Surfaced Lumber, Wagon and Dimension Stock, and can ship straight or mixed car lots, quick delivery.

We have numerous stocks, last year's cut, piled in connection with saw mills in the country that we propose to close out and will quote you on a basis of lumber made, dried and delivered from the stump to your factory (no yarding expense). Besides we are offering special prices on Quarter Sawed Forked Leaf strictly White Oak, all one kind and color, well manufactured, band sawed, principally large figure, good widths and bone dry, including Quarter Sawed Red Oak, uniform color, quality and grade.

Inquiries solicited.

GEO. T. HOUSTON & CO.

Main Office: CHICAGO, ILL.
Cor. 22nd St. and Center Ave.

PULP NOTES.

American capitalists are said to be considering the establishment of a pulp mill at Buckingham, Que.

Hanna & Hutcheson Bros., of Huntsville, Ont., want to purchase 5,000 cords of spruce and hemlock pulp wood.

The Royal Paper Mills Company, of East Angus, Que., is building a dam and intends erecting another pulp mill at an early date.

The steamer Norden has been chartered by the Cushing Sulphite Fibre Company to take a cargo of pulp from St. John, N. B., to Great Britain.

The Chicoutimi Pulp Company, of Chicoutimi, Que., purpose increasing their plant. The present capacity is 100 tons of pulp a day. This will be increased to 300 tons. It is said that the company will produce 150 tons daily of dry pulp for the French market, for which purpose special machinery will be installed.

A scheme is said to be under way, in which Glasgow parties are interested, to remodel and put into operation the pulp mill built some years ago at Alberni, B. C. The capital of the proposed company is fixed at £100,000. An English capitalist residing in Victoria, B. C., is interesting himself in the undertaking.

The Lake St. John district, in the province of Quebec, is attracting considerable attention from pulp mill projectors. Mr. Worden, representing a large firm from Christiana, and Messrs. Ghysrul and VonBruysel, representing a Belgian syndicate, have been looking over the limits and water powers with a view to the establishment of pulp and paper mills.

The Dominion Industrial Company is applying for a Dominion charter, to manufacture pulp wood, pulp and paper, and to acquire the business of the Cookshire Mill Company, at Cookshire, Que. The capital is to be $200,000 and the head office at Sherbrooke. R. H. Pope, M. P., of Cookshire, and F. P. Buck, of Sherbrooke, are directors of the company.

Messrs. Edmund de Vialder & Herman Cortuet, of Brussels, are shareholders in the Belgo-Canadian Pulp and Paper Corporation, which intends building pulp and paper mills at Shawinigan Falls, on the St. Maurice river, Que. Mr. J. N. Greenshields, Q. C., of Montreal, recently visited Belgium and France in connection with the enterprise. He states that over one million dollars is to be put into the undertaking by the Belgian capitalists. It is expected that the output will be marketed largely in Belgium.

Another efficient substitute for pulp wood in paper making has been discovered in the southern saw palmetto, which hitherto has been considered merely a troublesome undergrowth to remove in clearing land. A paper plant has now been established at Pensacola, Fla., relying entirely upon this material for its supply and very successfully. The palmetto is very hardy and can be cut to the ground each year with the assurance that it will be just as abundant the following season. It remains to be seen whether as a valuable product of the soil it will retain the thriftiness which is supposed to belong merely to useless plants.

THE JENCKES MACHINE CO.
36-40 Lansdowne Street - SHERBROOKE, QUE

TRADE NOTES.

We are advised by Mr. Feeny, manager of the Ottawa Saw Works Company, that the company's new works will be put in operation in about a fortnight.

The Truro Foundry & Machine Company, of Truro, N.S., recently shipped a steam rotary mill, with trimmer and haul-up, to Rutledge & Sample, Salmon River, N.S.

The Jenckes Machine Company, of Sherbrooke, Que., have found it necessary to increase their accommodation. When the addittion now under way is completed their foundry will be 200x80 feet.

We have received from Messrs. J. E. Rhoads & Sons, of Philadelphia, a handsomely printed and illustrated catalogue of one hundred pages, descriptive of their leather belting and factory fire extinguishing appliances, etc.

Messrs. W. B. Mershon & Co., Saginaw, Michigan, make an annoucement in the advertisement pages of this number regarding their celebrated band resaws. They report trade to be satisfactory, one of their most recent sales in Canada being one of their style F band log mills to Messrs. Firstbrook Bros., of Toronto.

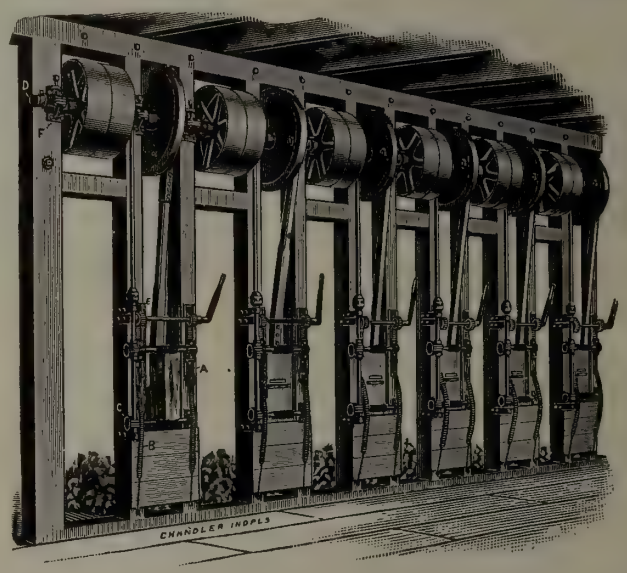
About fifty men will be employed in the new factory erected by Mr. J. W. Woods, the well known manufacturer of lumbermen's supplies, Queen street, Ottawa. The building is about completed, and operations will be started on a full scale by December 1st. An electric motor is being installed to operate the sewing, cutting, binding and button hole machines. The new structure, one of the most imposing in Ottawa, is a four storey one, thoroughly fireproof. The basement has been arranged for the safe storage of goods. Mr. Woods intends making a considerable increase in his manufacturing department.

Messrs. Campbell Bros., of St. John, N.B., advise us that during the past year they have done an exceptionally large trade in axes. They have received some encouraging testimonials on their last season's goods, and report that lumbermen are asking for their axes to a greater extent than ever before. Their hand made single and double bitted axes seem to be great favorites with the choppers, who appreciate a good axe better than anything else. Messrs. Campbell Bros. are now operating their factory to its full capacity, with an increased number of employees, and expect that their output of axes this season will be 50 per cent. greater than last year.

Elsewhere in this issue will be found the advertisement of the Blyth Handle & Turning Works, situated at Blyth, Ont., of which Mr. E. Livingstone is proprietor. Blyth is situated on the G.T.R., but shipment on the C.P.R. can be made from Wingham, or by boat from Goderich. Fire destroyed Mr. Livingstone's plant a few years ago. Since that time he has built his present factory and thoroughly equipped it with the most modern machinery necessary for the manufacture of all kinds and sizes of tool handles. Being situated in a district where second growth elm, suitable for handles, is to be had, he made a practical test of its adaptability for this purpose. It proved perfectly satisfactory, making the best handle in the market. Mr. Livingstone expects to do a large export trade, while paying particular attention to lumbermen's supplies.

A most enjoyable evening was spent by the members of the James Warnock Co. and their employees of Galt, on the occasion of their second annual dinner held on Nov. 9th, at the Imperial Hotel. Mr. John St. Clair, foreman of the tool shop, presided, the vice-chair being occupied by Mr. Geo. Fairgrieve, superintendent of the works. The chairman referred to the fact that they had three generations working in the shops, a condition that probably did not exist in any other factory in town. Mr. F.H. Hayhurst, the efficient business manager, replied to the toast "Ourselves," referring to the history and growth of the business since first established in 1844. Mr. Charles Stewart replied on behalf of "Our Manufacturing Industries." Mr. Geo. Fairgrieve did justice to "The Land of the Maple." An excellent orchestra and some well rendered songs added much to the enjoyment of the occasion.

The Best Excelsior Machine in the World



When two or more knives are run with one belt, all must stop when the belt is stopped to set bits or from any other cause. Our Machine has a belt for each knife, hence but one knife stops at a time. This great advantage should not be overlooked by purchasers. Time is money. Our Machine cuts more excelsior in a given time than any other machine. Get our circulars and prices.

CONGRATULATIONS.

Mr. O'Hara, inspector of Crown Lands, Agnes Beauce, Que., when renewing his subscription to the CANADA LUMBERMAN, writes: Allow me to congratulate you on some of the "practical" articles that have appeared in the LUMBERMAN during the past twelve months."

A DOUBLE-CUTTING SAW.

Mr. J. F. McRae and Mr. Charles Hamilton, foreman and filer respectively for the Rat Portage Lumber Company, of Rat Portage, Ont., have for some time been experimenting on a double-toothed saw, running on an old type of a Prescott band mill. As a result, they have satisfied themselves that they can operate the saw on this mill to advantage, and effect a considerable saving. We understand that they intend installing the saws for next season's cut. McRae claims that on account of having a top guide on the mill, it is an advantage over the telescopic mill, inasmuch as sawyers will not keep the mill down to the cut.

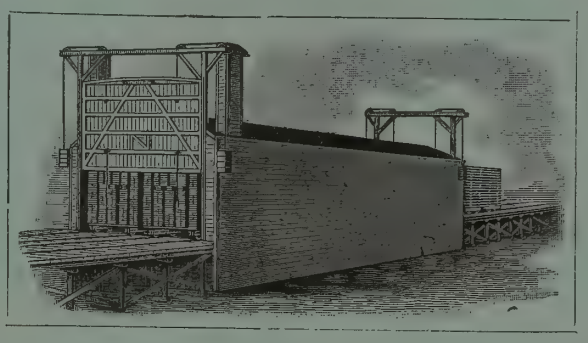
THE DRY KILN THAT DOES NOT Disappoint



THE DRY KILN THAT DOES NOT Disappoint

THE DRY KILN THAT DOES NOT Disappoint

THE DRY KILN THAT DOES NOT Disappoint

The Standard Seemed the Most Common Sense Dryer, and We Made No Mistake in Our Choice.

BRANTFORD, Ont., April 4, 1900.

THE STANDARD DRY KILN CO., Indianapolis, Ind.

GENTLEMEN:—Having had for the last twenty years considerable experience with Dry Kilns—Hot Blast and others—without getting the desired results, last spring there being no dry lumber to be had, especially in hardwoods, this compelled us to take up the question of more drying capacity. After very careful consideration The Standard seemed the most common sense dryer in the market, and we are more than pleased to say that we made no mistake in the choice. We have had the best of satisfaction from exhaust steam only, not requiring to use any live steam. If we were adding another kiln, we would certainly put in another of your make. It is a great saving on stock; it comes out in splendid shape. Yours truly,

THE SCHULTZ BROS. Co., Ltd.

R. H. SMITH CO., LIMITED

St. Catharines, Ont.

We are the Sole Manufacturers of Saws under the

Simonds' Process

in the Dominion of Canada.

There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. **All such Claims are FALSE,** as the patentee in the U. S. and ourselves are the only firms in the world who use it.

MILL STREAM, QUE., on I. C. R'y, December 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—Driving a 20 in. 13 gauge saw into frozen hardwood, using a 9 in. 4-ply belt, if it can be done satisfactorily, is a very severe test. Your saws have stood that test better than any I have tried. I have been experimenting with different makes—both home and imported—during the last five years, and give yours the preference. Last order is just to hand and will report on them by and bye.

Yours very truly, JAMES McKINLAY.

CAMPBELLTON, N.B., Nov. 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—In regard to your Shingle Saws, you can say that I have been using Shingle Saws of your make (Simonds) for the past four years, and they have given good satisfaction. I am running nine machines and use a good many saws, but have never had a saw yet that did not work satisfactorily. Before using your saws I used saws of American make, which worked well, but after giving your saw a trial have continued to use yours, as they are cheaper, and in regard to working qualities are all that is needed.

Yours truly, KILGOUR SHIVES.

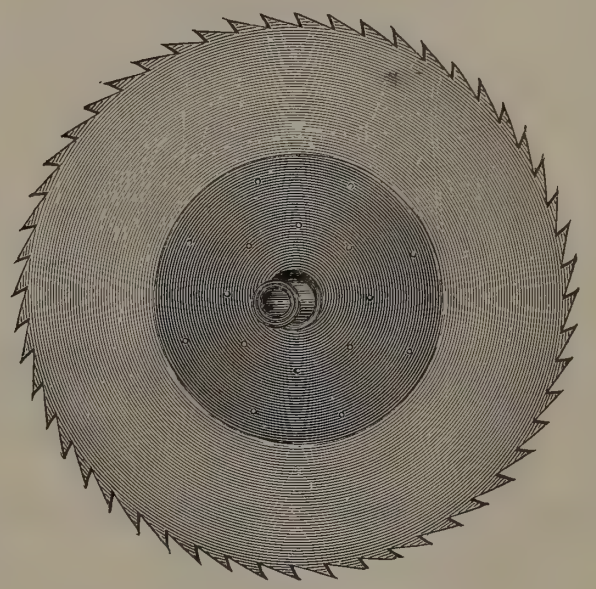
CLAVERING, ONT., May 3rd, 1897.

R. H. SMITH CO., LTD., St. Catharines, Ont.

GENTS,—In reply to your letter asking me how I liked the 62" SIMONDS Saw, I must say in all my experience I never had a saw stand up to its work like the one purchased from you last month. Having used saws for the last 22 years, and tried different makes, I can fully say it is the best saw I have ever had in my mill, and would recommend the SIMONDS' Process Saws to all mill men in need of circular saws.

Yours truly, W. G. SIMMIE.

P.S.—I am sending you my old saw to be repaired; please hammer to same speed as new one. W.G.S.



THE "LEADER" CROSS-CUT SAW

These Saws are made from the best DOUBLE REFINED SILVER STEEL, warranted four gauges thinner on back than front, and the only Saws on the market that are a perfect taper from the points of the teeth to the back, and require less Set than any other Cross-Cut Saw.

They are tempered by the Simonds' Patent Process, insuring a perfectly uniform temper throughout the plate, and stand without a rival as the BEST, FASTEST, AND EASIEST-CUTTING SAW KNOWN. A gauge to regulate the clearing teeth is furnished with each saw.

Directions for Setting and Filing are plainly Etched on every Saw. None genuine without our Registered Trade Mark as shown in cut.

THE "LEADER" SAW SWAGE

Made in 3 Sizes—$2.00, $2.50, $3.00 Net.

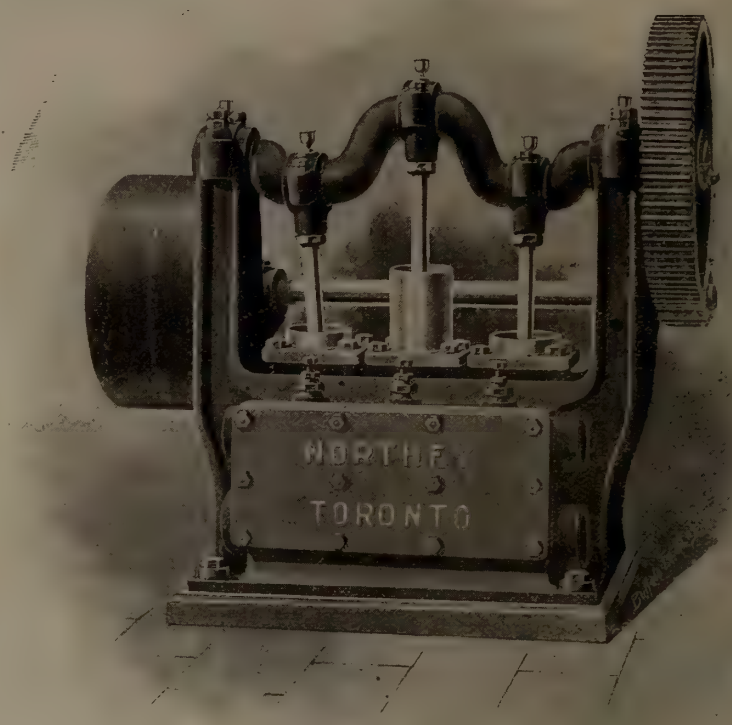
OUR PRICES ARE RIGHT. KINDLY ALLOW US TO QUOTE YOU BEFORE PURCHASING.

R. H. SMITH CO., Limited, St. Catharines, Ont.

Northey Triplex Power Pump

FOR BOILER FEEDING AND GENERAL PRESSURE PURPOSES

In the Northey Triplex Power Pump we offer a machine put together with the skill brought by years of experience in pump building, and with full provision made for the varied demands likely to be made upon a pump of this character. A feature of value is that the three cranks are placed 120 degrees apart, thus giving a practically constant flow of water—minimizing strain on pump and economizing power. The pump can be readily repacked and taken up, and all details are carefully worked out. It can be conveniently operated by electricity, by water power, or by belt from engine. Different styles and sizes made to suit all duties.



WE ARE MANUFACTURERS OF OVER FIVE HUNDRED DIFFERENT STYLES AND VARIETIES OF STEAM AND POWER PUMPS FOR STATIONARY AND MARINE PURPOSES. WE INVITE ENQUIRIES FROM ENGINEERS, MINE SUPERINTENDENTS AND OTHERS FOR THEIR REQUIREMENTS IN OUR LINE. CATALOGUES AND SPECIFICATIONS FURNISHED UPON REQUEST.

We are also manufacturers of the Northey Gas and Gasoline Engine which has proved to be the handiest and most convenient power for small or intermittent power users in the market. Suitable for machine shops, pumping and electric light plants, etc. Write for illustrated descriptive booklet.

REPRESENTATIVE LUMBERMEN IN THE DOMINION PARLIAMENT.

MERITS OF DIFFERENT TYPES OF SAWS.

UNDER what conditions it is profitable to employ a certain type of saw—band, circular or gang—is a point on which opinion is greatly divided. We give below the views of a few practical lumbermen on the subject :

CHESLEY, ONT., Dec. 11th.—We have been using a circular saw and find it very satisfactory. We have been thinking of replacing same with band saw mill, but have not done so yet. In looking into the band saw mill, there certainly seems to be a great saving in cutting.

KRUG BROS. & CO.

CHARLEMAGNE, QUE., Dec. 12th.—We have in our mill here one set of twin circulars, one stock gang 54", and two Prescott band mills; the band mills we have been running five seasons, twin circulars and gang thirteen. We cut principally spruce for export, and find the band mills by far the best machines to saw with, as we can cut our logs to better advantage and save nearly half in the saw kerf. If we were to rebuild our mill now, would put in all band mills and use band resaws for cutting up all our small logs.

A. MACLAURIN,
Manager Charlemagne & LacOuareau Lumber Co.

WOLFVILLE, N.S., Dec. 20, 1900.—Circulars have an advantage in small holdings when it would not pay to build stationary mills, otherwise they destroy too much good lumber in making sawdust. The gang is too well known for an opinion to add any acceptable information, yet we consider it away behind the band—first, the great saving in sawdust, next, the ease in which you can handle rough large logs and change cut without changing saw from plank board or timber, also rapidity of cut, smoothness of cut, and advantage can be taken of every log on its own merits. We have operated a band saw four years only, gang twenty-five years, rotary same.

THE S. P. BENJAMIN CO., LTD.

BRACEBRIDGE, ONT., Dec. 22, 1900.--My views about the respective merits of the different kinds of saws are : 1st, I am using a double band saw, and find it gives perfect satisfaction ; it will cut from 10 to 15 M ft. in an hour more than a single band and will not make shaky lumber. If the saw is out of order or the carriage out of line, a double band will make thick and thin lumber, while a single band will snake. 2nd, in comparison with a gang saw, the gang will cut about 15 M feet per hour more than a double band, but on the other hand there is a loss of from ten to twelve dollars per M in grade. 3rd, in comparison with a circular, there is no loss in grade, but a circular loses one eighth in kerf. A double band saw requires two extra men to run it.

J. D. SHIER.

BRACEBRIDGE, Dec. 15, 1900.—As to the relative merits of the different lumber producing machines now in use, I cannot but give the palm to the band saw for economy, speed and grade. In band sawing, while you may get a greater uniformity in thickness, it must be apparent to any practical miller or lumberman that the best results are not reached by the gang, especially when we consider how close pine and other woods are taken to-day ; even the rejects of former logging operations are not neglected. Many of these logs seem useless at first sight, but by careful sawing they produce some of our best lumber. In gang sawing you have no opportunity to sort the best lumber from the log. The circular, while in many cases taking more saw kerf than the gang and slabber, made it possible to get better results and a higher priced lumber, and sawing became an art. A sawyer's reputation depends as much on his ability to cut for value and grade as for a large output. Circular lumber is scarcely as ridged or snaky as gang sawn, as the latter is more easily led by the grain or turned aside by a knot. But long ago it became apparent that the circular was wasting too much valuable timber, nearly ⅛ sawn in kerf alone with the heavy gauge and swage. This has been partly remedied by reducing the saw kerf, but the sawing of large logs, through which the saw would not reach, results in great loss, as the log must be canted until it is almost octagon shaped, causing great loss in edging ; nearly or quite 25 per cent. of the best timber is thus lost. The band saw, however, removes nearly all these difficulties. Few logs are so large that it will not saw up to square edge or cants. The great saving in this alone would soon repay any millman to make the change. Again, the saw kerf is only a trifle more than half that of the circular in general use, which alone represents a fair profit to the millman, as slabs and edgings are cheaper fuel than lumber (sawdust). I believe the band is here to stay, and for economy, speed and good work is unsurpassed as yet.

J. M. BIRD.

WOODSTOCK, ONT., Dec. 12th.—In this northern country we think the gang has no place because of the mixed class of timber ; it is more suitable for operating in timber such as southern pine or Pacific coast pine, where lumber as a rule is made into stock sizes and the quality is of uniform grade. The circular saw is most advantageous where the following conditions prevail—(1) Where the timber is small and the quality poor or of low value ; (2) in isolated or mountainous districts where the mill would require to be frequently moved to new locations ; (3) when the annual cut is less than, say, one million feet per annum.

The band mill is more suitable when the opposite conditions prevail, viz.: (1) Good quality of timber at high value ; (2) a comparatively permanent location ; (3) large annual cut.

From the foregoing data we conclude that the band mill is the most profitable mill where a moderate stock of high quality of logs is to be sawn or a large stock of a general quality, but for small operations the circular mill will always have the advantage in consequence of the small capital investment necessary to install and operate it.

O. G. ANDERSON.

RAT PORTAGE, ONT., Dec. 11.—Regarding the merits of band and circular saws for the manufacture of lumber, as far as my experience goes I can advance several good points for both. First, I will take up some advantages of the band saw. Where there is good timber to be sawn, by all means use a band saw. In logs running from eight to twelve to the thousand feet, there is a saving of ten per cent. over a circular saw ; some claim a greater saving, but I think that in all classes of logs this is an average estimate of what is generally saved. Other advantages possessed by a band saw over a circular are that when properly handled the lumber is so much better manufactured that you can slab much lighter and consequently make into lumber what is generally wasted in slabs with a circular, and with larger logs the band will saw faster and waste much less timber. I have learned since I came into contact with band mills, to take good care of the saws and see that they are properly hammered and teeth kept in proper shape. To accomplish good results from a band saw good filers should be employed, and the way to find out a good filer is to watch that his saws do not crack, that they do not shove back on the wheel when cutting in the log, that all the lumber is sawed straight and even, and, providing the mill is a modern one with latest and most improved machinery, that it saws 50,000 feet in ten hours. Sawyers and filers should command good wages, and it is a mistake to experiment by changing too frequently. The above remarks refer only to single band mills, but as I intend changing one of our band mills here into a double cutter this winter, I will be in a position later on to state more definitely what a double cutting band can do. Now, as to a circular saw. In small and rough timber a circular will do good work and more of it than a band. By using 10 gauge saws the sawdust will not amount to much. In small logs, in double mills where there is a gang, where one side is used for slabbing and logs can be separated on dock, a circular will do good work because it will take the slab off small and rough logs faster than a band saw will do. All good logs are sent to the band saw. One objection to circulars in past years has been the waste in sawdust ; saws were used from six to seven gauge. Now we find good work can be done by using nine to ten gauge, which is a great difference from the old style of circulars. By using two guide pins on a ten gauge circular you can saw faster in small timber than with a six gauge in the old way and do good work.

"OAK."

A new line of steamers will be established next spring between Liverpool and Manchester and a port on the Baie des Chaleurs. One of the chief purposes of the line will be to carry pulp.

CORRESPONDENCE

IMPORT DUTY WANTED.

BRACEBRIDGE, Dec. 18th, 1900.

Editor CANADA LUMBERMAN:

DEAR SIR,—Allow me through your valuable paper to call the attention of the Ontario lumbermen to the system of pine lumber export into Canada, and more particularly into Ontario. While our neighbors to the south of us will allow no lumber except basswood to go into their country from Canada unless we pay a duty of $2.00 per M, and $1.00 per M on basswood, they have free access to our market, sending in without duty many woods which compete directly with our native Canadian lumber. These are oak, southern pine, whitewood, balm, white pine, elm, ash, hemlock, and a number of other woods, all of which compete very strongly against the lumbermen of this province. Take for instance hemlock. Owing to cheap water transportation this lumber can be laid down in Buffalo or any other lake or river port cheaper than we can supply it. Hemlock is being freighted to lake and river points and sent inland throughout western and southern Ontario by American firms cheaper than we can supply our own people. Take, as an instance, a vessel carries a load to Sarnia or Windsor, they unload on cars which carry the lumber inland at from 60 cents to $1.00 per thousand, delivering the lumber to the buyer at about $12.00 per M or less, which is about $1.00 per M less than we can possibly deliver the same class of lumber to western or southern Ontario, and about $3.50 per M less than we can lay it down in Buffalo or similar points. It is even reported that the harbor improvements at Port Colborne are being supplied from American sources to the detriment and loss of Canadian producers. This is no small matter, and means a greater loss to Ontario lumbermen than may appear at first sight. Let us meet our neighbors fairly, and if they still bar the door by an import duty they should pay a like duty for the privilege which they enjoy in our markets. Trusting that you will place this matter more forceably than I have done before our lumbermen, I am,

Yours truly,

J. M. BIRD.

BRITISH COLUMBIA SHINGLES.

VANCOUVER, Dec. 21, 1900.

Editor CANADA LUMBERMAN:

SIR,—Some London, Ont., architects have recently been informing Col. Tracey, city engineer of this city, that British Columbia shingles are over dried, and that as a consequence the demand for them is decreasing in Ontario. I wish to most emphatically contradict these statements. British Columbia shingles are not over dried, and the demand for them in Ontario, instead of decreasing, has been constantly increasing since they were first introduced into Ontario. I have spoken to all the manufacturers on the coast who ship to Ontario, and have been informed that they have no complaints whatever about their shingles being damaged by over drying. In a personal experience of over twelve years in shipping B. C. shingles to Manitoba and Ontario, I cannot call to mind but one or two trivial complaints about this alleged damage to our shingles. I may also state that I have recently returned from an extensive tour of Ontario in the interests of our business, and called on all the prominent retail lumber merchants, without hearing a single complaint on this question.

Our shingles have now been in use in Ontario from eight to ten years, and in Manitoba and the North-West about fifteen years, and there are hundreds of buildings throughout these sections of the country which have been covered all these years with British Columbia shingles, and the shingles are lying perfectly flat on the roofs and are as sound and durable now as the day they were put on, and will continue to properly protect the buildings on which they are placed for the next twenty-five years.

While the statements to which I have called your attention are untrue, we as manufacturers have a good many difficulties to contend with, such as the free importation into our markets of United States shingles, the slaughtering of our prices, and the division of a trade which is far and away too small for our own mills.

The production of the shingle mills in British Columbia at the present time is about three times in excess of the demand, and as a consequence competition is very keen, and prices exceedingly low.

As an instance of the large over-production of shingles in British Columbia, one of the largest companies in the Province has closed down its mill, and has gone out of the business of manufacturing shingles ; and unless we get protection against U. S. shingles other mills will have to follow their example, or move to the American side where we can have better markets free.

H. H. SPICER.

QUEBEC MILL PROPERTIES.

THE illustrations on this page represent the saw mills of Messrs. Whitehead & Turner, of Quebec, who are about to retire from the lumber business, and are offering for sale their valuable limits, mills, etc. This is one of the most valuable lumbering properties in the province of Quebec. The situation is unique, having the Lake St. John railway running through the limits and the port of Quebec as a point of shipment, while the Great Northern railway and the Quebec bridge give additional facilities for the delivery of the mill product. The limits consist of about 280 miles, containing a large quantity of spruce, bouleau and birch. The mill at Lake Edward is equipped with circular saws, while that at Pearl Lake contains steam feed circular and gang. The property is being operated, and, we understand, will be disposed of at a moderate price. An advertisement offering the property for sale will be found in the weekly edition.

LAKE EDWARD SAW MILL OF WHITEHEAD & TURNER.

QUESTIONS AND ANSWERS.

"R. W. R.," Wales, writes :—Kindly state whether letters posted in Great Britain will reach the principal towns of Canada by addressing them via Halifax, N.S., earlier than if addressed via Quebec and Montreal.

ANS.—No. Letters from Great Britain to Canada are transmitted most speedily if addressed via New York.

"Mill Owner" writes : Where water power is not obtainable, and where coal can be bought for $1.80 a ton, could electricity be generated and electrically applied by motors to the extent of 500 h.p. as cheaply as by belting and shafts, where said power would be used within a radius of 100 feet of engine shaft.

ANS.—Broadly speaking, the original or capital outlay to cover the cost of the dynamos to convert the mechanical power of the engines into electrical power, the necessary wire to carry that power to the various motors, and the motors to convert it back to its original mechanical shape, will cost considerably more than the belting and shafting necessary for the same work, though in the absence of the detail of the proposed layout, it is impossible to give even approximate figures. The relative cost of operating the two systems will also depend entirely on the details of the particular installation in question, though it is likely to be somewhat in favor of the electric plant, the more so as the average load drops below the full load or rated output of the whole installation. The relative advantage of the two systems, outside of the question of cost, are in every way in favor of the electric, it having the superiority in (1) simplicity and freedom from noise and dirt in the transmitting device (the wires), (2) its great flexibility, (3) facility for future extensions, with but very little change and modifications in the already existing plant, (4) the ability to furnish light as well as power, with a maximum of convenience at a minimum of cost.

NEW SAW SHARPENER.

Mr. Alex. McCool, foreman in the Pembroke Lumber Company's mills at Pembroke, Ont., and who has had a long experience in the care of saws and saw mill machinery generally, has invented a saw sharpener. The machine is suitable for gumming or sharpening all kinds of circular saws by hand, and is especially adapted for trimmers or cut off saws. The saw is hung on a cone of which the centre is directly under the emery wheel. The gate swings at an angle of 60 degrees and is held in place by a thumb nut so as to make the bevel on the tooth perfect.

The machine is so constructed that it can be changed instantly from rip to crosscut grinding, and can be adjusted in a moment to take a saw of any size from 8 to 68 inches in diameter. The reversible cone will fit any size of saw mandrill hole from one to four inches in diameter. The machine is built entirely of iron and steel, is abundantly strong, rigid and handy. It is claimed that one man can do more and better work in one hour with this machine than could be done in five hours with a hand file.

Expert filers who have seen the machine working say it is the most perfect and simple saw sharpener they have ever seen. It is capable of gumming and sharpening any circular, rip or crosscut saw that can be done with an emery wheel. It requires no expert to operate the machine, it being so simple that any ordinary boy can handle it to perfection.

PEARL LAKE SAW MILL OF WHITEHEAD & TURNER.

CANADIAN COOPERAGE ASSOCIATION.

A meeting of cooperage stock manufacturers was held at Chatham, Ont., early in December last, to consider the question of organization. The following manufacturers were present : D. R. Menzies, of the Niebergall Stave & Lumber Co., Staples ; W. M. Drader, Chatham ; W. H. Mathews, Trenton ; A. A. Scott, McGregor ; J. B. Coates, Ridgetown ; M. DeCew, Fenelon Falls ; Geo. Hunt, Ruscomb ; J. W. Smith, of Smith Bros., Stewart ; J. L. Reaume, Essex ; and W. C. West and James Innes, of the Sutherland, Innes Co., Limited, Chatham.

Letters of regret were read from a number of manufacturers advising that the short notice prevented them from attending the meeting.

It was decided to form a Canadian branch of the Slack Barrel Manufacturers' Association. Mr. James Innes was elected president, A. A. Scott vice-president and J. B. Coates secretary-treasurer.

The purpose of the association is of a social and business character, to move to redress grievances under which the manufacturers are laboring, such as the exorbitant rates charged by the railroad companies, the poor service given by the railroads, the prevention of exportation of raw material to foreign countries, and general business connected with the manufacturers. The association is one that does not aim to control prices, the Slack Cooperage Association having it as part of their platform that the prices are not to be dealt with at meetings of the association.

REMOVING BOILER SCALE.

The following plan of removing scale from boilers is recommended as being fairly rapid and nearly always satisfactory : After drawing the fires wait till the firebridge is sufficiently cooled down, then blow down the boiler till it is empty. Some recommend a high pressure for this purpose, others a low pressure. When empty, allow the boiler to cool without opening any manhole doors or valves. When cool, the scale should shell off in large flakes. From boilers provided with low-water and high-pressure safety valves, the air cannot, of course, be excluded, as these valves open when the water falls, but even where these valves are fitted the method works fairly satisfactorily.

Canada Lumberman

MONTHLY AND WEEKLY EDITIONS

PUBLISHED BY

The C. H. Mortimer Publishing Company of Toronto, Limited

CONFEDERATION LIFE BUILDING, TORONTO

BRANCH OFFICE:
IMPERIAL BUILDING, MONTREAL

The LUMBERMAN Weekly Edition is published every Wednesday, and the Monthly Edition on the 1st day of every month.

TERMS OF SUBSCRIPTION:

One Copy, Weekly and Monthly, One Year, in advance..... $1.00
One Copy, Weekly and Monthly, Six Months, in advance..... .50
Foreign Subscriptions, $2.00 a Year.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in anyway affecting it. Even when we may not be able to agree with the writers, we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

A WORD IN SEASON.

WITH this number, issued upon the advent of a new century, this journal enters upon its twenty-second year of publication. It will not, we hope, be regarded as boastful to state that during its life the CANADA LUMBERMAN has endeavored, faithfully and consistently, to advance the interests of the important and growing industry which it represents. This statement is made almost without fear of challenge, as the steadily increasing patronage from subscribers and advertisers and frequent letters of commendation bear ample testimony to the fact.

Prompted, as in all business enterprises, by pecuniary motives, the aim of the publishers has been to impart useful and valuable information, and thus to produce a paper which would be carefully read by its subscribers. That this object has been accomplished is proven by the above mentioned evidence.

Representing exclusively the lumbering and wood-working industries of the Dominion, THE LUMBERMAN has become recognized as the only direct medium through which to reach these classes. In its advertising pages will be found the announcements of manufacturers of nearly every line of lumbering, planing mill, wood-working and pulp making machinery. It has also become a strong factor in the development of the export lumber trade of Canada, personal visits to Europe having been made by a representative for this purpose. It is the desire of the publishers to promote this branch of trade to the greatest possible extent, and to bring together Canadian manufacturers and foreign importers.

During the first year of the new century it is hoped to further improve the journal by giving a greater volume of information affecting the commercial as well as the practical side of lumbering. To this end we invite the assistance of our readers, and solicit each one to contribute something through our columns to the general fund of information. It is also asked that our readers keep us informed regarding proposed improvements to their saw mills, planing mills and other departments of their business.

To the trade generally we extend the Season's Greetings.

BUSINESS METHODS OF LUMBERMEN.

IF there is one thing which is conductive to the expansion of trade, it is the practice of honest business methods. The exchange of commodities is very largely based on mutual confidence, without which business could not be advantageously carried on. In no branch is this more a necessity than in the lumber trade. The ethics of Canadian lumbermen are, generally speaking, unimpeachable, and their word is regarded as a binding contract. Unfortunately, however, the exception to the rule is always to be found.

No one will deny a person the right of being the architect of his own fortune, but when his course of action affects others injuriously, the law of self-protection demands that it be restricted within proper limits.

In at least two directions unscrupulous persons in the lumber trade have been able to accomplish their ends. One of these is by refusing to recognize contracts arranged verbally when it has been found a pecuniary advantage to do otherwise. A dealer, for instance, agrees to purchase certain lumber from a manufacturer, to be shipped at a given date. In the meantime the market has improved, and the manufacturer finds that he is in a position to sell the same lumber at a higher price, and consequently refues to honor the contract. The buyer, in the absence of a written agreement, is unable to secure judgment against him, although he may have suffered a loss as the result of the non-fulfillment of the contract. It is not intended to imply that the manufacturer is the only transgressor in this direction, as the breach of faith might likewise apply to a dealer who would refuse to recognize a similar agreement in the event of the market having declined, placing him in a position to purchase the required lumber at a lower price. Instances of this kind have been known to occur, and it seems that the only remedy is to have written contracts in every case.

Another manner in which dishonesty is sometimes practiced is in what might be termed the stealing of customers. An instance of this is cited in a letter just received by the CANADA LUMBERMAN from a dealer in a western Ontario town. This dealer sold to a large consumer of lumber in his town a car load of short leaf yellow pine, which he purchased from a Michigan firm. He hoped to secure a considerable trade, but the Michigan firm set to work immediately to discover his customer, and while making the pretense of a social visit to the dealer, learned of the party who was using the lumber. The result was that quotations were given to the customer at the same figure as had been paid by the dealer, who was instrumental in introducing the lumber in the market. That this was an injustice to the dealer is apparent to all fair-minded people. Occasionally, also, millmen will take underhand methods of finding out the destination of lumber bought by dealers and shipped direct to customers from the mill.

It is evident that even the few who adopt dishonest tactics are not confined to any one branch of the lumber trade. But while there are some persons who, in business matters, seem to have no regard for moral obligations, it is equally true that Canadian lumbermen generally conduct their business affairs in a thoroughly honorable manner.

SHIP-BUILDING IN CANADA.

THE lumber shippers of this country suffered severely during the past year on account of the great scarcity of vessel tonnage. This scarcity was felt by all branches of the export trade, but particularly by lumbermen, as it is the policy of some vessel owners to accept lumber only when other freight is not available. This dearth of vessels was common both to the eastern and western seaboards. One of the reasons for this condition was that a large number of vessels were employed for the transport of troops to South Africa. Another reason, which applies to the Atlantic coast, was the scarcity of tramp steamers, which avoided Canadian ports on account of the largely increased rates of insurance for trading to British North America. These rates have been exorbitant and out of all proportion to the increased risk. How these conditions have affected the shipping trade of Canada is shown by a comparison with the previous year. In 1899 801 vessels entered the port of Montreal, whereas last year the number was 726, a decrease of 75 vessels. From this it must not be inferred that the export trade of Canada is declining, as the trade and navigation returns show the reverse condition. The conclusion is that the discrimination against Canadian ports has caused merchants to ship via United States ports.

British Columbia shippers of lumber found it almost impossible during the year to secure tonnage. The situation there is somewhat peculiar. Nearly all the vessels trading on the Pacific coast are owned or controlled by United States parties, who, in many instances, are interested in United States saw mills. The result has been that British Columbia ports have been boycotted, and that charters have been effected only when the circumstances were especially favorable to the shipowner. A discrimination of 60 cents per thousand feet on lumber loaded at British Columbia ports has ruled during the year.

The facts above outlined have brought prominently to the front the question of reviving the ship-building industry of Canada, which was no unimportant industry thirty or forty years ago. In those days wooden vessels were constructed, while the requirements of the present time call for steel crafts. It has been pointed out by a prominent ship-builder that there is more similarity between the construction of steel and wooden ships than is generally believed, and

t at the Maritime Provinces possess excellent facilities for the construction of the former. It is encouraging to learn that the movement has so far advanced that propositions have been made to the Governments for the establishments of a steel ship-building plant at St. John, and that the Dominion Iron & Steel Company, of Sydney, Nova Scotia, are considering a step in the same direction. Some British Columbia lumbermen have also made representations to the Provincial and Dominion Governments urging that the business of shipbuilding be encouraged by the granting of subsidies for the construction of sea-going vessels. The proposition has met with favor on all sides, and it is announced that both Governments will introduce legislation to this end during next session. Encouraged by the outlook, steps have already been taken for the formation of a company. It is proposed to build a number of wooden schooners of up-to-date model, each to be capable of carrying at least one million feet of lumber. Such a movement would undoubtedly be followed by other shipbuilding, and provided assistance is given by the Federal and Provincial Governments, it will prove a financial success, not to speak of the great boon it would prove to the lumber trade.

THE PULP AND PAPER INDUSTRY.

Looking back over the year 1900, we find that there was a considerable development of the pulp and paper industry in Canada. The output of Canadian mills now completed is greater than twelve months ago, while mills under construction will very soon further augment the supply. Prices for pulp ruled firm throughout the year. As a result of the existence of somewhat exceptional conditions in Scandinavia, the attention of foreign investors was attracted to the excellent possibilities that exist in Canada for the manufacture of pulp. Available properties were surveyed, and the erection of mills will no doubt follow in due course.

The manufacture of paper received a stimulus early in the year by the destruction by fire of the immense paper mills of the E. B. Eddy Company at Hull. The remaining mills were taxed to their utmost capacity to supply the demand, while large importations were made from the United States and Great Britain. The preference of 33⅓ per cent. in duty in favor of Great Britain has given the British paper makers a marked advantage in competing for the Canadian trade.

During the year it is believed that Canada imported paper of all kinds to the value of over $1,000,000, printing paper, or in other words, newspaper, representing no small portion of this import. While the volume of paper imports was no doubt increased by the fire above referred to, reference to trade statistics shows that Canada has always been an importer of paper. With such an abundant supply of raw material, it should not be necessary to import supplies of paper from other countries ; on the other hand, there is no reason why we should not develop a large export trade in pulp and paper. Some progress in this direction is being made, a new mill is being built to manufacture book paper principally. Heretofore our attention has been given chiefly to the manufacture of newspaper, but now that the better grades are to be produced, a decrease in our imports may be looked for.

The United States, although importing both pulp wood and pulp from Canada, is a large exporter of paper. It is estimated that during last year the exports of paper reached $6,000,000. In the month of November about $200,000 worth of paper was shipped to Australia, while orher shipments were made to Japan, South Africa, Germany, Spain, Great Britain, and other countries. This trade will eventually, we hope, be supplied by Canadian manufacturers, although a few years may elapse before the necessary facilities are provided to furnish the supply.

EDITORIAL NOTES.

A LATE enquiry received at the office of the CANADA LUMBERMAN is for box shooks for the German market. Eventually the lumber of Canada will find its way into every importing country in the world.

A SUBSCRIBER asks readers of THE LUMBERMAN to express their opinions as to the relative advantages for a planing mill, of overhead shafting and shafting under the mill, with belts running up through the floor, the same as in a saw mill. Information is also asked regarding plans for lumber storage sheds for a retail and wholesale yard with capacity of from three hundred to five hundred thousand feet. Suggestions from our readers on the above subjects will be welcomed.

A CARGO of British Columbia Douglas fir recently received at Cardiff, England, has attracted much attention. It is the first cargo of this class of timber imported into the Bristol Channel. The timber runs from 90 to 100 feet in length, and is 24 inches square. It is practically free from sap, knots or shakes, and is well suited for railway building and other work where strong material is required. It was inspected by inspectors for some of the leading railway companies in the country, and we understand that the importers have received large orders. The rish involved in making a shipment of timber from British Columbia to Europe will be understood when it is stated that the freight alone on this cargo was $35,000, and that the voyage from Vancouver to Bristol occupied between five and six months.

A CAUSE of some annoyance to shippers of lumber is the refusal of steamship companies in some instances to give a clean bill of lading. The steamship company practically refuses to assume any responsibility for the delivery of the proper quantity of goods or in respect to damage thereto. A shipper may deliver on the ship and pay freight on a certain quantity of lumber, and when it reaches its destination find that the quantity is lacking or that the goods have been damaged on account of being roughly handled and improperly taken care of. The steamship company refuses to recognize any claim in this behalf, contending that they are not concerned as to the number of pieces furnished, and that to their knowledge the goods have not been damaged. The shipper is unable, under these conditions, to obtain any redress, although there can be no doubt as to his right to be recompensed for the loss. Some steamship lines have adopted the policy of granting clean bills of lading, which is doubtless the proper course, and one which we hope will be followed in the near future by all companies.

IN a letter to be found in another column, Mr. J. M. Bird, of Bracebridge, again directs attention to the injustice of permitting United States timber to be imported into Canada free of duty, while Canadians are not accorded the freedom of the United States markets. The views of Mr. Bird are, we believe, those of every lumberman in Canada who is not an out-and-out free trader. And even this class, whether in favor of an import duty or otherwise, will admit that the situation is most unfair. It is of no concern what conditions permit of the timber being marketed here ; the question is one of equal rights. The import of United States timber is apparently on the increase. An immense quantity of Southern pine is being employed in the construction of the interprovincial bridge at Quebec. So with the Toronto harbor improvements, and, we understand, with the Port Colborne improvements about to be commenced. Given the free interchange of forest products between the two countries, there would be no ground for complaint, but it is manifestly unfair to throw open the Canadian market to United States lumbermen when, as stated above, a tariff is imposed by the United States upon the Canadian product. The Dominion Government has evidently no intention of placing a duty on United States lumber. The only hope seems to be for the lumbermen of Canada to band together, and by a strong and proper representation of the situation, arouse the Government to a sense of its duty. In certain sections of the Dominion the lumbermen are not directly affected by importations from the United States, but they should cast aside all selfishness and as a body endeavor to secure that protection for the industry to which it is entitled

THE LATE JAMES ROBERTSON.

IN the death of Mr. James Robertson, president of the James Robertson Company, Limited, which occurred in Montreal a fortnight ago, Canada loses one of her most prominent business men. For upwards of a year he had been in failing health, and was compelled to give up an active interest in the management of his extensive business. Deceased was born at Campsie, in Sterlingshire, Scotland, in 1831, and at the age of 12 years was apprenticed to the hardware trade. When 26 years old he became a partner with Alexander, Ferguson & Lonnie, of Glasgow, and established a Canadian branch for them in Montreal on the 25th of June, 1857. After having been in charge for about five years he bought out his principals and began business on his own account as a manufacturer of lead pipes and dealer in heavy metals and plumber's supplies generally. The business quickly expanded and included, among other things, the manufacture of circular and gang saws and other mill supplies, until to-day it is the largest business of the kind in Canada. The head office remains in Montreal, while branches exist in Toronto, Winnipeg, St. John, N.B., and Baltimore, Maryland.

SOME HINTS FOR MILL MEN.

MILL men are often called upon to get out stuff of various kind for which no provision has been made for working out with the machines at their command. With a band-saw, and the attachments illustrated herewith, a great variety of ornamental blocks may be produced, some of which are shown in the illustrations presented at Fig. 3. The attachment shown at Fig. 1, which is made of wood, and which

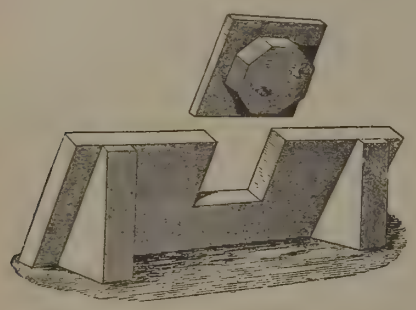

FIG. 1.—ATTACHMENT TO BAND SAWS, FOR SAWING ORNAMENTS.

any mechanic can make, has been used in some shops many years, and in some localities the ornaments produced by it have become quite popular for a variety of purposes. The attachment as shown at Fig. 1 may be made to cut at any angle, but if made to cut at 60 degrees it will be found as useful as any perhaps. By its use hundreds of designs can be produced, the variety being limited only by the taste and skill of the operator. The few examples shown at Fig. 3 give some idea of the character of the work that can be produced, and in case an ornament or a different number of sides from 4 to 8 is desirable, the gain shown and the block may be made to suit. The manner of operating is shown at Fig. 2, when the saw is forming the cross ornament. It is necessary the block should have as many sides as the desired ornament, and that the gain be made to fit the block. It is evident from the foregoing that many designs of center ornaments, rosettes, head-blocks, etc., that have been hitherto cut or carved by hand, may be readily and expeditiously sawn on either a scroll-saw or a band-saw. The size of the device is not material. It should, however, be proportioned to the size of the work to be done. For example, for a 3-inch rosette it would be well to make Fig. 1 about one foot long and four inches high. The gain in the inclined piece should be about 2¼ inches square and the block should fit neatly in the gain of the inclined

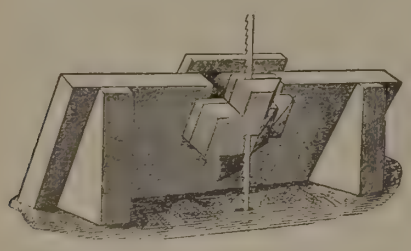

FIG. 2.—ATTACHMENT IN OPERATION.

piece. The gain and the block may be square or semi-circular. The following direction will indicate how the attachment is to be used: Cut the face figure of the ornament first, then fasten it to the block by means of wood screws as shown. Drop the block into the gain in the inclined piece, first laying off the edges as they are to be sawn. It will be noticed in the accompanying sketches of work that the edges are all simply gauged an equal distance from the back. This, however, can be varied sometimes with good effect. The skilful operator will evolve many designs of ornament not even suggested in this brief description when he becomes accustomed to the method of working the attachment.

CUTTING CIRCULAR RAIL WITH ATTACHMENT.

To make a hand-rail for a circular stairway has always been considered quite an achievement for the ordinary joiner to perform, though the expert finds no trouble in laying out and completing the work. The device shown at Fig. 4 was invented so that the process of forming such a rail might be simplified. This device as here presented was patented in the United States many years ago, but it seems never to have come into general use for some reason or another. The plank from which the rail is to be made is set up to the pitch of the stair, and the marker O which slides up and down the standard K makes the lines where the plank is to be cut for the rail. The pencil or scribe is fastened in a socket at A, the socket being moveable on the arm so as to be available at any point within the limit of the arm. The principle is an old one, in fact, as old as the works of Langley, Paine or Moxon. Another device for laying out a rail is shown at Fig. 5, which may be attached to a band-

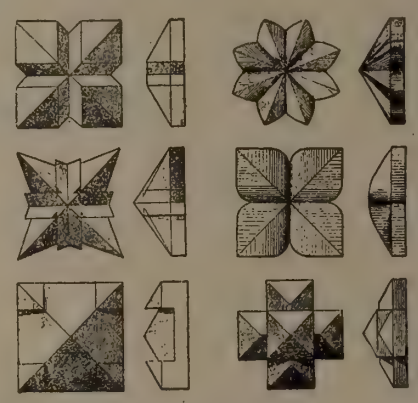

FIG. 3.—SPECIMENS OF WORK PRODUCED BY ATTACHMENT.

saw or to scroll saw. This machine is much simpler than the previous one. It may all be made of wood by any skilful mechanic. A shows the bace of the machine B, an inclined board which may be hinged to the base plank. A, C, is a standard with a cap through which a rod G is fixed. The standard C carries a moveable arm D, which has a slider carrying a pencil attached. This pencil-holder slides along the arm D, in order to suit the diameter wanted. When a pattern for the rail is to be made the hinged board B is raised to the pitch of the stairs, and the pencil point is moved until the proper diameter is reached, when a line like the one dotted is drawn. The inside line is also drawn when the paper or board on which the lines are drawn, are removed and the curver transferred to the plank to be cut. The plank is then cut by the band-saw or the scroll saw, while the plank is set up on a rake which is the pitch of the stairs. By this method the proper curve and the correct bevels are obtained; two very important items in hand-rail construction.

SOME KINKS IN CIRCULAR SAW WORK.

The form of outline of the slot or groove made by a circular saw not only depends on the size and the position it occupies on the saw arbor, but on the direction the material being worked is also moving. If we take a block of wood and move it across the bench lengthwise, the saw will simply cut a slot the width equal to the set, and the depth depending on the height of the table above the saw arbor. If we drive a block at right angles, or square across the saw table, a groove will be formed, having a cross section in the shape of a segment of a circle; any other direction will give a similar part of an ellipse. In Fig. 6 is shown a variety of work cut out

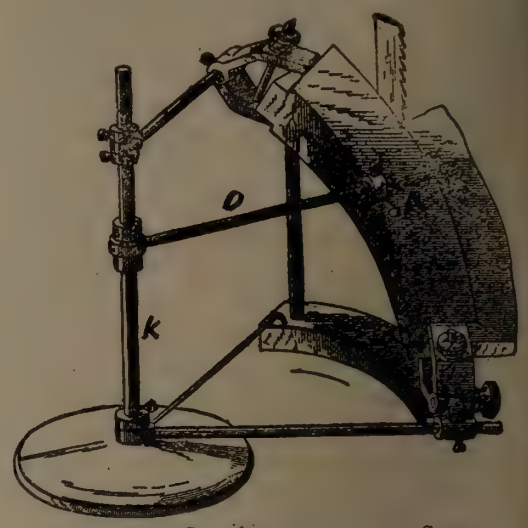

FIG. 4.—BAND SAW ATTACHMENT FOR SAWING CIRCULAR RAILS.

on this principle. No. 1 is a block cut out for lagging a pulley, or similar work; the other figures show various patterns, all of which may be cut out with a circular saw. When it is required to cut a circular groove of a given size at a saw bench, the table can be raised and the saw gauge set to the proper angle by means of the diagram shown in Fig. 7. If it is required to groove out the block A to the line C A D, on the saw bench, using a twelve inch saw, first draw the circle E M D, twelve inches in diameter, the same as the saw, then lay off on the radius E K, E F, equal to A B, and draw a line at right angles for the surface of the table. With F for the center draw the circle T H V, equal in diameter to C D. Now the line passing through M, and touching the circle at T, will make the required angle with the line M I. From the point M, lay off at right angles to S M, M L, equal to D N; set the saw gauge at this point, with the angle already found, and the saw bench is ready for the work. The teeth of the saw, for this

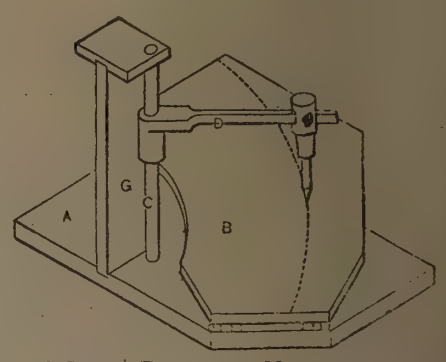

FIG. 5.—A SIMPLE DEVICE FOR MARKING OFF A RAIL.

purpose, should be very coarse, and filed so as to cut the whole length of their sides as well as their points. If three or more of the teeth could be made shorter than the rest, and at the same time given more set, it would improve its working qualities greatly. When the saw is fastened to the arbor by means of two wedge shaped collars, the same will "wobble" or "stagger", and will cut a groove, having parallel sides, but the bottom will be contact in sections,

as shown in the first diagram in Fig. 8. This can be made to give a flat bottom to the groove by jointing the saw while in motion, as shown in the second figure. By setting the saw off from the center, one corner of the groove will be made deeper than the other, but the sides will remain

FIG. 6.—SAWING COVES.

parallel. A dovetailed shaped groove may be made by tilting the stuff first on one side, and afterwards on the other; specimens of the dovetailed groove are shown in the lower sketches. Door stiles and door rails may be plowed for the panels by "wobbling" the saw as shown, and the panels get a better "grip' when fitting in a sawn groove. The size of the groove may readily be obtained by the proper adjustment of the bevelled washers; they can be turned on the arbor to give the saw the proper angle, and when the right position is once found, the washers and the saw can be marked, and the same adjustment can be made with little trouble when the same

FIG. 7.—ARRANGING SAW GAUGE.

size of a groove is wanted. The bevel washers may be made of hardwood—maple being about as good as any—and one pair of washers may be used for several sizes of grooves. The washers, if made of wood, should fit loosely in the arbor and should be true on both face, and each should be the exact counterpart of the other. In fact, it is better, when making the washers, to make the two out of one piece of stuff, boring the hole first, and then sawing them across the hole to the proper bevel. The iron collar and outside washer must be retained on the mandrel. The first bevel washer fits against the collar, then the saw is run on, then the round wooden washer, with its thick end opposite to the thin end of the first washer, then the rim washer, which must be followed by the tightening nut. The saw will then stand at an angle with the mandrel, and this is the object attained.

RAISING BLACK WALNUT FORESTS.

BY THOS. CONIANT.

In May, 1895, I planted about 5,000 black walnut trees on my lands about Oshawa, Ont. The trees are not all in one planting, but in four plantings on as many different farms.

I bought the young black walnut trees at Rochester, N. Y. My choice would have been to buy them at home, but I could not because no one had that quantity to sell. In the nursery these trees had been propogated. These I preferred because the black walnut, like the oak, is sure to have a long tap root, and hence it is usually the most difficult to transplant successfully. At first they were transplanted as grown in clusters from the seed in the nursery. During this transplanting the tap root, although then

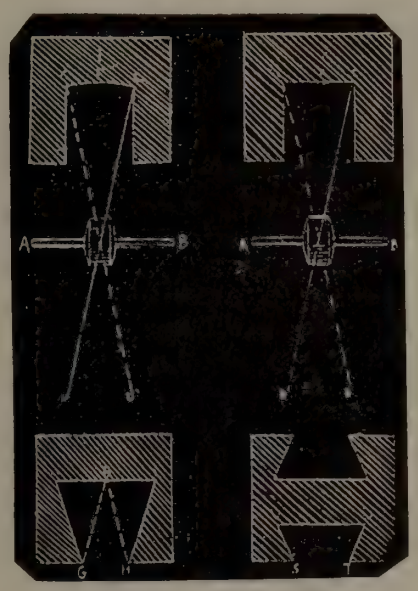

FIG. 8.—SAWING GROOVES AND DOVETAILS.

incipient, had been cut and the tree for itself threw out latent roots which gave it a better chance to live on being transplanted. Hence, by all means I prefer black walnuts for planting which have been previously transplanted.

Only 10 feet apart in rows each way I have set these trees, and if I were planting again I would set them closer. To cause the trees to grow high and produce trunks and not branches is the object, and thick planting will accomplish that most desirable end.

The year 1895 was an ordinary one in the way of rains, and to help them I caused them to be hoed during the hot and dry weeks of midsummer. No matter how dry the weather may be, it is a recognized fact that to stir the surface of the land, ever so lightly, produces moisture. In this manner I produced moisture for the young trees then about four feet high, and not by mulching or costly and tedious watering. At a glance one can see that to water 5,000 trees several times in a summer, would be a herculean task, and I did not attempt it. Not over five per cent. of these trees did I lose, nor have I lost since. From this low average of loss we may conclude that the process of hoeing around the trees served all purposes of mulching or watering, and at only a tithe of the cost.

After six years' growth I must say, in exact truthfulness, that there are about twenty-five per cent. which have not grown at all, only lived. Another twenty-five per cent. have increased in size about double from their originals, and the remaining forty-five per cent. are large trees, fully fifteen feet high and three inches in diameter.

Besides the pleasure which it constantly affords me to see these forests developing, I can already see my pay on a cash basis. Before the trees were set out the lands were worth $100 per acre, and now to-day, after five years' growth of the trees, I would have no difficulty in disposing of these lands at $500 per acre.

In this manufacturing town of Oshawa, any fair quantity of black walnut is worth $180 per thousand feet. And even at that price they can't get it, but use the veneer of walnut got from the mountains of Tennessee, which costs at the rate of $400 per thousand feet.

Not for myself did I plant these trees. As for that, I may remark that we do not live for self in other matters outside of tree planting; but to-day, these black walnut forests are valuable assets, and in thirty or forty, or possibly fifty years from now they will yield a fortune. No alloy or anything in celluloid ever has taken the place of black walnut, and its value cannot depreciate.

Walnuts I do not reckon upon for profit. Probably there will be a little profit from that source, but independent of that the financial venture is sound, and besides I feel that I am doing good to our glorious and beloved country and my fellow citizens.

In another article at some future time I will speak of my labors in planting many acres of the walnuts themselves. A record of my experience in that particular, and also of red cedar planting, will be sufficiently lengthy for a separate article.

Mr. Hiram Robinson has in his garden at Hawkesbury three walnut trees grown from seed planted by himself six years ago. These are the only ones which came up from a considerable number of walnuts which were planted, but they are now vigorous trees of about four inches in diameter, and have attained a height of probably twelve feet. The garden is somewhat sheltered, but the trees have not required any other care, not even a special covering for the roots, which are the chief point of danger for this tree in a climate as cold as that of Hawkesbury.—Rod and Gun.

A SUGGESTED BELT DRESSING.

A recently issued patent for belt dressing contains the following specifications:

Pure tallow	20	parts.
Lard	40	"
Common salt	10	"
Sugar	10	"
Rosin	20	"
Water	40	"

all by weight. The tallow and lard are melted together and the salt and sugar are dissolved in the water, which is then added to the tallow and lard at the same time as the rosin. The whole is boiled for one and one-half hours, by which time the water is all boiled out and the composition becomes froth and foam. A sediment amounting to about 3 per cent. of the solid constituents of the formula settles and is carefully removed. The claim of the patent is for the composition indicated, in the proportions specioed.—American Lumberman.

RELATIVE ADVANTAGES OF ELECTRIC AND SHAFTING DRIVING FOR SHOP USE.*

A comparison of the relative advantage of electric and shafting driving for shop use may be made under the following general headings :

1. Relative economy in cost of power itself.

2. Relative convenience of operation and installation.

3. Relative effect upon shop output and cost of labor.

Referring in detail to the scope of these considerations :

1. Economy.—This has been taken to comprehend only the relative cost of operating the two systems, including expense for fuel, attendance, repairs, interest on investment and depreciation. It is the reason most generally advanced for the installation of electric power, but can only be the controlling one where the cost of power is a large proportion of the shop running expenses.

In order to compare the relative efficiencies of engine and electric transmission, it will be necessary to subdivide the character of shop plants somewhat. To do this completely would lead to endless complication, but for present purposes the typical plants are :

1. Shop plant in which each building has its own power plant.

2. Shop plant in which all the buildings are furnished with power from a central source.

The matter of connection from the prime mover to the tools may be assumed, for an extreme comparison, in either of two ways, viz., (a) shafting method ; (b) individual tool driving method.

Taking the first condition the average efficiency from engine to tools for steam engine transmission is shown to be 50 per cent.; for electric transmission, under condition "a," the shafting losses will be reduced by splitting up long lines and by avoiding cross-belting, so that they will not exceed 20 per cent., or an efficiency of 80 per cent., and in the electrical elements, as before shown, the efficiency from engine to shafting is 65 per cent.; therefore, the final transmission efficiency will be 80 x 65 = 52 per cent., as against 50 per cent. in the purely mechanical method ; or, practically, a stand-off. Under condition "b," much less shafting will be employed, and the electrical portion may also show a better all day efficiency, under certain conditions, by the shutting down of idle machines—say, a shafting efficiency of 90 per cent. and an electrical efficiency of 66 per cent., or a resultant of 60 per cent.—showing a gain for the electrical method.

Taking the second condition and assuming an unfavorable condition for shafting transmission, as in case of a shop having each building with its own boiler plant and one or more engines, and compare this with a central power plant for electrical transmission to all buildings, the possible fuel saving in the latter arrangement will result first, from some small saving in power required for each individual building, as before shown, and second, from some very considerable saving due to the better efficiency of a large engine and boiler plant over that of several small ones. In extreme cases, where large condensing engines displace non-condensing ones, and in large stations having a uniform load, the fuel saving may readily approximate 33⅓ per cent.

The item of attendance will next be considered. If is made up of three classes of labor—engineers and firemen ; care of shafting and belting ; electrical repairs. In an electric system the cost can be reduced by consolidating the engine and boiler plants and by the elimation of large and heavy belts, large shaft bearings and the consequent danger from over-heating, reducing labor probably one-half ; but a new item of expense in care of electric machinery will be introduced, which will about offset the other items, leaving the whole attendance bill practically unaffected by the introduction of electric shop power in plants of any considerable size.

As to repairs of shafting and belting, it is difficult to obtain accurate data, the record of these items being seldom kept separately in shop accounts. The records of one large establishment have, however, been examined by your committee and the saving found in these items, under the electric driving system, is found to be more than sufficient to pay for all repairs to motors and lines. Thus the conclusion seems justified that the repair item will not be materially different under either system of driving.

The remaining items of power cost are depreciation and interest of investment. It is difficult to institute a fair basis of comparison between the first cost of an electric and steam transmission plant, for the reason that the results sought to be accomplished by the former provide additional shop facilities, and are therefore not rightly chargeable in a substitution sense. Considering, however, the case of simple substitution in a single shop, where the power plant and arrangement and number of tools is retained as before, electric driving is certain to involve a largely increased first outlay—approximately double that for shafting method. But in a modern shop plant other considerations are the guiding ones in a selection of the power system, such as the possibility of labor-saving devices, cranes, etc., and the greater cost of the electric system becomes a rightful charge against the advantages so obtained.

Dropping, therefore, any attempt to draw a strict comparison between first costs, it may be said that in estimating the total cost of power machinery it is usual to include an allowance for interest and for a sinking fund, with which to replace the plant when its utility is no longer on an equality with best practice. These items are generally figured together at 10 per cent. on first cost, a sum amounting roughly to one-fourth of the total running expenses of the power system.

CONVENIENCE AND SHOP OUTFIT.

These considerations are so closely interdependent that they can best be referred to together.

The ordinary shop plant with steam power transmission, both in the arrangement of building and of machines, is the slave to the limitations of this system; it must be laid out so that the shafting and engine connection is as direct and simple as possible ; the machines must be compactly arranged in parallel lines, and the ceilings and columns designed with special reference to shafting supports. In other words, the tools must be installed with first reference to the application of power, and not, as should be the case, with reference to handling the work to best advantage. Handling operations are of necessity largely by manual methods, and the shop buildings, even, must be located with first view to getting the power to them with the least awkwardness and expense.

While generalizing in this manner, your committee has not lost sight of the fact that handling and transferring machinery may be operated by other means than electricity, but it is equally true that devices of this nature are of limited practical application, and the broad fact remains that electricity is to be credited with ushering in a new era of labor-saving shop devices.

Electrical transmission places no restriction on the location of the machines, and each shop may be planned with a view to handling its product with least waste of labor and with the greatest convenience of access to the tools. These may even be transported from place to place to the work ; further, the partial or entire absence of overhead line shafting insures better lighting of the shop and conduces to cleanliness. These factors promote cheerfulness and an improvement in both quantity and quality of output.

The clear head room permits the universal application of various forms of travelling cranes for serving the tools and for conveying operations, furnishing the most efficient means yet developed for increasing shop economy, and as a means of communication between buildings, electric cranes and transfer tables have advantages over appliances of the same nature driven by steam and air.

SPECIAL APPLIANCES.

In these, electricity shares a large field with compressed air. It must be admitted that air devices have up to the present time received most attention at the hands of the railway mechanic; a fact in large part due to the lack of practical knowledge of the electrical specialist and to the greater cheapness of air tools. With, however, the general introduction of electric shop power plants and the better acquaintance of practical men with the agency, an extensive application of electric labor-saving devices is certain to result.

Flexibility.—The extension of a shop building or the tool equipment under the shafting system is generally a matter of much difficulty, and the attempt to add to such a plant often results in inconvenient crowding of the tools or to an overloading or complication of the shafting system, a fact which fully accounts for the extremely poor efficiency sometimes quoted for shafting transmission. In an electric system, on the other hand, great flexibility in extension is secured, as new buildings may be placed in any convenient position, and additions made to the driving system without affecting the intermediate links.

Speed Control. — The ease of speed control between wide limits of certain types of electric motors is a valuable feature and will result in more frequently securing a greater adaptability of the tool to the work than is possible where a change in speed involves stopping the tool and shifting belts and gearing.

Increase in Output.—This constitutes, in the opinion of your committee, the chief claim of electric transmission to the attention of shop managers, and follows from the previously mentioned facts, as, by the use of electric handling devices, the tool is quickly served with its work and the product placed in the most favorable position for operating upon and idle time cut down, and, by independent driving, the capacity is increased by reason of the perfect control of speed possible.

*From a report by a committee to the Master Mechanics' Convention, held at Saratoga, N.Y., July, 1900.

CANADA LUMBERMAN

WEEKLY EDITION

The Lumberman Monthly Edition, 20 pages } $1.00 PER YEAR { The Lumberman Weekly Edition, every Wednesday

THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN, THE UNITED STATES, AND OTHER FOREIGN MARKETS.

VOL. VI. TORONTO, ONT., JANUARY 2, 1901 No 49

CANADA LUMBERMAN

PUBLISHED BY

The G. H. Mortimer Publishing Co'y of Toronto, Limited

Confederation Life Building - TORONTO.

Branch Office:
IMPERIAL BUILDING, MONTREAL.

Weekly Lumberman, published every Wednesday. Contains reliable and up-to-date market conditions and tendencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canaian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

Lumberman, Monthly. A 20-page journal, discussing fully and impartially subjects pertinent to the lumber and wood-working industries. Contains interviews with prominent members of the trade, and character sketches and portraits of leading lumbermen. Its special articles on technical and mechanical subjects areespecially valuable to saw mill and planing mill men and manufacturers of lumber products.

☞ Subscription price for the two editions or one year, $1.00.

WANTED AND FOR SALE

Advertisements will be inserted in this department at the rate of 15 cents per line each insertion. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed. This notice shows the width of the line and is set in Nonpareil type; 12 lines make one inch. Advertisements must be received not later than 4 o'clock p.m. on Tuesday to insure insertion in the current week's issue.

FOR SALE.—36 in. Wickes Gang, cutting 14 in. deep; located in Canada; price low. WICKES BROS., Saginaw, Mich.

WANTED—500,000 split cedar shingles. Quote price F.O.B. nearest shipping port. Address, HORWOOD LUMBER CO., St. John's, Newfoundland.

FOR SALE—2,000 arpents Hardwood Limits near St. Hilaire Station, only 22 miles from Montreal—Red Oak, Maple, Beech. B. F. CAMPBELL, St. Hilaire Station, Que.

WANTED, BASSWOOD AND SPRUCE, 1", 1¼ in., 1½ in., 2 in. common and better, also 1 in. cull soft elm and basswood. R. E. KINSMAN, Hamilton.

FOR SALE.

SAW MILL, COMPLETE, CAPACITY SIXTY M feet per ten hours; local railway shipping facilities, British Columbia. Address T.R., care this paper.

FOR SALE.

CEDAR SHINGLES, XXX AND XX; ALSO cedar posts. For particulars address, HARRISON & HAWKE, Shallow Lake, Ont.

FOR SALE—SAW AND SHINGLE MILL, with stock of logs, also a comfortable dwelling and stables in connection. Near the Canada Atlantic Railway. This is a snap for cash, write for particulars.
S. A. RANKINS.
Falding Ont.

WANTED.

WANTED AFTER JAN. 1ST., POSITION AS Manager or General Superintendent of Saw Mill, or to take charge of Construction of New Mill or saw by the M, by man who can furnish unexceptional reference as to experience and ability. Address P. O., Box 497 Ottawa Post Office, Ottawa, Ont.

WANTED.

SAW AND PLANING MILL COMBINED, AT Acton, Ont.; well equipped and machinery in perfect order. Plenty of timber with which to operate for many years; wood business in connection. Business well established and profitable. For further particulars and terms apply to the proprietor.
JAMES BROWN,
Acton, Ont.

WANTED

GREEN HARD MAPLE SQUARES, 6½x6½ in., 12 feet and up. Cash on delivery at any station in Ontario or Quebec. Address Box 40, CANADA LUMBERMAN.

WANTED

(THIS IS A PROFITABLE INVESTMENT.)

IMMEDIATELY, A PARTY ABLE TO FINance the operations of a large spruce limit producing four million feet a year of fully manufactured stock. Operations are now active. Capacity of plant is three thousand feet per hour. There are seven hundred thousand feet of seasoned lumber and one million feet of logs now on hand. Apply, stating terms and interest, to MANAGER, Box 911, Makinak, Manitoba.

Limits and Saw Mills FOR SALE

The proprietors having decided to retire from this business, offer their Valuable Limits and Mills for sale. The concern is well equipped in every respect and is in operation. The cost of operation is very moderate, having about 30 miles of railway (Lake St. John) running through it. The Mill at Lake Edward is Circular Saw; that at Pearl Lake is St am Feed Circular and Gang.

The Limits, about 280 miles, have considerable Spruce and Pulp Wood, also Boulean and Birch. These latter have exceptionable quality, and by judges considered the best in the Province of Quebec. For terms, etc., apply to

WHITEHEAD & TURNER,
Quebec City.

CURRENT TRADE CONDITIONS.

ONTARIO.

"Inquiries for bills for next season are already coming in, and prospects for the season of 1901 are considered very bright." This is the manner in which a manufacturer in western Ontario refers to the outlook for the lumber trade, and his views are endorsed by other manufacturers from whom information has been received the past week. Some Georgian Bay mills have already sold their coming season's cut of British deals, while an increased inquiry for the lower grades is reported from all sections of the province. Without being too optimistic, it can be safely said that an active trade in lumber will characterize the early spring, and there is reasonable hope of higher prices at least for certain grades. Michigan consumers of lumber will, in all probability, obtain a greater portion of their supply in Canada this year than ever before, as the production of pine lumber in that State is now of no account.

There are considerable stocks of hardwood lumber in some districts, but it is not anticipated that there will be any general reductions in price, as this is scarcely possible unless sales are made at a loss, owing to the high prices paid for logs. It is expected that there will be a small production of hardwoods the coming season.

QUEBEC AND NEW BRUNSWICK.

The outlook for the lumber trade of the eastern provinces is brightening, although sales for immediate delivery are few. For spring delivery, however, many enenquiries are being made. During the past few months there has been little demand for spruce clapboards, the price of which has remained low. Enquiry has now become more active, dry stocks are getting cleared out, and prices are showing a tendency to advance. British trade is quiet. Shippers are still unable to close contracts on account of the uncertainty of the European marker. New Brunswick cedar shingles are again a little weaker, selling as low as $2.80 for extras, $2.40 to $2.50 for clears, and $1.75 to $2 for second clears.

UNITED STATES.

While there was a falling off in trade towards the end of the year, all kinds of lumber give evidence of continued stability. An encouraging feature is the continued volume of enquiry and the placing of many orders for early spring delivery. The end of the year found stocks at many manufacturing points badly broken. On the upper lakes there is said to be a shortage of 12-inch No. 1, 2 and 3 boards, 10 inch No. 1 and 2 boards, and 2x12 piece stuff in 12, 14 and 16 foot lengths. Laths are also in short supply. A few sales of the cut of 1901 have been made at a slight advance on last season's prices. In the saginaw valley manufacturers, with few exceptions, have little stock in their yards. Log run is quoted at $16 to $18, box lumber at $12 to $16, Norway bill stuff at $16 and upwards, and mill culls at $12 and $14. At Buffalo the stock of pine lumber is not heavy, and a general scarcity of the higher grades is reported. Some efforts have been made by dealers to add to their supply from Ontario, but it is said that prices generally have been found too high. Spruce continues to gain in strength and advances are looked for early in the year. Although hardwoods are quiet, no weakness is shown. More than the usual number of enquiries are reported, and there has been some good buying for January delivery. Plain oak has gone up another $1.50 in New York, now selling at $46 and better.

The tendency of shingles is strong. Buffalo dealers are finding more enquiries for red cedar shingles than for pine, the difference in price being 50 cents. On the Pacific coast cedar shingles have been advanced another 5 cents.

GREAT BRITAIN.

Advices from Great Britain tell of an unchanged condition of the lumber market. Importers are declining all overtures, and few sales of importance have been made. One report states that London importers have not yet purchased any deals and battens for next year, but several contracts for special goods, such as slating battens and weather boards, have been closed. There is yet much uncertainty as to the prices whcih will rule for spring shipments. Some Baltic manufacturers are said to have sold 11 and 9 inch deals at the same prices as ruled last season, and 7 inch battens 5 shillings lower. Prices for goods on spot are not improving. Notwithstanding the drop in spruce prices, there is little movement in the sale of deals and planks, and it would seem that consumers are expecting a further decline in prices. A few sales of third pine deals have been made at £11 12s 6d per standard for 3x9 in, 12 to 13 ft. in length. At an auction sale held by Hodson, Mabbs & Company, 3x11 Quebec spruce brought only £9 5s, which is considered a little below market value.

STOCKS AND PRICES.

D. L. Mather, of Rat Portage, Ont., intends taking out 275,000 railroads ties this winter.

The unsold stocks of lumber at Duluth and Superior at the close of the year amounted to 129,000,000 feet.

The South River Lumber Company, of South River, Ont., have sold their 1901 cut of deals at prices about the same as last year.

The bark St. James sailed from Chemainus B. C., last week for Melbourne, Australia, with 1,200 000 feet of lumber, valued at $12,000.

John Carew, of Lindsay, Ont., is getting out a large stock of logs and railway ties in North Victoria and Peterborough county this season.

The Goderich Lumber Company, of Goderich, Ont., are taking out this winter only hemlock and cedar timber, for which they find a ready market.

The Saginaw Lumber & Salt Company, of Saginaw, Mich., will, it is said, have 15,000,000 feet of logs for rafting to Michigan next season, these being cut on Indiana reserve lands.

Seaman & Company, of Port Arthur., Ont., contracting lumbermen for the New Ontario and Rainy River railway, have let contracts for 250,000 ties to be taken out this winter between Port Arthur and Steep Rock Lake. They will employ 400 men. Several small saw mills along the line east of Sturgeon Falls will be moved to Seine river and Little Turtle lake, and several million feet of piling and bridge timber will be taken out. Sub-contracts have been let to the following: Bartley & Mosher, 5,000,000 feet of logs; Tierney & Fraser, 5,000,000 feet of logs, 25,000 ties, and a large quantity of piling; Brownlea & Campbell, 30,000 ties, and about 50,000 feet of piling. The building of the road will involve the construction of two bridges across the Rainy River, one near Baudette and the other at Fort Frances.

The failure is announced of the Alexander Timber Company. Limited, of Cardiff, England. Among the creditors are: Bunstall & Co., Quebec; R. R. Dobell, Quebec; R. R. Dobell & Co., Quebec; W. & J. Sharples, Quebec; Farnworth & Jardine, Liverpool; A. F. & D. McKay, Liverpool; Pierce & Pierce, Liverpool.

The tendency of the freight market is downwards. Several steamers have been fixed from Miramichi to w.c. England at 52s 6d for first-open-water shipment and one of 1,500 standards at 52s 6d to Liverpool or Manchester. Four small sailers have been chartered, Bay of Chaleur to w.c. England, at 52s 6d, and two from Halifax to west coast at 50s 6d and 50s. From the river St. Lawrence charters have been effected at 51 3d to 51s 6d.

THE BOSTON MARKET.

The spruce lumber market is steady and featureless. It is possible that the tone is just a shade easier, since one or two small mills have gone to sawing, but values are not changed, with even more than agreement prices paid for frames, if wanted at once or within a few weeks: Ten and 12 inch dimensions, $18; 9 inch and under, $16; 10 and 12 inch random lengths, ten feet and up, $17; 2 x 3, 2 x 4, 2 x 5, 2 x 6, 2 x 7 and 3 x 4. 10 feet and up, $14.50; all other randoms, 9 inches and under, 10 feet and up, $15.50; 5 inch and up, merchantable boards, $15; matched boards, $17 to $17.50; out spruce boards, $12.50; bundle furring, $14.

Hemlock is very steady, with offerings limited: Eastern stock boards, $14.50 to $15.50; random, $13.50 to $14.50; Pennsylvania, $16 to $17; boards, rough, $12.50 to $13.50; planed, $14 to $14.50.

Western pine is firmer, with shippers claiming a stronger market: Uppers, 1 in. $58 to $62; 1¼ to 2 inch, $63 to $64; 3 and 4 in. $68 to $72; selects, 1 to 4 in. $52 to $64; fine common, 1 to 3 in. $45 to $60; sheathings, $38 to $54; barn boards, $28 to $30; coffin boards, $24 to $26.

Hardwoods continue in quiet request with little change. Whitewood is in fair demand: One inch whitewood, $36 to $38; thicker, $38 to $42; ⅝ inch, $30 to $33; saps, inch, $25 to $30; common, $23 to $25; quartered oak, $65 to $75; fancy, $85 to $95; plain oak, $35 to $45; ash, $38 to $45; cherry $90 to $130; maple, $30 to $40; sycamore, quartered inch, $40 to $50; walnut, $100 to $130.

Shingles are considerably irregular. British Columbia shingles are in good request, with dealers behind with orders. Eastern orders are irregular. Dealers say that they are offering a good many New Brunswick shingles at $2.75 for extras, without buyers. Other dealers say that the market is better cleaned up at $2.85. It is certain that the present demand is light, and that building will have to be better than last year to take care of even a small cut: Extra cedar, $2.75 to $2.85; clear, $2.45 to $2.50, second clear, $1.75 to $2.10; clear white, $1.65 to $1.85; extra No. 1, $1.85; British Columbia, 16-inch, five butts to 2 in. $3.10 to $3.15.

Clapboards continue in small supply, with a dull market: Extra spruce, $29 to $30; clear, $27 to $28; second clear, $24 to $25; pine, extra, $36 to $38; clear, $33 to $37; second clear, $28 to $30; California redwood, clear, $42.50 to $45; second grade, $40 to $42.

Laths are fairly firm, but trade is quiet: 1⅝-inch, $2.80 to $2.85; 1½-inch, $2.60 to $2.70.

Boston, Dec. 31st, 1900.

The output of hemlock in Michigan this winter will be much less in quantity than last season, owing to the unsatisfactory condition of the hemlock market. Hemlock logs are said to be offering at $3.50 and $4.00.

THE BRITISH AND NORTH AMERICAN TIMBER COMPANY LIMITED.

AGENTS FOR ALL KINDS OF LUMBER — 57 GRACECHURCH ST., LONDON, E. C. — ADVANCES MADE TO SHIPPERS.

We scarcely realized the great sacrifice that was made by the selling of lumber at the low prices which ruled during the recent years of depression. I am told that about the year 1896 Michigan manufacturers hauled lumber in sleighs across into the Canadian Soo and sold it at $4 per thousand feet. This same class of lumber now brings $12 per thousand. Even the refuse of the woods has now become valuable. The Sault Ste. Marie Pulp & Paper Company, for instance, are said to be buying the refuse of pine, spruce, balsam and temarac, and paying $2.50 per cord delivered at the Soo. Until recently this material was regarded as worthless.

* * *

From a resident of Blind River, Ont., I learned something of the work under way which promises to make that point one of the most important lumber producing centres in Canada. In July last Eddy Bros. & Co. of Bay City, Mich., commenced the erection of a saw mill there, and up to the present time $100,000 has been spent in construction work. The machinery of their Michigan mill is being used, it being transported to Blind River by vessel. Some 400,000 brick have been used in the construction of the mill and accompanying buildings, and 600,000 feet of lumber was brought over from Michigan for the purpose. There will be boiler capacity of 1,000 horse power, installed in a stone power house. The capacity of the mill when completed will be 1,000,000 feet per week. Upwards of 150 men are now employed in connection with the building of the mill, a large boarding house, and a number of smaller houses. These figures will give an idea as to what such an establishment will mean to the village of Blind River. I understand also that the Michigan Land & Lumber Company, who purchased the mill of the Blind River Lumber Co., intend to double its capacity, bringing the output up to 120,000 feet per day.

* * *

The natural conclusion would be that the high ocean freight rates which ruled during last season would have caused a reduction in the quantity of trans-Atlantic lumber shipments. In the aggregate this is true, as statistics prove; but there seems to have been exceptional instances in which the result was different. Talking with an exporter of hardwoods recently, I could readily discern that he was not altogether satisfied with the final summing up of his first year's business. The question "How about your British trade?" gave him an opportunity to explain. "The British trade is alright, but circumstances are against us. Freight rates are enormously heavy, and we must compete with other countries more advantageously situated. Just because freights were high we shipped a good deal of stock this year, thinking there would be very little on the market, but we found that others were playing the same game, the result, of course, being an overstock. We also find difficulty in getting stock manufactured to British specifications. In my opinion, the only way to handle the old country trade is to invest heavily in special mill equipment for the purpose, and the question is, will it pay, or will the quantity of available hardwood timber in this country warrant the outlay. I tell you," he concluded, "the British specifications are severe."

* * *

A couple of weeks ago I met in Toronto Mr. J. M. Bird, who manufactures lumber in Bracebridge, Ont. Referring to conditions in the Georgian Bay district, Mr. Bird said that he could not recollect such a flood in the fall of the year as that which occurred in November last. The streams were raised many feet, the North river rising fully eight feet. Millions of feet of logs that were hung up were carried into safe waters, and some of these logs have ere this been manufactured into lumber. He estimates that fully 200,000,000 feet of logs were stranded before this freshet occurred. In Mr. Bird's opinion hemlock lumber will bring high prices during this year, as logs in lengths of 26 to 30 feet are selling at $6 per M, 16 to 18 feet lengths at $5.25, and hort lengths at $4.50. The output this winter, he says, will be unusually small, owing to the scarcity of timber and the difficulty in securing men to peel the bark. Last summer it was found almost impossible to get men to go into the woods to peel bark and put up with the unpleasantness of mosquitos and other inconveniences. As showing the strength of the hemlock log market, Mr. Bird cited a case in which the son of a farmer had sold their logs for a certain figure, but when the buyer met the father he was advised that the purchase must be made through him, and that the price was $1 per thousand higher than had been quoted by his son.

WIRE HOOPS FOR COOPERAGE.

OWING to the great scarcity of elm, of which most of the hoops for slack barrels have been made, Canadian manufacturers of cooperage stock will be interested in the experiments with wire hoops which have been conducted by the American Steel & Wire Company. We learn from the Barrel and Box that late experiments with wire bilge hoops and neck hoops on all kinds of slack cooperage demonstrated the fact that wire hoop of proper gauge and the right grade a of wire was much stronger than elm, and if properly driven would be superior in every way. The trouble was that the driving, being done by hand, was uneven and not sufficiently tight.

As a result of still more recent experiments, the company above mentioned is said to have succeeded in producing a steel wire hoop of proper grade, and also a machine for driving the hoops upon the barrels. With this machine it is claimed that one man, without any help, can put two wire bilge hoops in a single day of ten hours on 2,400 barrels, every hoop being driven on perfectly tight and even around the entire circumference of the barrel.

In order to test the hoops a severe trial was ordered in the way of using the wire hoops on a cargo of 8,000 salt barrels. The cargo arrived at its destination in the best condition, the barrels on the bottom tiers holding their shape perfectly. The percentage of barrels caved in on account of the great weight on the lower tiers was less than in the case of barrels hooped with wood.

An illustration of the cargo as it was being unloaded is shown herewith.

The cost of the wire hoops is said to be consideraby less than that of wooden hoops. It is the intention of the American Steel & Wire Co. to supply the machine free of charge to the trade using wire hoops.

UNLOADING A CARGO OF BARRELS HAVING WIRE HOOPS.

TRADE NOTES.

Mr. R. H. Cronkhite, of Bay City, Mich., recently visited Georgian Bay lumbering points in the interests of the M. Garland Company, manufacturers of saw mill machinery, of Bay City.

The Canadian Oak Belting Co., of Montreal, have removed their belt factory to Brockville, Ont., having purchased the tannery there formerly owned by MacLaren & McCrady. This tannery is equipped with modern appliances for tanning a superior quality of oak tanned leather, especially suitable for the manufacture of leather belting. The tannery and belt factory will be under the direct management of Mr. J. D. McArthur, who has had twenty-eight years' experience in the business. They will continue their office at 771 Craig St., Montreal.

J. W. Bowden & Co., 67 Adelaide street east, Toronto, have furnished the following parties with Talismanic belt clinch: Grand Trunk Railway system; Montreal Street Railway Co.; Christie, Brown & Co., Toronto; James Stewart Mfg. Co., Woodstock; Thompson Paper Mills, Napanee; Parmenter & Bullock, Gananoque; Ottawa Car Co.; London Machinery Co., and others.

The firm of W. Doherty & Company, organ manufacturers, Clinton, Ont., is among the largest consumers of lumber in Canada. Their new premises cover an area of 20 acres of land and represent an investment of upwards of $250,000. Their supply of timber is obtained chiefly from their own limits, and their manufacturing department embraces saw mills, dry kilns and prospective veneer mills. The saw mill is steam power and equipped with modern machinery. The dry kiln has a capacity of 100,000 feet of lumber and is one of the largest and most efficient in Canada. It is constructed on the department fan and coil blast system, and heated by both exhaust and live steam. The company also deal in lumber.

The subscription price of the CANADA LUMBERMAN (including weekly edition) is but one dollar per year to subscribers in Canada and the United States.

NOTES FROM THE EASTERN PROVINCES.

[Correspondence of the CANADA LUMBERMAN.]

The building boom in Sydney, C. B., is causing quite a run of lumber in that direction, but at present it is almost impossible to secure what is wanted at the proper time. At this season the importations by water have stopped, and now none can be obtained by that method from the north shores or Gaspe, nor from the Atlantic coasts of Nova Scotia, owing to the enormous pressure recently placed upon the Intercolonial Railway by reason of the supplies to be carried, not only to the towns and vicinities, but especially to the Dominion Iron and Steel Company, who have to import enormous quantities of building equipment. It is almost impossible to secure anything by rail on time. Stocks in Sydney do not seem to be very large nor at all adequate to the demand, and the consequence is delay and annoyance to the builders while waiting for the receipt of the lumber. Cars are delayed on the road for all lengths of time. One recently received from Windsor, destined to Chappell Bros., came through in the phenomenal record time of six days—the quickest delivery experienced by that firm in their imports here. The freight on this carload was $60.35, it being a large box car of kiln dried stock. The average shipment from Windsor requires about 15 days, it is said, and one carload took 26 days in transit. The delay, however, must be considered excusable under the circumstances, and the I. C. R. is now placing sidings and improving facilities as fast as possible to meet the requirements of trade.

Another large lumber dealer in Sydney states that cars of lumber destined to him from Amherst recently took between seven and eight weeks in transit. One car from Dalhousie, which left there on October 19th, arrived on December 9th. Considering this delay, the charges for transportation seem excessive. Some of the dealers have stated that the rates are exorbitant. It should, perhaps, be considered that builders in Sydney are making a better thing out of their operations than under old or ordinary circumstances, and in view of the I. C. R. being so over-rushed with traffic, they should be allowed some latitude. The rates, are, however, undoubtedly high. In November they were raised two cents per cwt. between Sydney and Amherst, and now are 10½ cents per cwt. on lumber.

Lumber is brought by rail principally from Colchester, Cumberland and Hants counties in Nova Scotia, and a large amount comes down from Sackville. Up to a few weeks ago, the north shore of New Brunswick supplied its lumber by schooners, and a large amount was brought from Gaspe by water.

It is to be regretted that Cape Breton, which has so many natural resources of all kinds, seems to be so meagrely supplied with merchantable lumber. What is on the island seems to be stubby and stunted, and the country is too rough to allow of its being procured with profit. There are some mills, but the largest dealers say that they have never had any satisfaction in handling Cape Breton lumber. It will not saw up advantageously for trade purposes. At the same time there is reason to believe that the forests have not been properly exploited, and that some trade will yet result. Inquiries made of all the dealers in Sydney result in the information that hardly any C. B. lumber is being used here.

It would seem that the growth is much better adapted to pulp manufacture, being of such short and stubby growth, and it is to be hoped that the pulp mills now projected in the neighboring counties will be built.

A glance at the map shows the possibilities open to lumber shippers in Newfoundland, and it is strange that so little lumber comes from there, only a few cargoes having been received so far. Newfoundland is much nearer than the shores of New Brunswick, and especially the Gaspe coast, and a local trade should be easily worked up. Mr. Reynolds Harrington reeently procured a few schooner loads from there and expects to turn his attention in that direction more in the coming season. Other dealers state that prospects are good for lumber trade there. Messrs. Schurman, Lefurgey, Clarke & Co. intend to import from there.

Retail prices in Sydney are high. Hemlock, which last year was worth about $8, is now selling at $11 and $12.50. Scantling ranges from $13 to $15. There is not much demand for spruce in boards. Pine can hardly be obtained at all, and is high, varying from $20 to $25. What spruce is sold brings about $12 for rough, and air dried flooring, edged, brings $15, matched $16. Hardwoods are very scarce and can hardly be obtained, though sold in small lots. Birch and maple retails at $20. Cedar shingles, which come down from Gaspe, Dalhousie and Campbellton by boat, have maintained the same prices all summer—Extras, $2.60; Clears, $2.40; 2nd Clears, $2.00; Clear White, (3 star) $1.80; Extra No. 1, $1.40. Spruce shingles sell at about $1.50 and $1.60. Last year they were about $1.25. Laths are worth about $2; No. 2 pine clapboards, $12; No. 1 pine clapboards, $18; Extra No. 1, $24-25.

Messrs. Schurman, Lefurgey, Clarke & Co., Limited, the well known contractors and builders of Summerside, P. E. I., who have now an important branch in Sydney, are large importers of lumber. They buy largely of the Jardines in Richibucto, N. B. They have been buying pine doors from the Rathbuns of Deseronto, and find they get them cheaper and of better quality than from any manufacturer down this way, the freight amounting only to about 10 cents per door. Reynolds Harrington is perhaps the largest dealer in this line, and does not manufacture in any way. He has a number of vessels of his own in the trade. Besides buying in New Brunswick and Gaspe he gets a large amount from Sheet Harbor, Sherbrooke, Bridgewater and Liverpool, though the bulk of his trade is to the northward, and he brings lumber in by rail from northern Nova Scotia. The rates by boat from the north shore and from the south shore of Nova Scotia vary between $1.50 and $2.00. Rhodes, Curry & Co. retail lumber also.

Chappell Bros., who are large contractors and builders here, import lumber largely. They are now forming a limited stock company under the name of Chappell Bros. & Co., the arrangements of which will be completed in a few days. They will go largely into the manufacturing of building material and will begin early in January the erection of a three-story factory about 60 x 100 feet. This is to be equipped largely with machinery from their old factory in Windsor, N.S., but they will put in a new resaw, planers and moulding machinery and an up-to-date sand papering machine. They are undecided whether to buy in Canada or the United States. They will also put in a new engine of about 80 h. p.

John J. Grant has a lumber yard and shops in New Glasgow, N. S., and deals largely in lumber, buying mainly in the county. He imports white fir from Newfoundland. He does a large amount of contracting and has just completed a contract for building the stations along the new Midland railroad from Truro to Windsor.

The firm of Donald Grant & Sons, also in New Glasgow, have a good reputation as contractors and builders, and run a sash, door and blind factory in which they also turn out house finishing of all descriptions and office and church fittings.

Barry Bros. have a saw mill about a mile outside of Pictou, N.S., both steam and water power, which contains a rotary and shingle machine and a full line of sash and door machinery. As they have to rail all logs they work under some disadvantage and use their mill only for order work. They do a general business in lumber and building material of all kinds.

The Oxford Foundry and Machine Co., of Oxford, N. S., have been doing a good business recently, and apart from their manufacture of railroad switches, marine and electric light engines, etc., have been turning out a large amount of mill machinery. They have a $15,000 plant and stock, opened up but a few years ago, after a disastrous fire which left them almost nothing. Alfred Dickie is using a mill built by this firm, in his mill at Ship Harbor. They recently shipped an edger to Sumner & Co., of Moncton, which is to be used at Red Pine. They also sent one to Monroe & McKenzer at River John, N. S. Among recent contracts might be mentioned: A portable mill for Logan & Sutherland, Ship Harbor; an engine for the American Furniture Co., Oxford; and an engine of 60 h. p. for the same company. The firm has been employing about 30 hands and has been working night and day since early summer. This factory has an equipment of large machinery, including a three-ton hand-crane, which is most convenient.

Wm. A. Robertson, now in Sydney, C. B., intends to build and equip a wood working factory in Bridgewater, N.S., where he will turn out all lines of builders' supplies and material, making a specialty of doors and sashes. He intends to put in, among others, a new moulding machine, buzz planer, turning lathe, band saw and saw table, and an engine for power purposes. He would be pleased to hear from manufacturers of these goods.

The firm of L. M. Poole & Co., in Charlottetown, P.E. I., handle a large portion of the lumber importations to P. E. Island. They buy largely in New Brunswick and generally keep about $18,000 worth of stock on hand. At present they say their stocks are low, and that they must buy largely in the spring. They suffered a loss of $90,000 when the Mary Elder was wrecked in the middle of November. M. P. Hogan imports a large amount of lumber from Nova Scotia, New Brunswick and Quebec, and gets his whitewood, cyprus, oak, etc., in the States. His business is largely as a manufacturer of doors, sash, and building materials. He is thinking of retiring from business in the spring and is completing arrangements to dispose of the business, plant and stock. He has been in business for 26 years.

A. P. B.

A LARRIGAN FACTORY.

Our Maritime Province correspondent sends the CANADA LUMBERMAN the accompanying illustration of the factory of Mr. J. S. Henderson, of Parrsboro, N. S., who manufactures larrigans, shoe packs, moccasins, etc., and to whose business reference was made in last issue. For some years Mr. Henderson has had a small tannery in Parrsboro, but he only recently went into manufacturing on a large scale. Last summer he enlarged the tannery, putting in ten new vats. Two years ago he built a new factory and equipped it with modern appliances, but the growth of his business has been such that further additions are necessary and will be made this year. Mr

FACTORY OF J. S. HENDERSON, PARRSBORO, N. S.

Henderson employs about seventy-five hands. His goods have obtained an excellent reputation and are regarded as second to none in the market.

REBATE ON EXPORTED TIMBER.

THE British Columbia government gave notice on August 23rd last that the rebate on all timber exported beyond the limits of the province was discontinued on July 1st, 1900. This regulation was afterwards amended so as to provide that the rebate be allowed to and discontinued from December 31st, 1900, on all timber shipped to foreign ports without the Dominion. The lumbermen of British Columbia contend that they would benefit little by this change, as much of the lumber and shingles is shipped to the eastern provinces, and consequently would not be allowed the rebate. They hold also that the drawbacks surrounding the manufacture of timber in British Columbia are such that the rebate should be allowed as heretofore. The representative lumbermen of the province held a conference with the members of the government on December 11th and presented their views. The delegation included: John Hendry and C. M. Beacher, of the Hastings mills; William Sully, of E. H. Heaps & Co.'s shingle mill; L. A. Lewis, Brunette mill; J. W. Hackett of Robertson & Hackett; J. M. Poitris, North Pacific Lumber Co.; A. Haslam, Nanaimo; Joseph Sayward Victoria; E. J. Palmer, Chemainus; J. G. Woods Moodyville; T. Kirkpatrick, Vancouver; J. A. McNair Hastings Shingle Co.; T. F. Patterson, Canada Pacific Lumber Co.; H. H. Spicer, of Spicer's shingle mill; and W. T. Stein, secretary of the British Columbia Lumber & Shingle Manufacturer's Association. The result of the conference has not been learned.

—Henry Lloyd has built a new saw mill at Walkerville, N. S.

THE NEWS

—W. W. Carter is rebuilding his stave mill at Fesserton, Ont.

—William Attig, saw miller, Newton, Ont., has sold out to M. L. Jantze.

—J. B. Poisson & Company will deal in pulp wood, with headquarters at Gentilly, Que.

—Tanner Bros., of Waubaushene, Ont., are making extensive repairs to their saw mill.

—William Halliday, of Wingham, Ont., has purchased a saw mill at Dobbinton, Bruce county.

—The erection of a new planing mill at Midland, Ont., has been commenced by John Munro.

—Vallee & Jobin have registered a partnership in the saw milling business at St. Thecle, Que.

—J. Guardhouse is opening a lumber yard at Rathwell, Man., and will handle United States lumber.

—The Georgia Logging Company, Limited, of Vancouver, B.C., has been incorporated, with a capital of $10,000.

—R. P. Legate & Company, of Ceylon, Ont., desires to engage a head sawyer and a competent man for planing mill.

—It is reported that N. Wilkes is organizing a company to manufacture wooden specialties at Brantford, Ontario.

—The saw mill at Shebashekong owned by Dillon & Thompson has been purchased by McKinnon & Company, of Parry Sound, Ont.

—The Truro Foundry & Machine Company, of Truro, N.S., have built a portable saw mill for McKenzie & Graham, of Riverside, N.S.

—The Bryan Manufacturing Company and D. G. Cooper, of Collingwood, Ont., are about to make extensions to to their saw and planing mills.

—The C. Beck Mfg. Company purpose enlarging their box factory in Toronto and installing the most modern machinery and labor-saving devices.

—The Rider & Kitchener Company, Limited, of Lindsay, Ont., has been incorporated, with capital of $100,000, to deal in lumber, veneer, excelsior, etc.

—It is reported that John E. Moore and William Rivers, of St. John, N. B., contemplate rebuilding the Barnhill mill at Pleasant Point, near that city.

—It is understood that some Quebec parties are forming a company to build a saw mill between St. Julie and Somerset, Que., on the line of the G.T.R.

—A. Gareau, of Pembroke, Ont., is offering for sale valuable timber limits on Trout Lake, Que., containing 3,000 acres, timbered with pine, spruce and hardwoods.

—Frederick McIntyre lost an arm in Chisholm Bros.' mills at Belleville, Ont., and has entered action for $5,000 damages, alleging negligence on the part of defendants.

—As a result of the Canadian exhibit of railway ties at the Paris Exposition, a considerable trade in that line between this country and the continent is likely to spring up.

—During the past year the William Cane Manufacturing Company shipped from Penetanguishene, Ont., to their mills at Newmarket, upwards of 700 carloads of saw logs.

—S. C. Wiggins is building a saw mill at Meductic, N.B., which will be equipped with shingle and lath machines also. He expects to have it completed early in the new year.

—Laurie Bros., of Parry Sound, Ont., are building a large shingle mill on the shore of Owl Lake, on the line of the Canadian Atlantic railway, about twelve miles from Parry Sound.

—W. R. Thompson, of Teeswater, Ont., has purchased 80 acres of timber land in Bruce county, and purposes putting up a mill for the manufacture of maple rollers for the British market.

—William Stuckey, of Grand Valley, Ont., has selected a site at Day Mills, Algoma, on which he will erect a large sash and door factory, planing mill and shingle mill, and will manufacture all kinds of building material.

—The ratepayers of Penetanguishene, Ont., will vote on a by-law on January 7th to grant a bonus of $25,000 to the Firstbrook Box Company, of Toronto, for the construction of a box and box shook factory in that town.

—A report from Victoria, B.C., states that the Chemainus Lumber & Manufacturing Company have purchased the Discovery mill from the Bank of British Columbia, and that it is the intention to overhaul the plant and operate the mill.

—A meeting for the advancement of the interests of forestry will be held in the Canadian Institute, Richmond street, Toronto, on Saturday evening, January 12, under the auspices of the Institute and the Canadian Forestry Association.

—The firm of Blue, Fisher & Deschamps, of Rossland, B. C., is now engaged in the erection of a saw mill on Rock Creek. The mill will be 150 x 40 feet, besides dry kilns, planing mill, etc., and will have a capacity of 25,000 feet per day.

—A new lumber concern is the Theo. A. Burrows Lumber Company, Limited, of Dauphin, Man. It is composed of T. A. Burrows, M.P.P., J. E. Hedderley, and William J. Osborne, of Dauphin, H. E. Crawford, of Winnipeg, and I. Cockburn, of Winnipeg.

—The Canadian Pacific Lumber Company, of Port Moody, B.C., have for some years been conducting a lumber yard in Vancouver, with Mr. McLennan as manager. This property has been purchased within the past month by E. H. Heaps & Company.

—At the annual meeting of the Fredericton Boom Company, held at Fredericton recently, changes in the directorate included the election of G. B. Dunn to replace the late E. G. Dunn, and A. H. F. Randolph to succeed the late Charles F. Woodman.

—The Chambre de Commerce, Montreal, has received a letter from Nicholls & Notman, of Durban, South Africa, calling attention to the fact that it would be advantageous to export Canadian lumber to South Africa, and that there is a good market there for it.

—The Rat Portage Lumber Company have completed their new office building in Winnipeg, and J. M. Chrisholm has been installed as manager. It is the intention to commence the erection of sheds at once, which, it is said, will be the largest in the province.

—The Northern Pacific Railway has made a rate of forty cents per 100 pounds on fir lumber from the state of Washington to Manitoba. A few shipments have been made to that province of late years, and it is expected that the reduction in rates will further stimulate trade.

—Some thirty carloads of timber to be used in the construction of the bridge over the St. Lawrence river at Quebec have recently been received from Savannah. The claim is made by the contractor that the southern timber can be obtained at a lower cost than for a suitable grade of Canadian lumber.

—The Anderson Furniture Company, who recently acquired 20,000 acres of good timber land in the Muskoka district, have removed their sawmill from Woodstock to a convenient site in that district. They are this winter taking out a considerable quantity of logs to be manufactured into lumber for furniture purposes.

—Reference is thus made in a British timber journal to a shipment of lumber from New Brunswick to Grimsby: "A noticeable feature of the imports is a cargo of red pine from Miramichi, discharging for Bennetts & Co., a commodity which does not often find its way to this port. We understand two or three cargoes of these red pines have been diverted from London, owing to the block there, and have been sent to various ports around the coast."

—Extensive logging operations are in progress in the vicinity of Elgin, Albert county, N. B. Manning Caldicott will cut over 1,000,000 feet, with his new mill at Church Hill. Other operators are Thaddeus Graves at Gibson Brook, Steeves & Company at Mapleton, and S. R. White & Company on Pollet river. Jacob Steeves, jr., and Benjamin Colpitts, each with a crew of thirty men, have gone to Nova Scotia to log there, the former in Halifax county and the latter in Colchester.

—The last of the exploration parties sent out by the Ontario Government into New Ontario has returned. Their investigations seem to show that the northern portion of the province is much richer in arable, mineral and timber lands than was at first supposed, and it has been estimated that there is spruce sufficient to supply the world for many years to come. Taking only one section of the country, that north of the height of land, explored by a single party, it reveals the existence of nearly 3,000,000 acres of land suitable for agriculture and well timbered with spruce.

—James I. Harris has just completed a modern circular saw mill at Day Mills, Algoma, to be operated by water power. The machinery was supplied by the Waterous Engine Company, of Brantford, and includes a four block Sterns rope feed carriage, double edger, trimmer, cut-off saw, live rolls, and other equipment necessary for an up-to-date mill. Its dimensions are 100 x 34 feet. The water wheel is a 50 inch Canadian turbine manufactured and installed by C. Barber, of Meaford, Ont. With six men this mill will turn out 25,000 feet of hemlock lumber in ten hours.

—The Victoria Lumber & Manufacturing Company, of Victoria, B. C., are about to commence extensive improvements to their large saw mill at Chemainus. The manager, E. G. Palmer, states that it is proposed to erect three dry kilns with a capacity of 20,000 feet each, to install planing mill machinery and a shingle mill plant, and to build three large storage warehouses. The old stables stores, hotel, and other buildings will be removed so as to increase the wharf accommodiation, and a slip will be constructed for the transfer barn. A railway spur will also be built into Horseshoe Bay connecting the mills with the E. & N. railway system. A rough estimate of the cost of the improvements is $100,000.

NEW COOPERAGE MILL.

At Castleford, Ont., which is situated about eight miles from Renfrew, the Southerland Innes Company, of Chatham, have commenced the construction of a plant for the manufacture of cooperage stock. This company is the largest cooperage concern in the world, operating no less than fifty-seven plants. The mill in question will consist of a boiler house, with 230 h.p. capacity in boilers; saw mill and hoop works, driven by a 75 h.p. engine; stave and heading department, with 100 h.p. boiler capacity; dry kiln 18 x 125 feet, heated by a Buffalo blast fan; steam box building containing eleven compartments, wherein all material for staves is steamed and cut while hot; blacksmith shop, fitted with all the necessary appliances for repairing machinery; store shed 26 x 300 feet; and two stave sheds 26 x 300 feet each.

The capacity of the stave department will be 40,000 daily, the sawmill 20,000 feet of lumber, the heading room 3,000 sets per day and the hoop works 50,000 per day. The annual consumption of lumber will be upwards of 3,000,000 feet, and employment will be given to about 50 men. A branch line of railway will be constructed from the main line to the mill.

WOOD PULP DEPARTMENT

WET AND DRY PULP.

By W. A. Hare.

In preparing mechanical pulp for export in nearly every mill in Canada and the States, the percentage of 50 per cent. pulp to 50 per cent. water seems to be considered the standard of dryness. Why this limit has been adopted is not generally known, for the simple reason that it is non-existant. By present methods this percentage is about the limit, and instead of changing the methods the owners of mills seem to have been content to lose thousands of dollars annually by exporting water. That pulp can be cheaply and easily made, containing not more than 5 to 10 per cent. water by weight, has been already proved by at least one mill in Canada, and there is no reason why nine out of every ten mills should not be equipped in this way.

When pulp is supplied to the wet machine it is less than 1 per cent. by weight of the water in which it is carried. This is as it should be, because the solution of water and pulp is easy to handle by means of centrifugal or plunger pumps When it is delivered by the ordinary wet machine in the form of a sheet, the pulp will comprise from 35 to 45 per cent. of the total weight, the remainder being water. In many mills where poper making is carried on as well, the presence of water in the pulp is practically of no consequence ; in fact in many cases it is considered a decided advantage, as the pulp and water can be pumped directly to the paper mill, thereby entirely doing away with the wet machine. In other places the pulp is delivered to the paper mill in the form of a sheet with a percentage of 25 to 35 per cent. pulp. The presence of water in the pulp in this case enables the sheet to be more easily reduced to a solution again. In the case of a mill which manufactures for export, however, the conditions are entirely different. Freight is paid per hundred pounds, and is the same if you ship water or pulp. When pulp is shipped at 50 per cent. the transportation charges are double what they should be. As this item in any case would not be by any means a small one, the effect of doubling it is apparent. This will explain the reason why some United States pulp mills can import their wood sawn and barked instead of moving the mills to the forests and railing their pulp to the paper mill. Air dried spruce can be more cheaply transported than the same quantity when manufactured into pulp at 50 per cent. dry.

The usual method of increasing the percentage of pulp from 35 or 40 per cent. as deliverd by the ordinary wet machine to 50 or 55 per cent. for export, is by means of hydraulic presses. The method is briefly as follows: On the platen of the press are placed thick felts or bagging, then folded sheets of pulp, then more bags or felt, and more pulp, and so on until the press is full. On applying the pressure the water is pressed out and runs down the outside. After sufficient pressing the platen is lowered and the pulp and bags removed. In nearly every case the pulp will vary in dryness according the position it occupied in the press, that which was near the edge being very wet, while the interior is fairly uniform. By folding the sheets as is done in some mills, a great deal of water is retained. When the pulp is under pressure it is saturated with water, but as it is occupying a much smaller space some water is driven off, nevertheless there is considerable water still in the pulp and bagging and between the sheets of pulp. If the pressure be now removed the pulp will expand and soak up this water again. The result is that to produce 50 per cent. pulp we are required to produce a higher percentage when in the press which we get no return for.

It is quite evident, then, that we cannot obtain dry pulp by this method unless we greatly reduce the capacity of our presses by using higher pressures and allowing more time for pressing. In any case, the limit of the hydraulic press would probably be in the neighborhood of 70%, which, according to our new standard, is still wet pulp. The question has been raised by some paper-makers as to the advisability of making dry pulp As it has to be all reduced to a solution again the paper-maker would rather get his pulp wet so it can be easily beaten up. The problem then, is to produce a pulp at least 95% or 97% dry, and put up in such a form that there will be no difficulty experienced in reducing it again to a solution by mixing with water and beating when it has arrived at the paper mill.

It is claimed by some makers that their wet machines will produce 50% pulp directly from the rolls, but in nearly every case the capacity will have to be reduced to obtain this percentage the machine being run slower to allow the water to escape.

There are a number of mills that find the transportation charges so high that they are practically prevented from exporting. If they would put in machinery capable of producing dry pulp they would be able to market their product twice as far from the mill as at present with a correspondingly enlarged market, and with greater opportunities to avail themselves of changes in foreign prices.

One of the chief sources of difficulty with Canadian pulp in the English market is the variation in the moisture test, and therefore some ambiguity as to the exact weight of pulp shipped, leaving the way open for disagreement between purchaser and shipper. All this could be avoided if a standard of 95% or 99% were adopted—preferably the latter ; but in this case great care must be taken in shipping to prevent water or moisture getting at the pulp, as it will absorb 10% to 15% from the air, reducing it to 90% or 85% dry. This does not present any great difficulty, as with the amount gained in the reduction of the freight charges, more could be expended in securing an efficient and cheap wrapper for the bundles, thereby ensuring the arrival of the pulp in a perfectly dry and clean condition, which would at once claim an advance in price over the product shipped under present methods.

There is talk of the Rathbun Company, of Deseronto Ont., building a pulp mill at Bancroft.

William Lancaster, a prominent paper manufacturer, of England, recently made a tour through the spruce districts of the Dominion. Mr. Lancaster expressed himself as being highly pleased with what he seen particularly in the province of Quebec. Formerly his supply or pulp has been obtained from Holland and Norway, but he expected to close contracts for a considerable quantity of Canadian pulp.

COTTON-SEED HULL PAPER.

N American is said to have discovered ocess for treating cotton-seed hulls so the fibre attached may be utilized for er making, and a company has been hed for testing the process experiment- . Regarding the system an exchange arks that it is doubtful whether it is pos- le to so destroy the hulls, either me- nically or chemically, as to make the e suitable for printing papers. The cessful resolving of cotton-seed hulls uld be a matter of great importance to pulp and paper industry. There is an mense quantity of cotton-seeds produced ually, and attached to these seeds e is a considerable quantity of valuable e. Hitherto they have been crushed the extraction of oil, but their value in direction would not presumably be ected by their use in paper making, as the shed seeds would be quite as valuable, ot more so, for the paper maker. The ds are also very largely used—especial- in India—for cattle-feeding purposes, l of course there are large quantities of cake used in England made from them, hough linseed is also used for this pur- se. The Egyptian seed, however, is the instay of this trade, as it is larger and s less fibre attached than the American Indian. The result of the experiments out to be tried in the United States will looked forward to eagerly.

It has been announced that the Carnegie eel Company will ship steel by an all ter route from Lake Erie ports to Europe the St. Lawrence route. As the ves- ls cannot be loaded to their full capacity til the locks are passed, it is expected at they will complete their cargo at ontreal, taking on considerable pulp.

PULP NOTES.

The Waterous Engine Works, of Brantford, Ont., have already secured orders for $40,000 worth of pulp making machinery.

It is again stated that McKenzie & Mann, railway contractors, have decided to erect large pulp mills at Fort Frances, Ont., next summer.

It is said that the Canadian Electric Light Co., of Quebec, have completed arrangements for the construction of a large pulp mill at Chaudiere Falls.

It is reported that Mr. W. J. Hill, M.P. P., of Toronto, has secured the contract for building a large pulp mill at Shawinigan Falls, Que., for Belgian capitalists.

Mr. H. G. Fuller, of Portland, Me., is negotiating with parties in Canada in regard to establishing a plant for the manufacture of felts used in paper and pulp mills.

Eastern capitalists are proceeding with arrangements for the establishment of the proposed pulp mill in British Columbia. The mill will be tributary to Vancouver, the site chosen being but a few miles from that city.

The company which proposes to build a pulp mill at Musquash, N.B., will shortly apply for incorporation. The capital stock will be $100,000. Geo. McAvity, H. R. McLellan, Geo. W. Jones and F. Stetson, of St. John, are interested.

The town of Woodstock, N.B., wants a pulp mill, and has offered a bonus of ten per cent. of the cost of the mill, the bonus not to exceed $50,000. Mr. Henry Upham, of that town, has decided to donate a suitable site for a mill.

Mr. Thomas Malcolm, contractor for the building of the Restigouche and Western railway in New Brunswick, states that he has received propositions from capitalists who purpose erecting pulp mills along the railway as soon as it is completed.

Chas. Lionais, civil engineer of Montreal, recently sold an iron pyrites mine at Garthby, Que., to a New York syndicate who have in view the erection of a sulphur factory at Levis. It is proposed to use the sulphur for the manufacture of pulp.

About three years ago Randolph & Baker, of St. John, N. B., discovered magnesia lime in the lime rock about their quarry. Recently they have commenced to burn it and have shipped large quantities to the United States for use in pulp mill digestors.

Sweden has 88 mechanical pulp mills, producing yearly 144,000 tons, dry weight, of pulp. She also produces 125,000 tons of sulphite, and 38,000 tons of soda pulp. Norway has 61 mechanical pulp mills, with an annual output of 180,000 tons of soda pulp. The total production is, therefore :

	Dry tons.
Mechanical pulp.....	324,000
Sulphite.....	212,000
Soda.....	46,000

Reporting on the wood pulp market in France, M. A. L. Grondal, of Paris, states that prices of chemical wood pulp are wel maintained. Considerable activity has been experienced in the renewal of contracts for 1901, and at the moment nearly all important buyers are covered. In regard to mechanical wood pulp prices remain high, especially for delivery during the winter months. The demand, however, is insignificant, and consumers who have not contracted for next year show a disposition to await future events.

A West Hartlepool correspondent of the Timber Trades Journal thus refers to a shipment of Canadian pulp : "We have just received 1,971 bales Canadian sulphide wood pulp per steamer via Liverpool for local consumption, which we believe is the first lot we have had, hitherto it having come from West Hartlepool. The bales, we notice, are very compact, and well bound with hoop steel, and as our cousins, the Canadians, are evidently pushing this article in England, this new departure may mark an epoch in the pulp trade, as the supply of whitewood in Canada is pratically unlimited. Baltic exporters take note ! The shippers are Becker & Co., London, and the shipping agent here is Mr. Andrew Farmer.

CANADIAN FORESTRY ASSOCIATION.

The Canadian Forestry Association has been in existence for less than a year, but already it has made sufficient progress to demonstrate that its success is assured. It now has a good representative membership in every province in the Dominion, and new additions are steadily being made to the list.

Owing to the attention of the public being taken up by other important matters during the present year, the Association has been doing its work quietly, but the report of the first annual meeting has been widely distributed and the foundations of a strong movement have been laid. More active steps will, however, be taken during the coming year, and it is expected that meetings in the interests of the Association will be held at a number of important points. A conference has been arranged for at Toronto on the 5th inst. and following that will be the second annual meeting at Ottawa in the early part of March. The arrangements for the annual meeting were under discussion by the Executive Committee of the Association at a meeting held at Ottawa on December 7th. It is intended to have papers read representing the forestry interests of all the provinces of Canada as far as possible, and it is also hoped to obtain the services of Mr. Gifford Pinchot, Chief Forester of the United States, for an evening lecture.

CUBA NOT WELL WOODED.

JOHN Gifford, the founder of the Forester, who recently journeyed across Cuba from Cienfuegos to Havana, says it is not a well wooded island, notwithstanding many printed statements to the contrary. The marketable lumber is being cut so rapidly that in a few years it will be extirpated. Considerable quantities of mahogany, cedar and lignum vitæ have been shipped from Cuba in the past, and the large number of structures on the island containing mahogany shows that it must formerly have been much more plentiful than it is now. Both the mahogany and cedar trees are far apart and are becoming rarer every year, so that Mr. Gifford predicts their disappearance in a short time. In the mountains lignum vitæ is still abundant, and is exported largely, being used for pulleys, blocks, croquet mallets and balls and many other purposes. In the forests of Western Cuba the Cuban pine is abundant and is much used for timber. The finest tree of Cuba is the royal palm, which grows in fields and plantations and along water courses, without which the Cuban would be hard put to it for building material. It is not a very ornamental wood, but it is peculiarly fitted for building purposes, as it has the valuable quality of shutting out the heat, and houses built of it are cool. The nuts of the tree are good food for swine. The mango is rather common and its fruit is very popular with the natives, who eat it so inordinately that "mango belly" is a recognized ailment all over the island—not dangerous but unsightly, as it causes a remarkable and ridiculous distention of the abdomen, particularly in children. The mango is a splendid shade tree. Another magnificent shade tree is the ceiba or silk cotton but it is worthless in any other sense, as the wood is too soft for use. The great ceiba tree under which the surrender of the Spanish commander was received near San Juan Hill, Mr. Gifford notes, has been so chipped and hacked by souvenir vandals that there was danger of its being destroyed, and now a barbed wire fence protects it. In the cities the common shade trees are the Spanish laurel; the beefwood, Ficus Indica, which is the sacred Bo tree of India, and is something like a poplar, though not so tall and majestically erect; the West India almond, which is not an almond at all, and the sandbox tree, which has the peculiar trait of exploding its fruit with a sharp report and scattering its seeds far and wide. Because of this the natives call it the monkey dinner bell, as they say that at the sound of the report the monkeys rush in from all sides to eat the delicate seeds.

NEW MARKET FOR TIMBER IN GREECE.

THE American consul at Athens writes to his department that "owing to the tariff troubles between Turkey and Greece, the Greek importers of timber are considering the question of importing from some other country the large quantities of timber, lumber, staves, etc., which they have heretofore annually brought from Turkey, and I think it well to inform American exports of this fact that they may have a chance to make a bid for the custom of the Greek market. As Greece does not produce any timber for manufacturing purposes, and very little for any use, she is obliged to import nearly all she consumes. In 1898, the latest year for which Greek import statistics have been published, Greece imported woods for building and manufacturing purposes valued at 7,709,746 francs ($1,511,710.98) from Austria, Turkey, Germany, Roumania, Russia, Italy, France, United States, Belgium and England, these countries furnishing portions of the whole in the order named. Austria and Turkey produced the largest part of all the woods imported, while the United States furnished a few thousand staves for current barrels.

"The demand for woods of all kinds is rapidly increasing in Greece, and the local prices are very high. The great distance will make the freight on timber from the United States much higher than from any other of the countries named; but with a direct line or lines of steamships connecting Greek and American ports, there would be a good chance to open up the Greek market for our native timbers—a market in which the demand for good qualities will annually increase."

PERSONAL.

Mr. Joseph Oliver, president of the Oliver Lumber Company, Toronto, is a candidate for aldermanic honors in Ward No. 2, with good prospects of success.

Mr. Lewis A. Grant, of the British & North American Timber Company, of London, Eng., is at present visiting United States and Canada for business purposes.

Mr. C. A. McCool, the well known lumberman, of Geneva Lake, Ont., was on November 28th elected by acclamation as the member of the Dominion Parliament for Nipissing district.

Hon. R. R. Dobell, lumber dealer, of Quebec, is now on his annual visit to England. Mr. H. R. Goodday, of Quebec, and his son, Mr. H. G. Goodday, are also on a business trip across the Atlantic.

Mr. David Whitney, president of the Skillings, Whitney & Barnes Lumber Company, of Boston and Ogdensburg, died last month at his home in Detroit. Mr. Whitney was the founder of the present business.

The death occurred in Ottawa on December 26th of Mrs. John Chitty, mother of Mr. Charles Chitty, of Chitty & Johnston, an employment firm well known in lumber circles. The deceased lady was one of the oldest of the Capital, being 97 years of age.

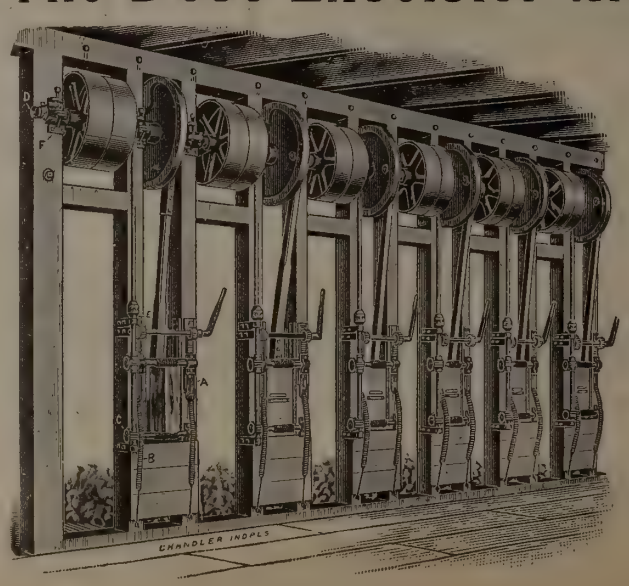
Mr. Charles Grant died on December 11th at his home in the township of Elizabethtown, ner Ottawa. Many years of his early life were devoted to railroad contracting, while he also engaged extensively in lumbering in the Ottawa district. For the past twenty years he followed the life of a farmer.

Lieut. W. T. Lawless, a popular employee of the Upper Ottawa Improvement Co., who was second in command of the Ottawa company first contingent, returned to the Capital on Christmas day. He was given an enthusiastic reception. During his year's absence in South Africa Lieut. Lawless was continued by the well known lumber concern on half pay. His position was also kept open for him.

Mr. E. Stewart, chief inspector of timber and forestry for the Dominion, was in attendance at the recent annual meeting of the American Forestry Association at Washington. Mr. Stewart looked carefully into the working of the plan adopted by the Division of Foresty of the United States for the encouragement of tree planting, it being the intention of the Department of Interior to apply a similar plan to portions of Manitoba and the North-west Territories. Mr. Stewart proposes to hold a number of meeting in the prairie sections of Manitoba and the Territories for the purpose of laying the plan before the people and asking their co-operation in carrying it out.

The machinery firm of Carrier, Lane & Company, Levis, Que., was dissolved recently, and a new partnership registered under the same style, with Messrs. C. H. Carrier and J. E. Roy as proprietors.

The Best Excelsior Machine in the World



When two or more knives are run with one belt, all must stop when the belt is stopped to set bits or from any other cause. Our Machine has a belt for each knife, hence but one knife stops at a time. This great advantage should not be overlooked by purchasers. Time is money. Our Machine cuts more excelsior in a given time than any other machine. Get our circulars and prices.

INDIANAPOLIS, IND.

FORESTRY FOR PROFIT.

Mr. James Ballantyne, of Ottawa East, recently cut into cordwood a soft maple tree which grew from a seed planted by himself in 1874. The seed came from Hurdman's Bridge, and when the tree was a few feet high it was transplanted for the sake of room. In 26 years it grew to be 18 inches in diameter at the base and yielded a cord of wood without reckoning the small branches. Mr. Ballantyne says that an acre will grow 40 such trees, and he draws the conclusion that the forest growth of Canada is such as to insure us forever against a wood famine. The results of another calculation of his is that 40 cords of wood at three dollars per cord gives an annual rent of $4.50 per acre, which is not below consideration.

It is reported that the extensive lumber firm of C. K. Eddy & Sons, of Saginaw, Mich., are considering the removal of their saw mill to the Georgian Bay district, where they own about 200,000,000 feet of timber.

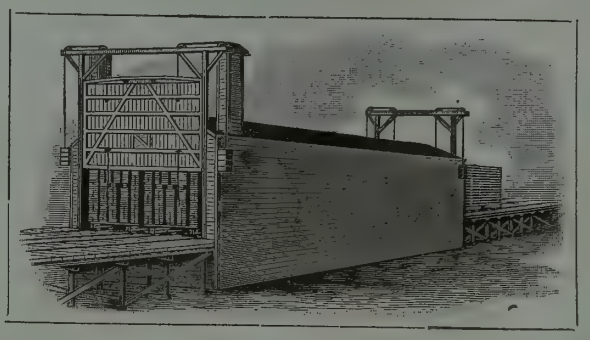
THE DRY KILN THAT DOES NOT Disappoint



THE DRY KILN THAT DOES NOT Disappoint

THE DRY KILN THAT DOES NOT Disappoint

THE DRY KILN THAT DOES NOT Disappoint

The Standard Seemed the Most Common Sense Dryer, and We Made No Mistake in Our Choice.

BRANTFORD, Ont., April 4, 1900.

THE STANDARD DRY KILN CO., Indianapolis, Ind.

GENTLEMEN:—Having had for the last twenty years considerable experience with Dry Kilns—Hot Blast and others—without getting the desired results, last spring there being no dry lumber to be had, especially in hardwoods, this compelled us to take up the question of more drying capacity. After very careful consideration The Standard seemed the most common sense dryer in the market, and we are more than pleased to say that we made no mistake in the choice. We have had the best of satisfaction from exhaust steam only, not requiring to use any live steam. If we were adding another kiln, we would certainly put in another of your make. It is a great saving on stock; it comes out in splendid shape. Yours truly,

THE SCHULTZ BROS. CO., Ltd.

THE STANDARD is the highest type of development of the **Moist Air** System of Drying. Hundreds of users in all parts of the world say THE STANDARD has absolutely **no equal.**

This Saw Stands Without a Rival

AND IS THE

FASTEST CUTTING SAW IN THE WORLD!

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

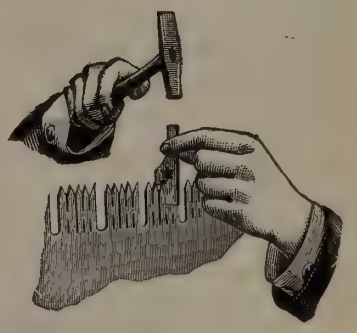
Maple Leaf Saw Set

MANUFACTURED BY

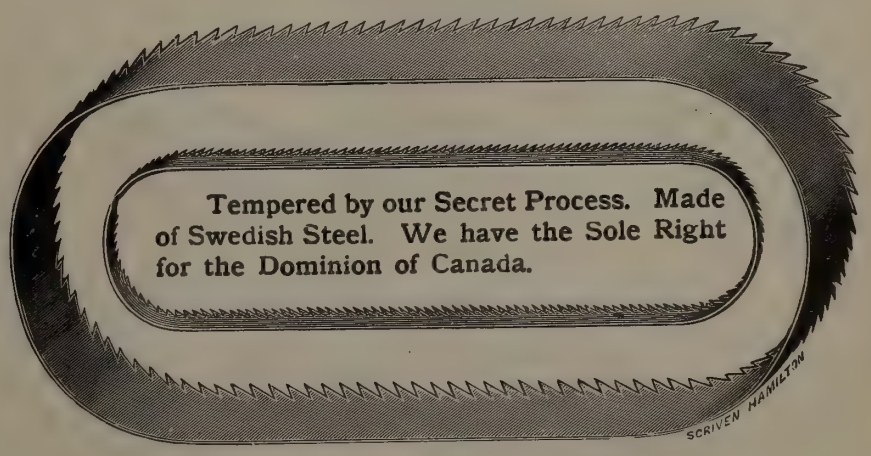
SHURLY & DIETRICH, Galt, Ont.

Directions.—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake. Be sure and not strike too hard a blow, and it will set the hardest saw. **On receipt of 40 cents we will send one by mail.**



We are the only manufacturers in the world who export Saws in large quantities to the United States.



We Manufacture

HIGH GRADE BAND SAWS

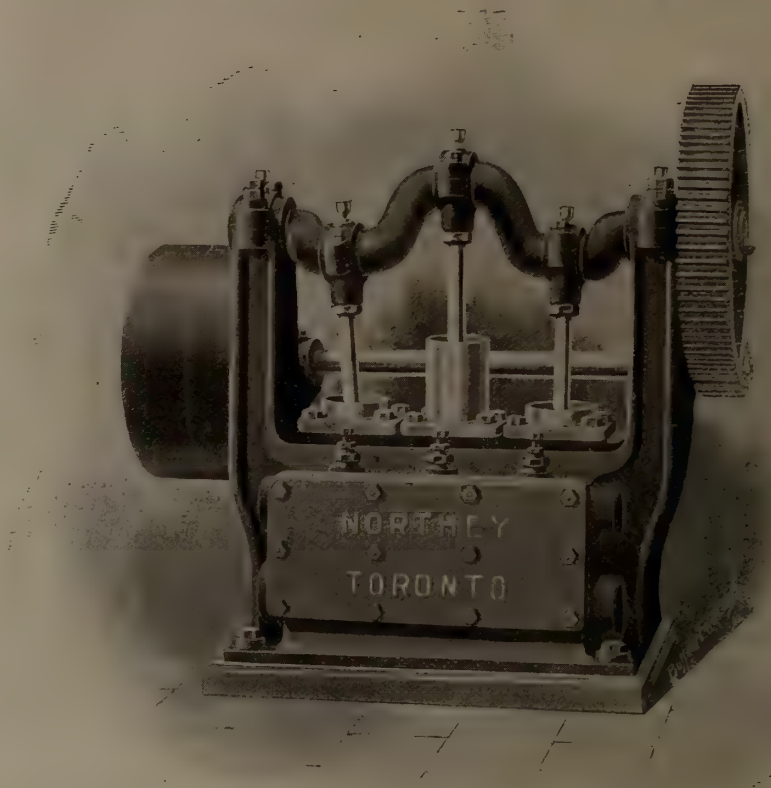
of All Widths and Lengths.

These Saws are made of Refined Swedish Steel imported direct, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

Northey Triplex Power Pump

FOR BOILER FEEDING AND GENERAL PRESSURE PURPOSES

In the Northey Triplex Power Pump we offer a machine put together with the skill brought by years of experience in pump building, and with full provision made for the varied demands likely to be made upon a pump of this character. A feature of value is that the three cranks are placed 120 degrees apart, thus giving a practically constant flow of water—minimizing strain on pump and economizing power. The pump can be readily repacked and taken up, and all details are carefully worked out. It can be conveniently operated by electricity, by water power, or by belt from engine. Different styles and sizes made to suit all duties.



WE ARE MANUFACTURERS OF OVER FIVE HUNDRED DIFFERENT STYLES AND VARIETIES OF STEAM AND POWER PUMPS FOR STATIONARY AND MARINE PURPOSES. WE INVITE ENQUIRIES FROM ENGINEERS, MINE SUPERINTENDENTS AND OTHERS FOR THEIR REQUIREMENTS IN OUR LINE. CATALOGUES AND SPECIFICATIONS FURNISHED UPON REQUEST.

We are also manufacturers of the Northey Gas and Gasoline Engine which has proved to be the handiest and most convenient power for small or intermittent power users in the market. Suitable for machine shops, pumping and electric light plants, etc. Write for illustrated descriptive booklet.

THE LUMBER TRADE OF 1900

Tables Showing the Shipments from the Different Provinces.—Year of Satisfactory Progress.—High Freight Rates the Feature of Export Business.

FOLLOWING our usual custom, a review of the lumber trade of the year 1900 is presented in this issue. By means of the data given, the extent of the lumber industry of the Dominion may be estimated, while the tables are of particular value as showing comparisons with previous years. Some advancement was made by the lumber industry during the year. The volume of home consumption was as large as in the previous year, while the exports to foreign countries show a slight increase. The shipments of lumber from British Columbia were 30,000,000 feet greater than in 1899, those of New Brunswick 70,000,000 feet greater, and of Nova Scotia 20,000,000 feet greater. From the province of Quebec the exports were slightly less, and although statistics covering the province of Ontario are not available, it is believed that the shipments were about the same as in the previous year.

The output of lumber during the year exceeded the production of 1899, and at the close of the season manufacturers and dealers held slightly larger stocks. The Presidential election in the United States was a disturbing factor, causing a falling off in the demand from that country.

Prices ruled firm throughout the greater part of the year, although towards the close there was a slight depreciation in the price of hardwoods. The figures at which lumber was sold, however, show that there is a growing appreciation of lumber values, consequent upon the decreased timber supply. This is especially true in respect to hardwoods, of which the supply has become greatly diminished.

Excessive freight and insurance rates and a scarcity of tonnage from both the Pacific and Atlantic coasts were features of the export trade. Vessel charters were effected at the highest rates on record, 62 shillings 6 pence being paid from Montreal to London. Early in the year the export demand was very brisk, but towards the close the British market became somewhat depressed. The stock of export lumber held over at shipping ports is greater than at the close of the previous year.

ONTARIO.

When the mills in Ontario commenced operations last spring, the stock of unsold lumber held by dealers and manufacturers had been reduced to very small proportions. The active demand which characterized the trade of 1899 continued during the first half of last year, with lumber prices generally quite as high, and in some instances higher. The probability of a weaker market as midsummer was approached was removed by the fire in the lumber district of Ottawa which occurred in April, and by which over 150,000,000 feet of lumber, chiefly pine, was destroyed and thus taken out of the market. While more directly affecting the Ottawa district, the result of the fire was to cause manufacturer throughout the province to hold prices firmly, as it became evident that all the lumber manufactured was likely to be required for local and export purposes. Sales of the most active grades of pine lumber were made at prices about one dollar per thousand higher than in 1899, and although some stocks were allowed to accumulate at the mills towards fall, there was no depreciation of values, and the year on the whole was characterized by high prices, especially for white and red pine. The Presidential election in the United States was the cause of a temporary cessation in the demand from that quarter. Larger shipments were made from the Georgian Bay district to Michigan than ever before.

The quantity of lumber manufactured was equal to, if not greater, than in 1899. Many of the Georgian Bay mills were employed in sawing for firms which had in previous years rafted their logs to Michigan to be manufactured. The Ottawa Valley production of pine was slightly increased. While prices during the year were high, it is understood that the profits of lumbermen were no greater than in the previous year. This is due to the increased cost of production, brought about by the higher cost of labor and supplies and by high freights and insurance in transporation.

The early part of last year was phenomenal in the remarkable demand for hardwoods of all kinds. Prices were then the highest that have been known for years. Later in the season this demand fell away. Many of the hardwood lumbermen did not avail themselves of their early opportunities to sell, and consequently the stocks at the close of the year were rather heavy. In the winter of 1899-1900 extreme prices were paid for hardwood logs, so that it was necessary to hold lumber for high figures. Beech lumber came into unusual demand during the year in some localities. There was also a greater use of hemlock, which sold at $9 per thousand at mills in western Ontario.

The shingle market did not seem to gain in strength in common with lumber. The white pine variety encountered severe competition from red cedars.

Lath was in fair demand, but the high price of $3.75 for No. 1 white pine which ruled in the fall of 1899 did not hold. Towards the close of the year there was greater firmness.

On a conservative estimate the cut of the Ottawa and Ottawa Valley mills for 1900 will total 588,000,000 feet. This is an increase of 56,000,000 feet over the cut of 1899. This may seem surprising, in view of the fact that fire played havoc with the Ottawa lumber interests. The Hull Lumber Co.'s mill was completely destroyed, but this company had the use of the Mason and Bronson & Weston mills at Ottawa and an Aylmer mill, the combined cut of which was greater than that in 1899 at the old mill. The Booth mill at the Chaudiere was only interfered with early in the season by the fire, though the standing supply of lumber was wiped out. As the mill was worked day and night till late in the season the cut was large. Gillies Bros., Braeside, also had a large cut at their mill, amounting to 30,000,000 feet. The cut at the other mills was about the same as in the past year. The Ottawa Valley production for two years is given below :

OTTAWA VALLEY PRODUCTION.

	1899—Feet	1900—Feet.
J. R. Booth, Ottawa	125,000,000	125,000,000
Gilmour & Co., Trenton	25,000,000	25,000,000
Hull Lumber Co., Hull	25,000,000	35,000,000
McLachlin Bros., Arnprior	65,000,000	70,000,000
Hawkesbury Lumber Co., Hawkesbury	50,000,000	45,000,000
W. C. Edwards & Co., Rockland and New Edinburgh	70,000,000	85,000,000
St. Anthony Lumber Company, Whitney	43,000,000	42,000,000
Gillies Bros., Braeside	13,000,000	30,000,000
Gilmour & Hughson, Hull	30,000,000	35,000,000
R. & W. Conroy, Deschenes Mills	3,000,000	.....
Pembroke Lumber Co., Pembroke	11,000,000	14,000,000
Ottawa Lumber Co., Calumet	10,000,000	8,000,000
Ross Bros., Buckingham	10,000,000	10,000,000
McLaren Estate, Buckingham	16,000,000	15,000,000
J. R. & J. Gillies, Arnprior	3,000,000	3,000,000
A. Hagar & Co., Plantaganet	6,000,000	6,000,000

Bailey Bros., Aylmer	8,000,000	4,000,000
McLaren & McLaurin, East Templeton	10,0000,00	6,000,000
G. H. Perley Co., Calumet	.....	25,000,000
Total	532,000,000	588,000,000

QUEBEC.

Nearly every lumber manufacturer in Quebec catering to the local and United States markets reports a very satisfactory year's business. Particularly in the early months in the year was there an active demand from the United States, and as stocks became scarce prices were advanced. One manufacturer writes that the average prices of spruce and hemlock lumber were three dollars higher than in 1899. There was also an increased demand for hardwoods, and the season closed with stocks of lumber suitable for the United States market practically cleaned up. The higher prices offered by shippers to the United States was an inducement

to manufacturers to cut for that market rather than for Great Britain, and consequently the shipments to the latter country show a considerable falling off. Another drawback to the British trade was the high freight and insurance rates from the St. Lawrence. Owing to the Ottawa fire only about 40 per cent. of the shipments from the port of Montreal came under summer insurance rates, while 60 per cent. were under extreme autumn rates. The opening spring rates of freight ranged from 45 to 50 shillings, according to port of destination; summer and autumn rates ranged 60 shillings and upwards, as high as 75 shillings having been paid for special ports.

The trans-Atlantic shimpments from the port of Montreal were approximately 239,000,000 feet, a decrease of 50,000,000 feet as compared with the previous year. The following table shows the respective shipments of the different firms from the port of Montreal for two years :

	1899—Feet.	1900—Feet.
Watson & Todd	52,152,000	55,574,000
Dobell, Beckett & Co	54,852,000	39,429,408
W. & J. Sharples	52,166,308	37,735,855
R. Cox & Co	35,732,949	26,826,629
McArthur Bros	24,368,952	19,302,370
Charlemagne Lumber Co	19,079,315	16,135,965
J. Burstall & Co	26,887,315	14,843,496
Cox, Long & Co	.....	6,643,931
McLaurin Bros	5,385,000	5,214,061
E. H. Lemay	5,934,000	4,339,925
D. Cream	1,268,840	955,526
Harold Kennedy	961,838	613,800
The Robert Reford Co., Ltd.	207,900	524,708
Imperial Lumber Co	.....	289,020
Montreal Lumber Co	.....	228,189
Sundry Shippers	9,876,804	3,328,537
Railways, etc	.....	7,236,960
Total feet	288,826,512	239,222,380

Only one shipment of lumber was made to the River Plate, consisting of 463,765, the shippers being the Export Lumber Company.

From ports east of Montreal, exclusive of Quebec, the following shipments were made :

	Feet.
Dobell, Beckett & Co	97,153,332
W. & J. Sharples	41,601,780
McArthur Bros., Limited	12,946,959
J. Burstall & Co	7,919,143
Price Bros. & Co	60,000,000
King Bros. & Co	25,000,000
Total	159,621,214

This brings the total lumber shipments from Montreal and eastern ports to 484,307,339 feet. The two largest shippers were Dobell, Beckett & Company, with a total 136,582,740 feet, and W. & J. Sharples with 79,337,635 feet.

The returns from the port of Quebec show a considerable falling off in the export of square and waney timber and pine and spruce deals. The annual timber trade circular of J. Bell Forsyth & Company reviews the timber trade of the port of Quebec in the following manner :

WHITE PINE.—Even with the diminished export, which is the lightest on record, the wintering stock has fallen far below that of any previous year since the trade was established. The production will be small in spite of the advanced prices, and the sources of supply seem almost exhausted.

		Supply.	Export.	Stock.
1900	Square	570,818	2,754,920	804,417 Square.
	Waney	1,504,625		506,001 Waney.
1899	Square	592,088	3,085,560	1,147,817 Square.
	Waney	1,793,281		1,014,344 Waney.

RED PINE.—The supply, export and wintering stock all show reduced figures. Canadian red pine deals being in good demand in the markets of the United Kingdom, the manufacture of this wood as timber will be exceedingly light this winter.

	Supply.	Export.	Stock.
1900	63,780	133,640	85,880
1899	159,977	234,240	142,078

OAK.—The export shows some falling off, but the light supply has left a very small stock on hand. The production will be very restricted this winter, and seems likely to cease altogether shortly, unless a very marked advance in price takes place.

	Supply.	Export.	Stock.
1900	488,100	779,040	303,413
1899	607,965	877,320	615,520

ELM.—The marked advance in price has brought out a good supply, but the demand even at the increased figures has been so good as to leave a lighter stock than the moderate figures of last year.

	Supply.	Export.	Stock.
1900	712,468	682,600	65,311
1899	472,889	555,360	100,373

ASH.—This wood continues in good demand at full prices, and although the advance in value has increased the production, the stock is again almost nominal.

	Supply.	Export.	Stock.
1900	91,745	84,880	2,211
1899	58,212	58,360	2,950

BIRCH.—The export has again been large, almost clearing stock. As business in this wood has been very unprofitable, the production will be much reduced.

	Supply.	Export.	Stock.
1900	441,019	371,240	11,486
1899	253,039	328,440	3,331

PINE DEALS.—The advance in value noted last year has been maintained; the Ottawa mill cuttings having been disposed of at similar figures for next season's cut. Prices continue good in the United Kingdom, but the diminished consumption shows a necessity for caution. It must be remembered the following figures are for Quebec only, and represent a very small proportion of the deal trade.

	Supply.	Export.	Stock.
1900	182,367	233,540	15,720
1899	396,000	353,000	66,003

SPRUCE DEALS.—Values have been maintained on this side of the Atlantic, but owing to the large supply of Baltic whitewood, a drop of price from the highest point has taken place in the United Kingdom, and the stock wintering there is greatly in excess of last year.

	Supply.	Export.	Stock.
1900	5,414,171	4,965,468	904,863
1899	5,403,000	6,563,000	516,160

SAWN LUMBER.—Shipments have been almost nil during the past season to the River Platte, that market having been unable to respond to the increased value recommended by the shippers.

FREIGHTS.—Opened for steam at about forty-seven and sixpence for deals for Montreal liners, and steadily advanced, owing to the scarcity of tonnage, to seventy shillings. For steamers for Quebec timber cargoes eighty shillings for timber and fifty-five shillings for deals was paid in the spring. For sailing vessels loaded at Quebec, twenty-five shillings per load was paid for the Clyde in June.

It is interesting to compare current prices for timber with those ruling five years ago. The advance in the price of square pine timber is shown to have been about six cents per cubic foot, that in waney pine about four cents, red pine eight cents, ash six cents, while in elm the advance had been fully fifteen cents per foot. Oak, birch and tamarac are selling at about the same figures as five years ago.

THE MARITIME PROVINCES.

Manufacturers of lumber in New Brunswick and Nova Scotia disposed of the greater portion of their product at very satisfactory prices, as early in the year there was a very active demand for stock for shipment to Great Britain and the United States. Spruce deals which in 1899 sold at $10 per thousand were freely contracted for in the early spring of last year at an advance of one dollar over this price, while South American specifications were taken at $11.50. While prices of deals were higher, the margin of profit was no greater, owing to the increased cost of production and higher ocean freights. The shipments to the United States, while active early in the year, decreased in the fall, and the total from the port of St. John shows a decline in value of $347,048.59. Clapboards were a drug upon the market, and such sales as were made were mostly of an unprofitable character. The cedar shingle market was also depressed, the average selling price being 25 to 50 cents lower than in 1899.

The trans-Atlantic shipments from the Maritime provinces were of large volume. From New Brunswick they reached 489,000,000 feet, which is within 5,000,000 feet of the largest export on record, that in the year 1897. The exports were chiefly to Great Britain; France and Spain took about 9,000,000 feet each; Australia, 6,000,000 feet; and Italy a little over 1,000,000 feet.

Although accurate statistics are not available, it is believed that a fair estimate of the lumber exports from Nova Scotia would be 200,000,000 feet. The shipments to trans-Atlantic ports have been given as 146,000,000 feet, showing an increase of 18,000,000 over the previous year. Probably 20,000,000 feet was shipped to South America and about 10,000,000 feet to Cuba and the West Indies. The principal shippers to South America were E. D. Davidson & Sons, of Bridgewater; Dickie & McGrath, of Tusket; Parker, Eakins & Co., of Yarmouth; Blackadar Bros., of Yarmouth; S. P. Benjamin, of Wolfville; Alfred Dickie, of Lower Stewiacke; and I. T. Freeman, of Jordan River.

Below is given a table showing a comparative statement of lumber shipped from St. John to the United States in the years 1899 and 1900, a division being made in the lumber manufactured from New Brunswick logs and that from Maine logs :

EXPORTS OF ST. JOHN TO U.S.—1899.

NEW BRUNSWICK LUMBER.

	First Half Year.	Sec nd Half Year.	Total.
Long lumber	$32,935.43	$65,075.88	$98,011.31
Laths	28,561.72	66,095.94	94,657.66
Shingles	23,283.75	41,957.87	65,241.62
Piling	4,327.40	13,263.32	17,590.72
Kilnwood	2,879.00	2,424.00	5,303.00
Staves	132.08	340.66	472.74
Pulp		54,615.29	54,615.29
	$92,119.38	$243,772.96	$335,892.34

MAINE LUMBER.

Long lumber	$519,150,96	$277,377.30	$796,528.26
Laths	45,182.41	40,213.73	85,396.14

Staves	235.54	533.70	769.24
	$221,926.21	$220,867.86	$442,794.07
AMERICAN LUMBER.			
Lath	$ 32,744.98	$ 33,899.81	$ 66,644.79
Lumber	247,258.65	106,396.79	353,655.44
Shingles	33,153.00	43,468.75	76,621.75
Clapboards	3,544.00	3,099.00	6,643.00
Shooks	1,648.12		1,648.12
	$318,348.75	$186,864.35	$505,213.10
Total	$540,274.96	$407,732.21	$948,007.17
Grand total for 1899			$1,294,055.76
Grand total for 1900			948,007.17
Decrease in 1900			$346,048.59

The export trade of the province is carefully reviewed by Hon. J. B. Snowball in his annual Miramichi Wood Trade Circular, from which the following details are extracted :

Advanced freight and high insurance rates had a curtailing effect on fall business, producers refusing to ship without seeing a prospect of realizing first cost; consequently wintering stocks at this port are slightly larger than last year and shipments proportionately less.

Shippers from this port are not able to keep pace with the cheaper productions from Nova Scotia and the Bay of Fundy ports, as the latter largely escape the high stumpage taxes to which lumbermen in the northern portions of New Brunswick are subject ; and in view of the fact, also, that cheaper supplies and labor are available for their operations.

The stock of merchantable spruce and pine wintering here is 33,000,000 superficial feet, against 32,000,000 last year and 40,000,000 in 1898—4,500,000 superficial feet being pine, against 6,293,000 superficial feet last year.

SHIPMENTS FROM MIRAMICHI FOR 10 YEARS, FROM 1891 TO 1900, INCLUSIVE.

1891–72,000,000	1895– 82,000,000	1899–129,000,000
1892–95,000,000	1896–106,000,000	1900–122,000,000
1893–83,000,000	1897–102,000,000	
1894–96,000,000	1898–113,000,000

BRITISH COLUMBIA.

A moderate local demand for lumber was experienced by the manufacturers of British Columbia during the year, although the consumption for domestic purposes was not as great as in 1899. There was less activity in building and mining operations and consequently a falling off in the demand for lumber. The Manitoba and eastern trade compared favorably with the previous year, a feature of eastern orders being the

call for large timber. Unfortunately, however, the consumption in Manitoba and the Territories is still partially supplied by United States manufacturers, the Dominion Government having as yet taken no action towards placing a duty on the United States product. British Columbia manufacturers report that the difficulty of obtaining raw material is steadily increasing; loggers demanded higher prices for logs, which reduced the profits of manufacturers.

If the domestic trade was not all that could be expected, the loss in this respect was more than offset by the increase of cargo shipments to foreign countries. It was a banner year in the export lumber business, the shipments being greatly in excess of any previous year. The total value of the lumber shipped from the province by vessel was $767,121, as compared with $432,151 in 1899 and $406,001 in 1898. These figures show an increase of more than 53 per cent. A still greater volume of export business would have been done but for the lack of tonnage, it being found almost impossible in some instances to effect charters. Freight rates ruled very high, 92 shillings being paid from Vancouver to a South African port; 82 shillings to the United Kingdom; 63 shillings to Melbourne, Australia, and 62 shillings to west coast of South America. The quantity of lumber exported to foreign countries was 76,208,087 feet. The following table shows the point of shipment, destination, and value of the various cargoes:

The value of shipments to the different countries in comparison with the previous year is shown below:

	1899.	1900.
Australia	$152,329	$298,323
United Kingdom	.....	222,887
South America	52,621	83,875
South Africa	58,563	47,268
China	113,348	23,713
Japan	24,284	21,185
United States	17,000	16,861
France	.....	32,970
British India	29,306	.....
Fiji Islands	.....	5,600
Mexico	.....	12,439
Totals	$432,151	$767,121

It will be observed that the shipments to China show a large falling off, while increased shipments were made to South America, Australia, and the United Kingdom. Those to Australia were approximately 32,000,000 feet, or double the previous year, and to the United Kingdom there were shipped 21,000,000 feet, as against no exports to that country in 1899. Notwithstanding the war in South Africa, the lumber shipments to that country show but a slight decrease. South America took about 9,000,000 feet.

Seventy-six vessels were employed in carrying the lumber. Of these, 33 loaded at Chemainus, 19 at Vancouver, 15 at Moodyville and 9 at New Westminster. Below is given a summary showing the gain of each port:

From	1900 Lumber, F.	1899. Lumber Ft.	Per Cent Gain.
Chemainus	38,365,833	24,952,042	53.8
Vancouver	20,138,612	12,553,087	60.4
Moodyville	14,700,467	9,615,655	52.9
Esquimalt, etc.	3,003,175	2,620,180	14.6
Totals	76,208,087	49,740,964	53.2

British Columbia shingles were in fair demand throughout the year, but the production is too great for the limited market, and steps were taken towards the close of the year to curtail the output. The volume of business with eastern jobbers was about the same as in 1899. Towards the fall there was a slight weakness in the market, although few sales were made below the regular price list.

The outlook for 1900 is not altogether promising. The export demand is expected to keep up, but as the Government has discontinued the rebate on timber exported from the province, there will be a smaller margin of profit in this branch of the industry. The hope of the lumbermen of the province is that the Dominion Government will impose a duty on United States lumber similar to that placed on Canadian lumber entering the United States.

MANITOBA.

There was considerable activity in the manufacture of lumber in Manitoba and the Territories in 1900, although the bulk of the consumption in these provinces is imported. The report of the Department of Interior for the year ending June 30th last states that in Manitoba the saw mills were run to their fullest capacity, the output being about 24,000,000 feet b.m., an increase of 4,000,000 over the previous year. The output in the Territories was 13,510,287 feet b.m., in the railway belt in British Columbia 29,684,003 feet b.m., and in the Yukon Territory about 9,000,000 feet b.m. In addition to the lumber sold by mill-owners in Manitoba, it is reported that no less than 132,669,083 feet of lumber was sold in Manitoba and at points as far west as Regina, the bulk of which came from the mills at Lake of the Woods and Rainy River. Although the shipments from the United States still continue large, there has been a falling-off as compared with last year's business. The number of timber berths under license in Manitoba and the Territories is 171.

The anticipations of lumber dealers that the year would witness an exceptionally good demand for lumber was not altogether realized. The market after midsummer was inclined to be quiet, and the practice of cutting prices was indulged in to some extent, thus reducing the profits of the business. The prospects for the coming season are of a satisfactory character, the hope of increased building operations in Winnipeg and the provincial towns being a favorable feature.

ANOTHER FOREST RESERVE.

THE Ontario government has announced the creation of a forest reserve in the vicinity of Lake Temagami. The reserve embraces about 2,000 square miles of territory, equal to 1,400,000 acres, surrounding Lakes Temagami and Lady Evelyn. The location of these lakes is to the west of the Upper Ottawa river, in the district of Nipissing. It is proposed by this reservation to preserve the head waters of the chief rivers in the Nipissing district; the timber on these lands will also be preserved intact, and the native game that their abides will also have a safe resting place.

Until the government see fit to grant special permission, no one will be allowed to cut timber on this area, although there are said to be there on 5,000,000,000 feet of white pine. If, however, permission should be granted to cut the timber, part of the plan will be to reforest what is cut over in order to keep a succession of forest growths in the reserve. Rangers will be appointed to take precaution against the spread of fire.

There were previously in existence in Ontario two smaller forest reserves, one in the rear of Addington and Frontenac counties, containing 80,000 acres, and the other on the point of land ending in Thunder Bay, Lake Superior, containing 45,000 acres.

AXE AND SAW COMPETITIONS.

OUR readers will no doubt be interested in some particulars of the axe and saw competitions which are held annually in Tasmania, an Island belonging to the Australian federation. It will be necessary first to refer to the conditions which brought about these contests. The majority of inhabitants are either settlers cutting out homes for themselves, or men earning a living by felling timber for saw mills, by splitting timber into post rails or palings, or by felling the scrubs by contract for the more wealthy class of settlers who are making clearings in the forests. Many of the settlers have but little education. Their best loved weapon is the axe. From their desire to excel in their work arose the Australasian Axemen's Association, formed for the purpose of demonstrating the skill to which the settlers in the colonies have attained with the axe and saw. Since June, 1891, annual contests have been held. The ninth of these was held last year.

FIG. 1.—THE CHAMPIONSHIP MATCH—LYING BLOCKS.

For the championship of the world in standing block chopping, i.e., logs placed just as though the trees were still growing, there were about a dozen contestants, and the blocks were of stringy bark, freshly cut, and trimmed to exactly 6 feet 4 inches girth, the work of cutting being accomplished by the winner in 4 minutes and 8¼ seconds.

A second event was the underhand championship chop, i.e., chopping through a log 6 feet 4 inches in girth whilst it was in a lying position such as is occupied by a tree when it has been felled. Another interesting event was the championship sawing match, the men to cut through a similar sized log, 6 feet 4 inches. This was accomplished by the winner in the marvellously quick time of 1 minute 49 seconds. In the double handed sawing match, one man on each end of saw, a log 2 inches in diameter was cut through in 34½ seconds.

The most interesting features of the competition were the contests in axes and saws by international teams. These contests were inaugurated for the purpose of giving the manufacturers of Great Britain an opportunity to prove to the world that they could produce axes and saws equal to the tools made by the Americans, the latter having practically monopolized the trade of Australia in late years. The winning manufacturer in each case was to receive a gold medal. Each manufacturer who entered sent in his lot of axes or saws, and these were sharpened to correct pitch prior to the day of the contest. The result was that a victory was gained for English axes by three points. Not so with the saws. Three American saw manufacturers and one English manufacturer entered, but the latter failed to come to the starting point and the award was given to the Atkins' saws, with the Simonds' saws second.

The above particulars and the accompanying illustrations are taken from the Chicago Hardwood Record.

MERITS OF DIFFERENT SAWS.

The following opinions regarding the merits of different saws came to hand after our January number had gone to press :

NANAIMO, B.C., Dec. 24th.—My views on the relative merits of the circular, band and gang saws are as follows : The circular will get out more timber into the several kinds that the log is suited for, and with less care, but more waste, than the band. The band takes less power and less kerf than the circular and has the same advantage that the circular has for picking lumber of different sizes and qualities out of the same log. It requires more care, but when fllers become impressed with the fact that the mill will work even if they quit, the band will be the mill of the future. For quality and quantity without regard to the suitability of the log for the lumber cut, the gang takes the lead.

A. HASLAM.

OTTAWA, ONT., Jan. 5th.—My experience goes to show that the gang or Wickes gate is the most desirable for the cutting of all kinds of lumber say 3″ and under in thickness, making the lumber more even in thickness than the band or circular saws. But I prefer the band saw for cutting 4″ and up in thickness or dimension timber of any size, owing to the small waste in saw-dust. The twin circulars I consider the best for slabbing small logs, but for no other sawing, as the waste in saw-dust is too great. The band saws cannot be beaten for getting the most good lumber out of a log.

J. R. BOOTH.

RAT PORTAGE, Jan. 1st.—There is, as you know, much difference of opinion concerning saw mill machinery, and especially with regard to the different kinds of saws which should be used. I have arrived at the conclusion, after twenty years' experience, that circular saws are a thing of the past, especially where logs are worth seven dollars per thousand or upwards ; the waste in sawdust is altogether too great to allow of their being used successfully in competition with band saws. The band saw under all circumstances reduces the waste to about one-third, and where two-way cutting band saws are used the capacity of the band saw is greater than that of the circular, with very little extra expense for the running of it. Gang saws can be used successfully where mills of large capacity are required ; for example, where a capacity of one hundred thousand feet of lumber per day or upwards is required, a gang may be used in connection with one or two band saws, but where smaller mills answer the requirements, I should say a band saw or a band saw and a band re-saw should be used. With a two-way cutting band mill and band re-saw workedin connection with it, nearly one hundred thousand feet of lumber per day can be produced with the greatest economy both as to labor and saving of the log, owing to the thinness of the plate of the band saw.

D. C. CAMERON.

Manager Rat Portage Lumber Co.

GRAPHITE AS A LUBRICANT.

GRAPHITE is a good lubricant when it can be placed and kept where it is needed. A shaft running in a graphite bushing is perfectly lubricated, and needs no oil or grease. Such a shaft will also run with very little friction. But, in ordinary bearings, the problem with graphite is to place it where the friction is. When oil is used, it will insinuate itself into a pretty small place between the bearing surfaces, and will flow readily through long and crooked passages. With graphite, on the other hand, there is a pretty big problem as to how the stuff is to be gotten into a bearing. A powdered material cannot be made to flow like oil, no matter how it is tried, and there seems to be no means of using graphite except by mixing it with a liquid that shall act as a vehicle for the powdered material. By doing this the object of using graphite is largely lost sight of, for oil has to be used in the bearings as before. Before graphite will displace lubricating oil, there will have to be devised some means of blowing the substance into the bearings, and of keeping it there when once in the right place. When that is done, all hail to graphite.

FIG. 2.—THE SAWING MATCH IN FULL SWING.

THE
Canada Lumberman

MONTHLY AND WEEKLY EDITIONS

PUBLISHED BY

The C. H. Mortimer Publishing Company
of Toronto, Limited

CONFEDERATION LIFE BUILDING, TORONTO

BRANCH OFFICE:
IMPERIAL BUILDING, MONTREAL

The LUMBERMAN Weekly Edition is published every Wednesday, and the Monthly Edition on the 1st day of every month.

TERMS OF SUBSCRIPTION:

One Copy, Weekly and Monthly, One Year, in advance..... $1.00
One Copy, Weekly and Monthly, Six Months, in advance..... .50
Foreign Subscriptions, $2.00 a Year.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in anyway affecting it. Even when we may not be able to agree with the writers, we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

CANADIAN FORESTRY EXHIBIT AT THE GLASGOW EXHIBITION.

THE Canadian forestry exhibit at the Paris Exposition was one that did credit to Canada and to the Exposition commissioners under whose instructions it was got together, but it is understood that a larger and more complete exhibit will be sent to the Glasgow Exhibition, which is to open on May 1st of this year and continue until November. Everything that was shown at Paris, with the exception of a few manufactured articles which will be replaced by new material, will be on view at Glasgow, and an effort is being made by the Minister of Agriculture to secure additional material from Canadian producers and manufacturers.

The value of such exhibitions cannot be overestimated, and none of the objections made by manufacturers to exhibiting at Paris apply to Glasgow. Users of wood and articles manufactured from wood from all parts of the world will visit the exhibition, and Canadians who are interested in the manufacture of wood products can find no better advertisement for their products than will be afforded by this exhibition.

It is noteworthy that the international exhibition held at Glasgow in 1888 was attended by over six millions of people. It is only reasonable to suppose that at the forthcoming exhibition this number will be exceeded. The international character of the exhibition can best be shown by giving the names of the countries whose official support has been secured, in addition to the exhibits of the United Kingdom. They are: Russia, Denmark, France, India, Australia, Japan, Morocco, Queensland, Mexico, British South Africa, Persia, South Australia and Canada. Canada is to have a special building, covering about 12,000 square feet, wherein to make exhibits.

MEANING OF BRITISH TERMS.

Two terms in general use in the British timber trade ate "f. o. b." and "c. i. f." The former is commonly used in this country, meaning, of course, the delivery of goods on board a ship, car or other appointed place. The latter term is seldom made use of by the lumber trade of Canada, excepting by shippers to foreign countries. We have occasionally been asked to give the meaning of the term, and our explanation has been that a contract made on a "c. i. f." basis would provide for the delivery of the goods at the port named, the costs of the merchandise in the country to which it is exported, freight to port of unloading, and insurance being paid. To illustrate, we will assume that an importer in London, England, enters into a contract with a Quebec shipper to supply a cargo of lumber at a certain price c. i. f. London. The shipper, therefore, becomes responsible for the delivery of the goods at that port, and for the payment of all costs, freight and insurance until that time.

Notwithstanding that this term has been in use many years by British timber merchants, there still seems to exist some ambiguity of meanin, as well as regarding the obligations which it places upon sellers and buyers. This is illustrated by a recent occurrence. A Manchester merchant purchased a quantity of goods in Calcutta, to be shipped to Larnaca, in Cyprus, the contract stating that cost, freight and insurance was to be borne by the shippers. Owing to the plague in India the authorities at Port Said, where the goods were to have been transferred to a steamer for Larnaca, would not allow them to be landed, and they were taken to London. They were put on board a steamer for the East Mediterranean, and after some further difficulties and a second trans-shipment reached their destination. The question naturally arose as to who should bear the extra cost of freight incurred by the incidents above mentioned. The seller contended that having put the goods on board at Calcutta in good condition and paid the insurance premium and freight to the proper destination, his responsibility ceased. The buyer, on the other hand, held that the acceptance of the c. i. f. terms imposed upon the shipper the responsibility of assuming all the actual expense incurred to the port of destination. The dispute was referred to arbitration, and the award was finally given in favor of the shipper, thus making it incumbent upon the buyer to assume the extra expense.

The decision in this case has not been generally accepted by the timber trade, many of whom are strongly of the opinion that the shipper, in agreeing on the c.i.f. terms, accepts the responsibility of just such accidents as the one in question. The difficulty was encountered before the shipper had finally completed his contract, and it would seem unfair to place the responsibility upon the importer, who, according to the contract, does not come into possession of the goods until delivered at the port called for.

THE PRESERVATION OF CANADIAN FORESTS.

UNTIL recently it could truly be said that no steps had been taken to preserve the forest supply of the Dominion. The Federal Government apparently had not recognized the necessity of providing for future needs in this respect, and of the Provincial Governments, only that of Ontario had shown a proper recognition of the subject. The recent action of the Ontario Government in creating a forest reserve of 1,400,000 acres in the vicinity of Lake Temagami is but following up the commendable policy of establishing such reserves which was inaugurated a few years ago.

It is a source of satisfaction to learn that the Dominion Government has now under consideration the adoption of a system of forestry, and that an effort is to be made to provide an ample timber supply for Manitoba and the Territories. It is not generally known, as pointed out by the Dominion Superintendent of Forestry at a meeting in Toronto recently, that there are in the North-west, north of the prairie region, 1,186,000 square miles of timber lands under the control of the Dominion Government. This is a larger area than the combined territories of Ontario, Quebec, Nova Scotia, Prince Edward Island, Manitoba and British Colombia. Of course much of this territory is north of the height of land, and as the streams flow northward, the timber thereon can only be made available by the construction of railways. Nevertheless, these forests are an asset of great value, and should as far as possible be preserved from fire.

In the preservation of her timber Canada should profit by the experience of the older countries of Europe. Germany and France were among the first to apply scientific forestry. In 1740 Frederick the Great promulgated laws regulating the cutting of timber in Germany. He established rotations of seventy years, and also prescribed methods of thinning so that the young and healthy growth of trees would be better protected. He established forests under the care of wardens, forbade private owners from wasteful cutting, and placed under the care of the State a portion of the forests in Silesia. Yet with these precautions, established at such an early date, we find that in 1899 Germany imported 36,000,000 cubic feet of timber, and forestry experts admit that the Empire will never be in a position to supply her own market.

The total area of state forests in France is 2,700,000 acres, which yield annually to the state a total of 96,100,000 cubic feet of timber, equivalent to nearly 46 cubic feet per acre of productive forest. The gross annual income is £1,100,000, or about 10 shillings 6 pence per acre. The high trees are cut down at periods ranging from 120 to 150 years, the work being directed in a way that will insure natural re-forestation from the seeds that fall from the standing trees.

Great Britain, as is generally known, possesses no forests of any account. This is well demonstrated by the fact that last year her importations of hewn and sawn timber, not including manufactures of wood, reached in value $125,000,000.

The United States has of late made marked advancement along the line of forestry, having established several important reserves. A bill is now before Congress providing for the purchase

of 2,000,000 acres of forest land in the States of Virginia, North and South Carolina, Georgia, Alabama and Tennessee, and appropriating five million dollars for the purpose. The reserves previously established have been in the northern and western States.

The setting apart of forest reserves and the adoption of a system of scientific forestry are questions which should at once be taken up by the Dominion and Provincial Governments. The proposal to establish a forestry department in connection with one or two of the leading universities of the country is a step in the right direction.

EDITORIAL NOTES.

It is not unlikely that the Dominion Government will be petitioned to remove the duty on cooperage stock coming into Canada from the United States. This duty is 25 per cent. on manufactured stock, cooperage material in the rough being admitted free. The reason for this movement is claimed to be that the Canadian manufacturers of cooperage stock are unable to supply the local demand, and that it has been necessary to import considerable material from the United States. It is by no means certain that the government would accede to this request if asked to do so, as while it would result to the advantage of one or two large Canadian firms who have mills across the border, it might seriously affect the smaller producers of cooperage stock in Canada. It is at least fair to point out that such action is under consideration, and to give all who are likely to be affected an opportunity to place their views before the Government.

In the past more or less reliable estimates have been made of the quantity of pine timber standing on the Crown lands of Ontario. The provincial estimate of 1893 showed the quantity to be 26,000,000,000 feet, of which 10,000,000,000 feet were under license. The territory explored for the purpose of this estimate did not include a large tract of country north of the height of land. Of the other varieties of timber owned by the Crown no estimate has ever been made. The necessity of securing a more accurate statement of the Crown timber has been felt by the Government of the province for some time. It was recently decided to make explorations with a view to securing the necessary data and accompanying maps, showing the quantity and location of both pine and spruce timber, the latter now having a merchantable value that it did not possess at the time previous estimates were made—due to the growth of the pulp industry in Canada. It is hoped that the plan of the Government will include also the collection of data concerning the hardwoods of the province. It is quite a common thing to receive inquiries regarding the location of hardwood timber of certain varieties, but the imformation which it has been possible to impart has been a very uncertain character. If more accurate data were available it would greatly assist the development of the hardwood industry.

WESTERN RETAIL LUMBERMEN'S ASSOCIATION.

Although the date has not been definitely arranged, it is expected that the annual meeting of the Western Retail Lumbermen's Association will be held in the city of Winnipeg on or about February 16th. Mr. Henry Byrnes, of Winnipeg, is president of the Association.

THE CULTIVATION OF FORESTS.

AN IMPORTANT MEETING IN TORONTO. — INTERESTING ADDRESSES AND VALUABLE SUGGESTIONS REGARDING TREE PLANTING.

A meeting under the joint auspices of the Canadian Institute and the Canadian Forestry Association was held in the Canadian Institute, Toronto, on Saturday evening, January 12th. The meeting was very largely attended by members of the Institute and persons specially interested in the subject of forestry. Mr. James Bain, jr., presided, and after a few opening remarks called upon Mr. E. Stewart, Superintendent of Forestry for the Dominion, to give an address. His remarks in full are given below:

FORESTRY AS IT RELATES TO LANDS UNDER THE CONTROL OF THE DOMINION GOVERNMENT.

BY E. STEWART, Dominion Superintendent of Forestry.

In the few remarks that I shall make I purpose confining myself to forestry as it relates to Dominion territory as distinct from that of those Provinces which control their own land and the timber growing thereon.

According to the agreement entered into at the time of Confederation, each of the Provinces, namely, Ontario, Quebec, Nova Scotia and New Brunswick, retained the ownership of any ungranted lands within its limits, and when Prince Edward Island and British Columbia subsequently came in they did so on the same conditions. Shortly after the union the Federal Government became possessed of the Hudson's Bay Territory, a district of vast extent in the interior of the Continent, which now forms the Province of Manitoba and the North-West Territories, the latter being now divided into a number of territorial districts. Subsequent to this the Province of British Columbia handed over to the Dominion as her contribution for the building of the Canadian Pacific Railway through the Province, a tract of 20,000 square miles of great value for its timber along the line of the railway. This tract is forty miles in width each side of the track. So that the territory of which the Dominion was first owner embraced these great areas, with the exception of a small percentage retained by the Hudson's Bay Company, and though the aggregate of land and timber that has so far been granted by the Crown to private parties, corporations, etc., is very considerable, yet in a relative sense it is a mere trifle as compared with the total area.

Let us endeavor to obtain some idea of the total area of this territory. I shall first give a few figures which must be taken as only approximately correct, though it is believed that the errors will be in under-estimating, not in over-estimating, both the area of the land and the timber thereon. The total area of Dominion lands, including that owned by the Hudson's Bay Company and that of the railway belt in British Columbia, is estimated at 2,456,500 square miles. The total area of the five Eastern Provinces and British Columbia, less the railway belt, is 860,000 square miles. That is, the total area of the territory under Dominion control is about three times that which is owned and controlled by the Provinces.

But our subject is confined to the timber and not necessarily to the extent of land that either the Dominion or the Provinces possess, and it will be said that inasmuch as we have included both the prairie lands of the Dominion and the barren treeless areas of the far north in our calculation, it is of no value for our purpose. This is true enough, and we must now attempt to ascertain as nearly as possible the extent of that land which is not timbered and deduct the same from the total area.

The general impression of those whose only information is derived from a trip across the Continent on the Canadian Pacific Railway will be that most of the North-West consists of prairie land, and that after leaving Ontario on the east till we reach British Columbia on the west, there is no timber worthy of notice. Now, this is not incorrect so far as the country through which the railway runs is concerned, but we must remember that this railway traverses the full length of the prairie section of the country. If, however, the traveller, instead of continuing straight on along that line, would at almost any point within this prairie section turn at right angles and go north, he would not be able to proceed more than two hundred or three hundred miles at most from the United States boundary before he would have left the prairie behind and entered what is known as our great northern or sub-arctic forest belt, which extends from there far north to the limit of tree growth.

This prairie section may be roughly estimated at 250,000 square miles, and the treeless land of the far north at 1,000,000 square miles; and this taken from the total of 2,436,000 square miles will leave 1,186,000 square miles as the area of the timbered lands, or over 300,000 square miles more than the total area, both cleared and timbered, contained in the six Provinces above referred to.

It must not be inferred that this immense tract is a solid forest, but what is not covered by lakes or streams on the one hand, or is not too mountainous on the other, will be properly classed as wooded country, the prevailing species of the northern belt being the white and black spruce, tamarac, balsam fir, Banksian pine, poplar and birch. Of these the spruces are the most widely distributed, and considering the great number of uses to which wood pulp is now being applied, and that spruce is of all varieties the one best adapted for that purpose, it seems very probable that this timber will in the future take the place so long held by the white pine in this country as the chief variety sought after by the lumbermen. It should be borne in mind that a large part of this wooded area of the north is better fitted for the growth of timber than for any other purpose.

There is no one who has ever travelled through the woods of the Provinces of Quebec and Ontario, or in fact any of the Canadian provinces or territories, who has not been impressed with the immense destruction that has resulted in forest fires. It is not an extravagant estimate, but well within the mark, to place the proportion of pine trees destroyed by fire as compared with those cut by the lumbermen as ten to one, while the value of the timber which has thus gone up in smoke would be more than sufficient to pay our national debt. And this destruction will continue to render barren and worthless a large portion of that vast area above referred to as under the control of the Federal Government unless very great care and attention is bestowed on its preservation. In fact, the conditions existing in the northern region are such as to render forest fires most destructive. A large part of the country is rock with scarcely any soil covering, but covered with moss and also hanging from the branches of the coniferous trees are thick bunches of moss. In a dry time every particle of moisture is evaporated from the forest floor, the moss on the rocks and also that on the trees is as dry as tinder, while the gum on the trees helps to make a more lasting fire. With such conditions it is not difficult to imagine the immense destruction produced when a fire gets started in these woods. Now the question is, can anything be done to stop or even lessen the destruction from this cause.

The Royal Commission on Forestry in Ontario, appointed in 1897, in their reports say :

"While there have been even within recent years extensive and devastating fires, destroying large amounts of timber, the saving to the province effected by the system of fire-ranging adopted in 1886 has nevertheless been very great. During the course of their investigations, your commissioners had brought to their notice a great many instances in which incipient fires, that unchecked would have been disastrous in their consequences, were successfully fought and suppressed by the rangers.

"Wherever the system has been employed by the various limit-holders, the results have been very marked. It is to be noted, however, that as the employment of fire-rangers is optional with limit-holders, some of them have failed to take advantage of the system, at the risk not only of their own limits but of those of their neighbors in addition.

Again in the Interior report we find the following :

"All unregulated fires must be strictly guarded against and prohibited. Every acre of forest lands under license, and all government lands in their immediate vicinity, or wherever prospectors or tourists are allowed to go, should be under the supervision of competent fire rangers, strictly under government control, and clothed with full power to call to their aid needful assistance to extinguish fires."

"Young growing trees too small to cut profitably and often neglected by licensees as of no value, should be zealously guarded as the source of future wealth, and all isolated pine trees or small groups of trees still living after a fire has passed over a district, should be taken care of as the parents of future forests."

Mr. W. C. Edwards, one of the leading lumbermen of

the Ottawa Valley, writes as follows: "Imperfect though the system of fire protection now in vogue in the Provinces of Ontario and Quebec may be, at the same time the result has been the saving of millions of dollars worth of timber to these provinces. Previous to the employment of fire rangers in the Province of Quebec, annual serious fires took place in the Ottawa region, destroying enormous quantities of timber. Since the adoption of the fire ranging system, there has not been, so far as I am aware, one very serious fire."

I may say that within the past year a system of forest fire guarding has been undertaken by the Dominion Government, differing in some respects from that adopted by the province, but it is believed that it is one well adapted for the purpose, and so far seems to work well. The plan is as follows: Forest fire rangers are selected from men residing in or near the district where they are to be employed. They are notified that they will be under the direction usually of the crown timber agent, regular forest ranger or homestead inspector for the land agency in which they are employed. When this supervising officer considers their services are required he notifies them to commence work, furnishes them with a copy of the Fire Act, a copy of general instructions defining their duties, and also with notices, for posting up and distributing warning, the public against the careless use of fire. Where horses can be used they are to supply themselves with them. Their remuneration in such case is $3 per diem, which includes expenses for both man and horse. When the supervising officer considers it unnecessary for the ranger to continue the work he recalls him and instructs him to make out his account, which the former certifies to as correct, and on forwarding the same to the department with a diary detailing how he was employed each day, the account is paid. By this system the ranger is employed only when his services are considered necessary, and in case the season is very wet he may not be employed during the whole season. Where there are timber limits under license within the area guarded the holders pay a proportionate amount of the cost, but the greater part of the country is still held by the crown and consequently the government bears the larger part of the cost of guarding it.

There is another point in this connection that properly belongs to the forestry branch which I desire briefly to notice. The country should be explored in advance of settlement, and such portions as are unsuited for agriculture, but which are adapted for the growth of timber, should be permanently set apart for that purpose and not even surveyed into farm lots. Again, as one of the great uses of the forest at the sources of rivers and streams is to hold back and regulate the even flow of the water much in the same way as a reservoir does for towns having a waterworks system, in no case should these districts be denuded of their forest covering, but retained for this, if for no other purpose.

Another duty devolving on those having charge of the forests is to regulate the cutting of the timber on tracts set apart for timber purposes. There is no reason why the element of growth should be disregarded, or why by a proper system of cutting a continuous supply should not be maintained, provided the fire can be kept out of the woods. The indiscriminate cutting of the young saplings struggling to attain a sufficient size when they would be of value is a sin against nature and a crime against the community that should not be tolerated.

But I have dealt with only that portion of the subject that related to those districts on which there is a natural growth of timber, and I wish very briefly to refer to those areas of the North-West wbich are now devoid of tree growth, to those treeless plains where the many comforts and advantages which trees afford do not exist.

As this phase of the subject will be dealt upon by others well qualified to deal with it, I shall refer only to one or two points in connection with it. It is admitted by everyone that it would be of the greatest benefit to the prairie settler to have wind breaks and shelter belts of trees on his homestead. I will grant that there is a peculiar charm in viewing those great undulating meadows, especially when they are covered with flowers in the spring time, but there is also a dreary monotony akin to melancholy which becomes oppressive when its novelty is gone. The silence is unbroken. The old familiar bird songs are not there to cheer the pioneer settler in his oneliness, but instead he is oppressed with the almost constant wind which has no obstacle to break its force. In summer the cool shade which our woods afford, and in winter the protection they render, are both denied to him. The advantages that belts of timber growing on the homestead confer on the prairie farmer are various. In addition to the beauty they bestow on the landscape and the comfort they afford to the settlers, they are of direct value in the shelter they provide for both man and beast, decreasing the quantity of fuel used in the dwellings in the winter and the amount of feed necessary for the stock. As windbreaks they prevent the snow from drifting off the fields, leaving them so dry in spring as to be unable to withstand that scourge which the western farmer fears more than any other, the summer drouth. And this is not all; they are also a protection against the destructive dry, hot winds that blow so frequently over those parched plains during the summer season. Mr. S. A. Bedford, superintendent of the Experimental Farm at Brandon, in one of his reports says: "The last week of May and June were noticeable for very low temperatures and high windstorms which were very disastrous to the crop in exposed situations. The benefits of hedges and shelter belts are very clearly demonstrated at this time. The grain growing on portions of the farm protected ever so slightly by a hedge or breakwind escaped injury from drifting soil, and when this was followed by severe frost the unbruised plants in the protected areas were not frozen, while the exposed grain was in many instances completely killed."

Our various governments have long recognized the wisdom of assisting the agriculturist, and it is believed that the whole aspect of our prairie country may be changed by the co-operation of the government with the farmers. It is beyond doubt that where grain can be raised, there also some varieties of forest trees can be successfully grown, and I may be permitted to state that it is expected that during the coming season a regular system of afforestation will be commenced by which the government will endeavor to do its part in co-operation with the settlers to bring about the desired results.

One feature of this work will be the instruction of the people regarding tree planting. It is well known that careless planting and want of attention after planting are frequently the cause of failure in growing trees, not only on the plains but nearer home, and I would like to make just one suggestion here, and that is that more attention might be profitably given to the subject of forestry in the schools of the country.

Now, it may be asked why we should come to the city of Toronto to discuss the forestry problem. You say it may be of interest to the lumberman or to the prairie farmer, but what interest can the towns and cities of Ontario have in the subject.

My reply to this is that there is no citizen of Canada, no matter whether he reside in the rural or urban districts, who should not be interested in the forestry of the country. It is well known that this province derives a very large proportion of its revenue from the timber growing on its public domain. So as citizens of the province you are directly interested in the management of the forests on the Crown lands of the province. Again, as previously pointed out, as citizens of Canada you are the possessors of vast forest wealth in the ungranted lands of the Dominion, but more than this, if you will but take a glance at the countries of the old world you will find that many large districts owe their decline to the ruthless destructions of their forests. The effects of over-denudation of the forests even in Ontario is now witnessed almost every spring in the disastrous floods that occur and which are becoming annually more and more frequent and destructive.

In the countries of Southern Europe bordering on the Mediterranean, in Spain, Italy, Greece, Turkey, and also in Northern Africa, there are large areas of barren waste, which in the middle ages were fruitful, cultivated valleys. This has been caused by the destruction of the forests and the consequent drying up of the country. So great is the influence of the forest that several writers attribute the decline of many of the nations of the earth to the aridity of the land, brought about by the wholesale depletion of the forests.

When all this is considered, I think we may ask you to urge your representatives in parliament to use their influence to promote a judicious system for the protection and management of the existing forests and for the encouragement of tree planting wherever such is desirable.

I may say in conclusion that within the past year, in order that those who felt an interest in this subject might most effectually exert their influence, a Canadian Forestry Association has been formed and is doing most excellent work, and I would commend it to you as worthy of your membership.

Prof. John Macoun, of the Geological Survey of Ottawa, who has for many years been a close observer of forestry principles, was the next speaker. He opened his remarks by relating an incident which occurred sixteen years ago, when he was invited to Rideau Hall by Lord Lansdowne, then Governor-General. Being asked by His Excellency what was the chief occupation of Canadians, he replied that it was the destruction of our forests. At that time, he said, this seemed to be the sole aim of the people, but conditions have changed. Prof. Macoun spoke extempore, but we give below the address which had been prepared, and which may differ in detail from the remarks of the speaker:

ON CLIMATIC CONDITIONS IN MANITOBA AND THE NORTH-WEST TERRITORIES, WITH SPECIAL REFERENCE TO REFORESTING.

By Prof. John Macoun.

Three factors are always necessary in successful tree growth or culture. These are heat, moisture and altitude. Winter cold is injurious and in many cases is an insuperable barrier to success, but is not prohibitive to reforesting. Before seeking to reforest any section of the country the first thing to be considered is the existing conditions, and secondly, those which pre-existed. The pre-existing conditions are those shown by an old forest. The proper species to replant are those found in such a forest, but the cutting away of the forests may cause summer droughts, and if so care should be taken to counteract these before planting is commenced.

I have heard it asserted that after a forest has been burnt over the same species of trees will not cover the ground again. This is only a seeming truth, and if it were said that they generally do not, it might be nearer the truth. Let us enquire why the same species do not usually cover the ground after a forest fire. There are doubtless many in the audience who have been in a piece of unburnt maple and beech forest left by the farmer for firewood. From many of these firewood has been taken for thirty of forty years, and yet young maples and beeches are found in myriads unless eaten down by the cattle, and this forest being in all stages will continue for untold generations, because what is taken from the soil is returned to it by the constant decay.

Should a fire run through these very woods, and a young growth spring up, instead of maple or beech we will find poplars and cherry predominating, and in the north birch. A little thought will show that it is the burning of the seeds that is the drawback in the case of maples. The same reasoning will apply to every case. The sole cause of this is the want of seeds. Pine forests when burnt over are also spoken of as not replacing themselves, but this also is a fallacy, except in the case of repeated burnings where all the seeds are destroyed. All woodsmen know that the seeds of conifers are stored by ground squirrels and mice in old logs and around roots, and after one burning of the forest the seeds germinate in myriads, and a close observer about the second year after the fire will find seedling conifers on every old log and by every old stump, and this is one of the most important factors in the reforesting of pine lands by nature. The ground is then covered by weeds, shrubs and trees which are of quick growth, and not a pine is to be seen, but within ten years after the fire the pine begins to assert itself, and in 50 years we have a pine forest. The whole of this is well shown along the Petewawa River and Catfish Lake in the Algonquin Park.

The reforesting of the prairie region is a different question and needs more careful treatment. I will state a few facts and later draw a few conclusions from these facts. The beech ceases to grow before we reach Lake Superior. Sugar maple ceases on McKay Mountain, a few miles from Port Arthur. Basswood comes up the Red River and extends westward to Morden. Overcup oak remains as a forest tree for 200 miles and more west of Winnipeg. Red or green ash was formerly abundant in the Red River valley and extends westward to the foot of the Dirt Hills, 400 miles west of Winnipeg. The elm—a river bottom tree—was found four years ago in the

THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN, THE UNITED STATES, AND OTHER FOREIGN MARKETS.

VOL. VII. TORONTO, ONT., JANUARY 30, 1901 No. 1

CANADA LUMBERMAN

PUBLISHED BY

The G. H. Mortimer Publishing Co'y of Toronto, Limited

Confederation Life Building - TORONTO.

Branch Office:
IMPERIAL BUILDING, MONTREAL.

Weekly Lumberman, published every Wednesday. Contains reliable and up-to-date market conditions and tendencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canaian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

Lumberman, Monthly. A 20-page journal, discussing fully and impartially subjects pertinent to the lumber and wood-working industries. Contains interviews with prominent members of the trade, and character sketches and portraits of leading lumbermen. Its special articles on technical and mechanical subjects are especially valuable to saw mill and planing mill men and manufacturers of lumber products.

☞ Subscription price for the two editions or one year, $1.00.

WANTED AND FOR SALE

Advertisements will be inserted in this department at the rate of 15 cents per line each insertion. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed. This notice shows the width of the line and is set in Nonpareil type; 12 lines make one inch. Advertisements must be received not later than 4 o'clock p.m. on Tuesday to insure insertion in the current week's issue.

FOR SALE.—36 in. Wickes Gang, cutting 14 in. deep; located in Canada; price low. WICKES BROS., Saginaw, Mich.

WANTED—500,000 split cedar shingles. Quote price F.O.B. nearest shipping port. Address, HORWOOD LUMBER CO., St. John's, Newfoundland.

HAVE YOU ANY STOCK WHICH YOU WISH to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address, CANADA LUMBERMAN,

FOR SALE—SAW AND SHINGLE MILL, with stock of logs, also a comfortable dwelling and stables in connection. Near the Canada Atlantic Railway. This is a snap for cash, write for particulars.
D. A. RANKINS.
Falding Ont.

FOR SALE.

SAW AND PLANING MILL COMBINED, AT Acton, Ont.; well equipped and machinery in perfect order. Plenty of timber with which to operate for many years; wood business in connection. Business well established and profitable. For further particulars and terms apply to the proprietor.
JAMES BROWN,
Acton, Ont.

WANTED—A COMPETENT MAN, QUALIfied to take charge of a Handle and Wood Turning Factory. Address BOX 307, LUMBERMAN.

FOR SALE.

CEDAR SHINGLES, XXX AND XX; ALSO cedar posts. For particulars address, HARRISON & HAWKE, Shallow Lake, Ont.

FOR SALE.

400 M FEET HARD MAPLE, 100 M FEET B. Ash, and 50 M feet Red Birch. Will cut to order, summer delivery. T. H. DECEW & SONS, Fenelon Falls, Ont.

FOR SALE OR TO LET.

PREMISES OF ONE OF THE OLDEST ESTablished Lumber Yards in Hamilton, situated on York Street. Apply to JOHN THOMSON, George St., Hamilton.

FOR SALE

A FEW SPARS OF DIFFERENT LENGTHS up to 90 feet; also a small quantity of dry 2 and 1½ inch good soft pine. W. A. MILNE, Brown's Corners, Ont.

SAW MILL FOR SALE.

EQUIPPED WITH BAND MILL, SHINgle Mill and Lath Machine; capacity 35 M per day, with contract on hand for two years; can be renewed when runs out. Ship by water and rail. Address BOX 555, CANADA LUMBERMAN.

FOR SALE.

Large Tract of Timber

THE PRORERTY OF

The Canadian Land and Immigration Company of Haliburton, (Limited).

This company has a larger tract of well timbered land about 125 miles north-east of Toronto. There are large quantities of Cedar, Hemlock, Spruce, Balsam, Basswood, Beech, Cherry Birch, Maple, also considerable Pine, Elm and Ash on this tract. It is well served by two railroads, one of which is about to be extended through the centre of the property. The company are prepared to sell this timber in blocks ranging from 5,000 to 10,000 acres, or more if desired.

There are several good mill sites on the property. This would be a good opportunity for parties who are at present cut out and are looking for a new location.

Maps and plans and further particulars can be had by applying to

W. H. LOCKHART GORDON,
Managing Director,
157 Bay Street, Toronto.

CURRENT TRADE CONDITIONS.

ONTARIO.

The lumber trade for the month of January has been of satisfactory volume. While it could not be called active, the demand has been sufficient to call for a considerable quantity of lumber, and to indicate that the stocks of retail dealers and consumers have become somewhat depleted. The prospect is that there will be a liberal spring trade. The figures regarding the production and stock of pine lumber submitted at the annual meeting of the Ontario Lumbermen's Association, and published in the report thereof, are of peculiar interest to the trade. The total production in the Georgian Bay district last year was 476,000,000 feet, an increase of 125,000,000 feet over the previous year. The stock on hand December 31st last was 216,000,000 feet, as against 120,000,000 feet one year ago. Of this stock 92,000,000 feet had already been contracted for, leaving but 124,000,000 feet of unsold lumber at the mills. This is less than the increased production of 1900, and indicates the extent of the demand during last year. When it is considered that at the close of 1896 the stock of lumber at Georgian Bay mills was over 400,000,000 feet, it will readily be seen that the present supply is not large. The decreased production in Michigan is also a factor to be reckoned with. The estimated production of pine lumber in the Georgian Bay district this year is 500,000,000 feet, but in the Ottawa valley a decreased cut is looked for. Operations in hardwoods are on a very limited scale. The statement was made at the meeting in Toronto that the output this season would not exceed one-half that of last year. Some manufacturers are taking out no hardwood logs this winter. The production of hemlock will also be curtailed. The above facts lead to the conclusion that the lumber market is in a healthy condition, and that the demand is likely to be sufficient to consume the entire supply.

QUEBEC AND NEW BRUNSWICK.

The situation in respect to export trad has not changed, and as far as can be learned the shippers on this side have purchased a much smaller quantity of stock than usual, as they have been unable to close contracts with British importers. The local demand is a little more active, as dealers are commencing to stock up for the spring trade. The reconstruction of burned buildings in Montreal will call for a considerable quantity of lumber. Cedar shingles are firm, but the demand is light. Stocks are small, and with a more active demand prices would be likely to advance. Extra cedars are quoted, on Boston rate of freight, at $2.75 to $2.80, clear at $2.50 to $2.60, and second clear at $2.00 to $2.10.

GREAT BRITAIN.

The position of the British market is practically unchanged. Importers are still holding off, and the opinion seems to be that the prices which shippers are asking are higher than the conditions of trade will warrant. The consumption of lumber is of average volume, and the outlook for the year is of a satisfactory character, but the tendency of prices seems to be downward, particularly for the smaller sizes. Spruce deals in 11-inch widths are in good demand, but this is not the case with the narrow widths. One report states that within the next two months the price of battens, of which there is a large stock, is likely to decline from ten to twenty shillings per standard. At a recent London sale third quality Quebec spruce, 3 x 9-11 inch, sold at £9 15s per standard, and 2 x 9-12 inch at £12 6s.

UNITED STATES.

The developments in the United States lumber market during the past week have been of a decidedly favorable character. Eastern dealers visited producing points and made considerable purchases of lumber for shipment when navigation opens. The opinion is that while lumber prices may not advance to any extent, there is not likely to be any weakening. The stocks of pine lumber at Tonawanda show a decrease of 20 per cent. as compared with those of one year ago. The eastern trade seems to be quite promising, a heavy demand for building material being looked for. At Buffalo there is a scarcity of the higher grades of pine and of 10 and 12 inch boards in almost all grades. The demand for hardwoods is more encouraging. White ash is being purchased by agricultural implement manufacturers, there is a better condition in the maple trade, and basswood appears to be gaining strength. It is expected that with a larger demand prices will stiffen. Shingles and lath are strong, with a fair demand. It has been predicted that lath prices will be very much higher within the next ninety days.

The ship Alsterthal sailed from Moodyville last week for Valparaiso, Chili, with 1,467,071 feet of rough lumber, valued at $14,000.

The bark Brookside sailed from Digby, N. S., on January 31st for Buenus Ayres, with 700,000 feet of lumber, shipped by Harry Crowe, of Bridgetown. The bark Ethel Clarke sailed from same port for Cuba, with lumber shipped by Clarke Bros.

At an auction sale held by Foy, Morgan & Company, London, England, on January 16th, birch timber from Montreal sold at the following prices: 8 logs, 18 to 23 inch, 10 to 15 feet long, 80s per load of 50 cubic feet; 60 logs, 18 to 23 inch, 10 to 17 feet, 80s; 7 logs, 19 to 28 in., 10 to 15 ft. long, 87s 6d; 16 logs, 15¼-19 in., 9 to 15 ft., 70s; 16 logs, 15½-20½ in., 10-16 ft., 72s 6d; 16 logs, 15½-23 in., 11 to 14 ft., 72s 6d.

FOR SALE! FREEHOLD PULP WOOD LANDS AND TIMBER LIMITS

About 85,000 acres of Freehold Lands, all within 50 miles and west of the City of Quebec, along the lines of the Grand Trunk and Intercolonial Railways.

All pulp wood can also be delivered by rail or driven by water to the River St. Lawrence and shipped thence by boat.

These lands are most favorably situated as regards low rates or railway freight to all points reached by above mentioned railways and their connections.

Also 217 square miles of limits on the North Shore of the River St. Lawrence, below Quebec, and 155 square miles, the logs on which latter limits would go to the Bay des Chaleurs by the Restigouche River.

ADVANCES MADE TO SHIPPERS.

Qu'Appelle valley, north of Regina, and is still a large tree in the valley of the Red Deer river flowing into Lake Winnipegosis.

By the foregoing it will be seen that maple and beech do not reach Manitoba, and that basswood is sparingly found in that province, on the first prairie steppe. Elm, oak, and red or green ash, extend well across the second prairie steppe, but do not ascend to the third prairie steppe. Tamarack is abundant in a swamp near Brandon, and spruce is occasionally met with in the sandhills in that vicinity.

Twenty years ago the Cypress Hills at their eastern end were covered with fine aspen and balsam-poplar, white spruce, and some canoe birch. On the western end of the hills where the elevation rose to over 3,500 feet there were large quantities of lodge pole pine, which is abundant in the Rocky Mountains. In the valley of the South Saskatchewan there were many cottonwoods, and these extend all the way up to the foothills in all the tributaries. At Lethbridge two species of poplar are found that are peculiar to that part of Alberta and Montana. These are the only species of trees found on the third prairie steppe.

The reforesting of that part of Manitoba included in the first prairie steppe, with spruce, various species of poplar, elm, Manitoba maple, over-cup oak, tamarack, and green ash, will be a very simple matter, as all the above species of trees flourish there now. The chief drawback in parts of Manitoba is the presence of sodiac salts in superabundance in the soil, but local knowledge will soon overcome this difficulty.

A rise of a few hundred feet brings us to the second prairie steppe, which with increased elevation becomes drier and less wooded and hence more difficult to reclothe with forest. Much of the country between Brandon and Indian Head, including Brandon Hills, the Oak Lake District, around Fort Ellice, and south of Indian Head and north to the Touchwood Hills, was within the last forty years covered with heavy forests of aspen and balsam-poplar, with oak in the sandy tracts. This region will also soon become largely forest again, if care be taken to keep out fires and protect the young growth. For 400 miles west of Winnipeg there is no reason why the whole land should not produce trees. Neither climate nor altitude is against them, and if the trees of the country are used, with certain species of Russian poplar, there can be no failure.

After passing Moose Jaw, on the Canadian Pacific Railway, we ascend to the third prairie steppe, and here the conditions change at once. The rainfall is lighter and the altitude has increased so much that fewer species are available and less ground is suited for present tree culture. Owing to the light rainfall and certain peculiarties of soil, trees would not succeed in many locations, but by the aid of windbreaks to catch the snow and by judiciously damming all the water courses, those which dry up during the summer as well as those that have permanent water, large reservoirs of water could be held that would irrigate considerable areas. On all sides of the Cypress Hills perennial streams descend to the plain, chiefly over gentle slopes, and these streams could, at little expense, be made to irrigate large areas for wheat growing; they would also serve to create a central forest that would change the climate over a large area and very much improve the whole country as far east as Regina. Enough water falls over this region, if only conserved, to reforest where necessary and make farming profitable. It is only necessary to mention that in Alberta irrigation over large area has begun, and besides the pioneer ditch at Calgary, the St. Mary's canal from the boundary to Lethbridge will revolutionize an extensive district in Southern Alberta, and grain areas and forest belts will be scattered all over this region.

HOW TO REFOREST THE PRAIRIE.—The reforesting of the whole country from Winnipeg to Moose Jaw is only a matter of detail. There are no climatic conditions to be overcome, and trees or seeds suitable for planting or growing can at once be obtained in necessary quantities. It is not my purpose to give advice in this matter, but only to indicate the lines in which, in my opinion, success lies. The trees of the country alone should be used at the start; experimenting with recommended species and varieties should be shunned. Manitoba Maple (Negundo Aceroides), Cottonwood (Populus monolifera), Balsam Poplar (Populus Balsamifera), Aspen Poplar (Populus Tremuloides)—these four trees with a judicious sprinkling of known hardy conifers, birches and Russian poplar, will be quite sufficient for all purposes.

The ground should be thoroughly prepared as if for a wheat crop and laid out in drills far enough apart to suit the person making the venture. Then seed of the species should be sown in the drills and covered. If poplar of any kind be planted, all that is necessary is to lay down in the drills pieces of wood fresh cut, or better still, the surface roots of the poplars found growing in the neighborhood, and cover them up. If the soil is fairly damp these billits or roots will soon throw up shoots and a quick and strong growth will follow. If four farmers having lots adjoining each other would plant five acres of ground on adjoining corners, a block of twenty acres would be grown in one locality, and these groups scattered over the country would add much to its beauty as well as to its fertility.

On the third prairie steppe most of the trees spoken of above would be available, but the poplar and spruce would be the surest. Where water is not constantly available no attempt should be made, except where the soil is constantly moist, as in the vicinity of springs or dams made for the purpose. As soon as nuclei are established, more can be added as the moisture increases owing to the accumulation of snow caused by the windbreaks at these points.

Windbreaks for the gathering of snow in the winter in the young plantations could be grown by the planting of tall growing corn for that purpose.

Mr. R. F. Stupart, Director of the Meteorological Service of Toronto, followed with an address showing what part the chinook plays in forestry in Alberta. By means of some lantern views of weather maps he showed that the chinook has its main point of entry into the plains at a point near the international boundary. Its existence was a great barrier to tree growth. He pointed out that the difficulty of making the trees grow would be greater further west, and claimed that the rainfall and snow-fall was about the same in the prairie country as in the wooded country.

Mr. John Bertram said that he had no doubt as to the success of practical forestry. Forestry was no new thing, but had been practised by some lumbermen for a considerable time, and scientific men were now coming into line with practical observers. Fortunately, in Ontario the ownership of the land still remained with the Government, making it easier to apply forestry methods. He said that the State of Michigan was endeavoring to solve the problem of forestry, but under far less favorable circumstances than in Ontario. The area there fit for reforestation was about 4,000,000 acres, or 70 per cent. There are a great many gravel ridges and sand flats, and after cutting the timber the lumbermen had abandoned the land and fires had swept over it. There are no trees for miles, making it difficult to reforest. Regarding the growth of trees, Mr. Bertram said that the pine usually occupied the higher land, and did not seed more frequently than every three or four years. The trees that have flying seeds would reforest most quickly. The problem was how far will pine seeds fly. That the pine tree would out-grow the other varieties could be proven by an examination of a forest sixty or seventy years old, where the hardwood trees would be found to be dead. Mr. Bertram commended the Ontario Government in its action in setting aside forest reserves, and hoped that further steps towards securing a permanent forest supply would be taken.

In reply to a question Prof. Macoun said that the gall louse was destroying spruce trees in the east, and that tamarac in Algonquin Park was suffering from the same cause.

Some remarks relating to the scientific side of forestry were made by Mr. Gilchrist, who advocated that greater success would be obtained in reforestation by planting smaller trees.

Nr. Arthur Harvey said that he did not believe that deforestation had any effect upon the climate, but the climate might affect the growing of trees. He instanced Ireland, England, Quebec and even Ontario, where the climate had not changed as a result of the cutting away of the forest. He said that it took a longer period of moisture to start pine seeds to grow than was the case with hardwoods.

Mr. E. C. Jeffries, in a few remarks, advocated the establishment of a school of forestry by the provincial university, and Prof. Doherty, of the Royal Agricultural College, Guelph, referred briefly to the diseases with which trees are threatened. As a means of destroying the gall louse he said that spraying had been resorted to with very doubtful results.

Mr. Thomas Southworth, chief forester for Ontario, pointed out that the work of reforestation was really only commenced. The point had now been reached where a considerable expenditure of money was necessary in order to make the forest reserves profitable. He referred to the forthcoming meeting of the Canadian Forestry Association and to the conference upon forestry to be held in Kingston.

Mr. Aubrey White, Assistant Commissioner of Crown Lands, was called upon, but owing to the late hour declined the invitation to address the meeting.

THE LUMBERING INDUSTRY IN CANADA.

THE Labour Gazette for December, issued by the Department of Labour of the Dominion government, contains a lengthy review of the lumbering industry in Canada, under the following divisions: 1, Canada's Forest Areas; 2, Regulations Governing Lumber; 3, The Export Trade; 4, Conditions Affecting Employers; 5, Lumbering Methods; 6, Conditions Affecting Workmen. The last chapter contains much information of an interesting character which has not been published heretofore. It is stated that reports from every quarter go to show that, looked at from a wage-earner's point of view, the present is probably the most favorable period in the history of the lumbering industry. Wages have increased materially; there is a strong and general demand for men, and the standard of living provided by the lumbering companies has been raised. In next issue we may publish some of the statistics given.

CORRECTION.

SOME typographical errors occurred in the letter of Mr. J. D. Shier, on the relative merits of different saws, printed in last issue. Referring to the double band saw it was stated that "it will cut from ten to fifteen thousand feet in an hour more than a single band, and will not make shaky lumber." This should have read "it will cut from ten to fifteen thousand feet in a tour more than a single band and will not make snaky lumber," atour, of course, usually representing 10½ hours. A similar error occurred in Mr. Shier's reference to a gang saw, the word "hour" being printed instead of "tour."

ANNUAL MEETING OF ONTARIO LUMBERMEN.

THE annual meeting of the Lumbermen's Association of Ontario was held at McConkey's Restaurant, Toronto, on Tuesday, January 29th. The business session was preceded by a luncheon tendered by the President and Board of Management, which was of excellent character and much enjoyed. The chair was occupied by the president, Mr. John Waldie.

Those in attendance included: Messrs. John Waldie, Toronto, president; Hon. E. J. Davis, Commissioner of Crown Lands, Toronto; Aubrey White, Assistant Commissioner Toronto; D. Miller, Manager Merchants Bank, Toronto; Robert Watt, Wiarton, second vice-president; W.B. Tindall, Toronto, secretary; John Bertram, Toronto; W. A. Charlton, M. P. P., Toronto; N. Dyment, Barrie; W. T. Toner, Collingwood; R. Laidlaw, Toronto; George Thompson, Goderich; Hon. John Charlton, M. P., Lyndoch; Thomas Charlton, Tonawanda; R. Cook, South River; D. L. White jr., Midland; Mossom Boyd, Bobcaygeon; J. T. Conlon, Thorold; J. L. Hotchkiss, Victoria Harbor; C. Beck, Penetanguishene; A. A. Wright, Toronto; W. Laking, Hamilton.

At the conclusion of the luncheon the health of "The King" was proposed by the president and drunk, also that of the "Ontario Government." Responses to the latter toast were made by Hon. Mr. Davis and Mr. Aubrey White. Mr. Davis referred to the importance of the lumber industry. He said the history of the province owed much to the lumbermen. It must be recognized that the clause prohibiting the export of saw logs has been of great advantage to the province. When this legislation was enacted the time seemed to be fully ripe for such a step. Mr. Davis spoke briefly regarding the difficulties that were being encountered with settlers in districts where lumbermen were operating. He appealed to the lumbermen to assist the Government as far as possible in avoiding trouble with the settlers.

Mr. White also spoke of the obstacles that had arisen in regard to settlement. The interests of the lumbermen should not be sacrificed, but the opening up of the country was the paramount interest.

The toast of "The Lumbering Industry of Ontario" was proposed by Mr. Robert Watt. Hon. John Charlton, in responding, suggested that action should be taken by the association and by the lumber interests of Canada to secure the imposition of an import duty on United States lumber. He thought it was but proper that our Government should impose duties corresponding to those imposed by the United States. In 1899, he said, the importation of United States lumber amounted in value to $3,000,000, while last year it was still greater.

The business of the meeting, was then commenced. The secretary read the minutes of the last meeting and the financial report, which were adopted.

The address of the president was then read, as follows:

PRESIDENT'S ADDRESS.

The Lumbermen's Association of Ontario, which meets to-day, is not an organization conducted on purely selfish lines, but rather one that looks forward to placing the industry of the manufacture of our forest products in a position to assist in the upbuilding of the whole country. With this end in view, we organized and supported the movement which brought about legislation that all logs taken from lands under license from the Crown should be sawn in Canada, and it was one which has resulted in the greatest good to the greatest number. The workman's wage from the tree to the car has improved. Not a single machine shop from Ottawa to Sarnia but has had increased work supplied, giving reasonable profits divided amongst all trades, as mills which were rotting down are now employing men and using supplies and machinery.

The year 1899 was, and will continue to be, a banner year to lumbermen. The stock at the mills, the product of the low prices prevailing in 1898 and previous years for labor and supplies, gave a low cost, and the active demand and real scarcity forced prices to the highest point at the end of the year. When stock-taking arrived a year ago, the balance of profit was not only satisfactory to the operator, but to his banker who had looked upon the manufacturing conditions as endangering the trade with the United States. We are glad to say all those fears have passed away. The year 1900, while reasonably profitable, does not show such good results, owing to the enhanced cost of production and to a higher price for stumpage where this had to be purchased, but on the whole the result was satisfactory.

We enter the new year and a new century with a very limited stock of sawn lumber to meet the ever increasing local and foreign demand, and for the next six months, at least, there need be no drop in prices.

Owing to the advance in wages and supplies we need not look for a profit in the future such as the past two years has given us. Others are now sharing in the prosperity. Wages in the woods have advanced in two years from $16.00 to $26.00 a month, with board. This is 60% advance. Supplies have shared the general advance, and the farmer who pays more for his lumber to-day gets it back from the lumbermen in the higher prices current to-day for bacon, butter and horses.

To illustrate: A lumber company purchased two carloads—say 30 horses—in 1897 at any average of $65.00 each. The same company bought two carloads—say 30 horses—within the past three months, and the average cost was $135.00 per horse, and the woods foreman pronounced the purchase at the low price as the best horses.

Lumbermen have always been free distributors of money, and as another result of the manufacturing condition attached to the business, it has elevated the people of Ontario in the eyes of our neighbors and strengthened the sentiment of national self-reliance amongst our people. We must continue to insist that our Dominion Government shall adopt a tariff against lumber and all wood products entering into competition, remove them from the free list, and relieve the lumber industry from the unequal competition of lumber manufactured and freighted under more favorable conditions. To-day, labor, machinery and mill supplies are higher in Canada than in the United States, and when low transportation rates on lumber are given from the Southern States, we in Ontario are placed in competition with the cheap colored labor of the south; and lumbermen in New Ontario and British Columbia are at a disadvantage when competing with Oregon and Washington Territory for the trade of our Prairie Province. The advantages given and favors shown by the whole country to Manitoba while a young and struggling Province, are surely entitled to consideration, and that province now being of age, may fairly be asked to accept the general policy of the government equally with the other provinces.

Ontario industries are paying a million dollars a year by way of a duty on soft coal, which is a tax local in its application owing to distance from our coal mines, and this tax is either for revenue or the protection and advantage of the coal industry of Nova Scotia and Cape Breton. So that if Manitoba should pay a tax on a portion of her lumber consumption, it is only fair, and it is an eror to suppose that Manitoba alone would pay the duty on lumber, as to-day Ontario imports lumber as extensively as the west.

The railway facilities afforded to the lumber trade have not kept pace with the improvement for transportation in other directions. Old light capacity flat cars are too often all we get, and even those too frequently during our busiest season are largely withdrawn to be used for ballasting the roadbed of the railway, and the box cars are withdrawn for grain when that trade demands. We would urge upon the railways the need there is for an increase of their stock of large and heavy flat cars.

The difference in freight rates charged between hardwood of the same value as pine and pine lumber, which the hardwood section urged this association to try and get removed, has been accomplished. The Freight Agents' Association, with their usual foresight, saw the unfairness (and their opportunity at the same time), and they "raised the rate on pine." There have been, since the advance in lumber, relative advances in freights, so that to-day contractors for the public works of Canada find it to their advantage to purchase hemlock in the United States, and for pine they largely use the pitch pine of the south. Even in these good times lumber will not stand a freight rate of $4.00 per M feet from mill to consumer, with prices of Canadian stumpage, labor and supplies brought into competition with cheap labor and stumpage in the Southern States. Twenty years ago the Northern Railway carried lumber into Toronto at $1.00 per M feet, and the old Midland Railway did the same to Port Hope. To-day the average is over $2.00 per M feet. Rates have been steadily advanced on lumber as well as other lines, and the tendency of railway management in this new century, with the large accumulation of wealth in few hands, used not for benefitting mankind, but in the absorbing of transportation companies, so as to make those who are rich richer, by increasing freight rates to the highest point the traffic will stand, will in the end be met with an outburst of socialism, to the injury of all. We believe this can be averted in Canada if our Dominion and Provincial governments stop granting subsidies to promoters for the purpose of building railroads to open up the country. Let the governments, both Provincial and Dominion, build and own the roads the same as the municipalities do the highways. Let transportation companies operate on terms to be agreed upon, either by allowing a portion of the gross earnings to go to the governments, or on some other terms to be adopted; in each case the people owning the road, through their representative, will have a say. This will come, and whether through a Ross, a Whitney, a Laurier or the yet unknown, the man who has courage to adopt it will be considered a patriot and a statesman.

In this period of combines and monopolies this association is to be congratulated that no effort has been made by them with a view to raise prices, but have contented themselves with the market price given them by the ordinary law of supply and demand.

We are pleased to notice that the Ontario Government have taken up the subject of perpetuating the white pine lumber industry by a system of reforesting and fire-ranging. Our own observations confirm those of the government officers, that pine follows pine, and where soil is good the growth of young pine is from 1½" to 3" increase in diameter in 10 years. These measurements were taken from trees 8 to 13 inches in diameter. We hope all lumbermen will heartily co-operate with the government by leaving all healthy young trees standing where too small for logs, instead of stripping the ground as some do.

The secretary presented the following statistical report:

STATISTICAL REPORT.

I beg to submit herewith the following ssatistical information, based upon the best replies received to circular letter of January 12th, 1901:—

PRODUCTION—WHITE PINE LUMBER:

The total production of mills in north-western Ontario, embracing all mills on Georgian Bay, northern division of Grand Trunk Railway to Callender, and C. P. R., North Bay to Rat Portage:

Total quantity produced, 1900.....	476,000,000 ft.
" " 1899.....	351,000,000 ft.
Increase.....	125,000,000 ft.
The decrease in production of mills in Saginaw Valley and Lake Huron shore of Michigan hitherto supplied by Canadian logs.....	92,282,000 ft.
Net increase.....	32,718,000 ft.

entering into market usually supplied by these mills.

The decrease of United States mills in the north-west district of Michigan, Wisconsin and Minnesota, which competes in the same market for 1900, was 478,603,000 feet.

STOCKS ON HAND—WHITE PINE LUMBER, PRINCIPALLY :

On hand Dec. 31, 1900	216,349,000 ft.
" " 1899	120,000,000 ft.
Increase for 1600	96,349,000 ft.
Of the stock on hand on Dec. 31, 1900, there was sold waiting delivery	92,109,000 ft.
Unsold	124,249,000 ft.
In the year 1896 the stock at mills in pile (exclusive of Rat Portage) was	406,000,000 ft.

EFFECT OF THESE FIGURES ON PRICES :

Taking into consideration the large decrease in the United States mills, and also the fact that the increase in production is offset by the reduction of the output of Michigan mills hitherto supplied by Canadian logs, one naturally comes to the conclusion that workings of the law of supply and demand should tend to a maintaining of present prices firmly, if not an increase, particularly as it is likely that large demands on the source of supply referred to will be made from the English market.

TRADE OF 1901 :

In regard to the volume of next year's trade, the estimated production of 1901 is	501,900,000 ft.
The production of 1900	476,000,000 ft.
Increase	25,900,000 ft.

The following figures are given of the volume of trade in the United States :

NORTH WESTERN MILLS :

The highest year was 1892, the production being 8,594,222,802 feet.

For the years	Production.	Stocks on hand.
1896	5,725,763,035	4,053,937,435
1899	6,056,508,000	2,728,271,000
1900	5,485,261,000	2,839,705,000

In regard to the hardwood trade, the information I have received is imperfect and not full enough to compile any figures that would be a guide.

W. B. TINDALL, Secretary.

Mr. Bertram complimented the president upon his able address, stating that he was particularly interested in his reference to tbe forestry problem. It seemed to him that lumbermen should take an interest in the perpetuation of their own business. His observations had convinced him that if a sufficient quantity of pine timber was left standing to seed the country, pine would invariably grow, although the first growth was usually poplar and white birch. He urged his confreres to give attention to the preservation of the young pine. He was also in favor of an import duty on United States lumber, contending that the conditions between the two countries should be equalized, and that Canadian lumbermen should be given fair play. Our lumbermen, he said, were not afraid of competition, but they should be allowed to sell their product in the United States if the manufacturers there were allowed free entry into the Canadian market.

Mr. Dyment said that he was strongly in favor of a duty on the American product. He had found great difficulty in shipping lumber to the United States at a profit.

Mr. J. T. Conlon also spoke on the duty question, urging the lumbermen to take a fair stand. He said they were not asking it as a matter of protection, but as a matter of equal rights.

The suggestions in the president's address regarding forestry and an import duty on lumber also met the views of Mr. W. A. Charlton, M.P.P. He had been an observer of forestry matters, and was certain that pine would grow after pine. The poplar and white birch to which Mr. Bertram referred were peculiar to the northern districts. On the Moose river he had found sufficient small pine to reforest the land. Mr. Charlton strongly urged the employment of a greater number of fire rangers as an effective means of protecting the forests.

Messrs. M. Boyd, Robert Watt, C. Beck, William Laking, W. T. Toner, and Hon. John Charlton also spoke in sympathy with the movement to secure an import duty on lumber. Mr. Charlton said that the justification of the policy is that it would be an advantage to the country and give us proper protection. He pointed out that Canada buys three times as much from the United States people as she sells to them.

Mr. Bertram said that heretofore the lumbermen had not been organized in Canada to cut hemlock bill stuff ; it had been taken out by the farmers and cut at small local mills. The situation was changing. The lumbermen find that on their land they have large quantities of hemlock, and if the United States hemlock was kept out of the Canadian market, it would be found profitable for Canadian lumbermen to manufacture the hemlock on their berths.

The following resolution was then submitted to the meeting :

"Moved by Hon. John Charlton, seconded by M. Boyd, that the address of the President be adopted by the Association and a copy forwarded to the Dominion and Provincial authorities and that the president be instructed to adopt such a course as he thinks fit to have a duty placed on lumber coming into Canada."

This resolution was unanimously adopted.

The election of officers resulted in the re-election Mr. John Waldie as president and Mr. James Scott as 1st vice-president. Mr. N. Dyment, of Barrie, was chosen as 2nd vice-president, and the following as the executive committee : D.L. White, jr., Midland; John Bertram, Toronto; W. A. Charlton, Toronto ; J. B. Miller, Toronto ; Robt. Laidlaw, Toronto ; C. Beck, Penetang ; R. Watt, Wiarton ; J. T. Conlon, Thorold.

The question of the number of hours which mill employees should work was brought up. On the south shore of the Georgian Bay it is ten and one-half hours, and on the north shore eleven hours. The opinion of the meeting was that it is a question which must be governed by local conditions.

Mr. J. L. Hotchkiss was introduced to the meeting as an American who had come to reside in Canada. Mr. Hotchkiss has assumed the management of the lumber interests of Pitts & Charlton at Victoria Harbor. He stated that the resolution which had been adopted in favor of an import duty on lumber was one which appealed to him as proper. He did not think that the interests of the inhabitants of Manitoba would suffer thereby, as there was an immense supply of timber tributary to the Rainy river which could be drawn upon.

Before adjourning the members were addressed by the president and secretary of the Canadian Manufacturers' Association, inviting the association to join that organization. The matter was left to the executive committee.

SOME USES FOR OLD FILES. — There are many uses to which old files can be put. A good flat scraper can be made from a flat file, a half round scraper from a half round file, and from a three cornered file a good centre scrape can be made for use in scraping centre of work in order to make them run true. Drill drifts, cutters for arbors, etc., can also be made. When it is desired to remove a pipe nipple that has been broken off close to the threads, grind the corners of a square file sharp and drive down into the broken nipple. Unless it is rusted in very tight, it can be unscrewed. Broken cap screws can be removed this way, first drilling in hole for the file.

THE USE OF EMERY WHEEL.

The following advice to users of emery wheels by one of the largest emery wheel headquarters will be of interest to many. Too great a variety of work should not be expected from one grade of wheel. If the amount of grinding will warrant it, several grades can be profitably employed, each carefully selected for its particular purpose. Wheels should be kept perfectly true and in balance. In order that they may not become in the least out of true an emery wheel dresser should be used to dress up the wheels a little each day, or as often as they require it.

In mounting emery wheels never crowd them upon the arbor. Use flanges at least one-third the diameter of the wheel. Flanges should always be concaved and fitted with rubber washers between the flange and wheel. Have wheels slip easily on the arbor and screw flanges only tight enough to prevent wheels from slipping. Stands on which wheels are mounted should be heavy and strong, and solidly bolted to a firm foundation. Keep machine well oiled, so that arbor will not become heated, otherwise there is danger of wheels breaking from expansion of arbor.

Users of wheels are particularly cautioned not to run wheels on shaky machines, or on machines in which the arbors have become loose in the boxes from wear. See that rests are properly adjusted in relation to the wheel, otherwise accidents may occur owing to work being drawn between the wheel and the rest. Never run wheels at a higher speed than the maker recommends. Don't try to grind malleable iron with a wheel that was made for brass, as no one wheel can be made which will be just wright for grinding all kinds of metals.

To obtain the best results, emery and corundum wheels should he run at a surface speed of 5,500 feet per minute. Wheels, if run too fast, will heat the work and glaze, and if run too slowly will wear away rapidly and do but little work. The same speed should be maintained as the wheel wears down, and the speed of the spindle should be increased correspondingly as the diameter of the wheel is decreased. Where there is a different amount of grinding to warrant the use of more than one machine, this can be accomplished by transferring from the first or larger grinder to smaller ones as the wheels wear down, otherwise by means of cone pulleys.

SAVE YOUR OLD FILES.

The Globe File Mfg. Company, Port Hope, have recently added to their large manufactory a re-cutting department, which will enable them to re-cut and make equal to new promptly, files of any make or size at low prices. They have a special price list for this work which they will mail to any large consumer of files on application. The output of their factory is 600 dozen new files daily, which are shipped from Halifax, N. S., to Victoria, B. C.

The current (January) issue of the International Monthly, published at Burlington, Vt., is one of unusual interest. Emile Reich, of London, writes on "England at the Close of the XIX Century." He gives a comparative and most interesting study of the true status of Britain's interests, military and diplomatic. Bernard Bosanquet, of London, writes on "The English People" : Notes on National Characteristics," the first of a most interesting series of papers on the national characteristics of the greater nations. Prof. Geikie, of Edinburgh, the geologist, describes "Mountain Structure and Its Origin." Dr. F. H. Williams, of Boston, writes on "The X Rays in Medicine," Herbert Putnam, Librarian of Congress, on "The Public Library in the United States."

WOOD PULP DEPARTMENT

COST OF PRODUCING SULPHITE PULP.

A meeting of the sulphite pulp manufacturers of Canada and the United States was held in Boston on December 28th last. Those present included Messrs. M. F. Mooney, of the St. John Sulphite Pulp Company, St. John, N.B.; P. V. Gascoigne, of the Laurentide Pulp Company, Grand Mere, Que.; and Chas. Riordan and George E. Challes, of the Riordan Pulp and Paper Mills. A question under discussion was the cost of producing sulphite pulp. Figures were submitted representing the cost of three sulphite pulp mills that were built in localities with advantages in the manufacturer's favor, and the figures went over $10,000 per ton of production. Two of the mills cost $300,000, and the daily production of each was 30 tons. An estimate is as follows: 2¼ cords of wood at $6 per cord, $13.50; coal, $3; sulphur, $3.30; lime, 70 cents; labor and salary in office, $7; wear and tear, $2.50. These figures are based on the cost for manufacturing a ton of pulp, and do not include insurance, interest, taxes, freight or commissions for selling pulp, and yet they show a total cost of $30 per ton.

The Sulphite Pulp Manufacturers' Association represents a daily production of 650 tons of pulp, only 50 tons being made by manufacturers not represented in the Association.

INCREASED PRODUCTION OF SULPHITE PULP.

"A prominent sulphite manufacturer who has been collecting data concerning new sulphite mills now in course of construction, figures that there is going to be a surplus on hand in America by June, 1901," says the Paper Mill. "It is estimated that within the next six months there will come into the American market from new plants now building, and not counting the proposed increases in capacities of the mills at present engaged in making sulphite, 370 tons of sulphite pulp. This increased production is divided up as follows: Malone Paper Company, Malone, N.Y., 10 tons; Avalomink Paper Company, Minsi, Pa., 10; Jefferson Paper Company, Carthage, N.Y., 30; Gould Paper Company, Lyons Falls, N.Y., 30; Traders' Paper Company, Lockport, N. Y., 20; Cushing Sulphite Fibre Company, St. John, New Brunswick, 50; J. Henry & Sons, Lincoln, Me., 30; St. Regis Paper Company, Great Bend, N.Y., 40.

"This list, representing 220 tons, shows the new plants which will be in operation by January, 1901. The St. Regis pulp is to be sold outside until April or May, when it is expected the paper mill will begin to run. But even then it is not expected that the paper mill will use all the sulphite product, and it is thought to be the intention of the St. Regis management to supply the felts mills and Taggart's plants with the surplus.

"Between January and June, 1901, the following plants will begin operations:—Sault Ste. Marie Pulp and Paper Company, Sault Ste. Marie, Ont., 60 tons; Bayliss Mill, Williamsport, Pa., 30 tons. To this list is to be added several new mills in the Fox River Valley, which some time between now and June 1 will add 60 tons to the grand total.

"There is little foreign sulphite imported today. Probably 10 tons a day would cover the amount coming in on contracts. During the boom last fall as high as 100 to 150 tons per day were imported.

"It is thought unlikely that even with a greatly increased consumption and the substitution of American pulp for the foreign article, that the domestic demand will be able to care for the increased production."

BEATING WOOD PULP.

Of all pulps wood is perhaps one of the most susceptible to altered manipulation in the beaters, though the chemical processes necessarily have much to do with its properties, says the Paper Maker (England). Sulphite pulp can be beaten to produce a paper exhibiting the high breaking strength of a rag paper, with an almost equal amount of expansion. This does not mean that the best rag papers can be equalled by sulphite, but that experienced and careful beating will materially affect the strength of the fibre. It is well known that wood pulp may be made tough and strong, or soft and porous, capable of being used as a substitute more or less for cotton and linen, and, on the other hand, for suitable the uses of esparto in the manufacture of art papers. The most striking point of difference between rag pulp and sulphite is the resistance to crumpling—a very important quality. Sulphite pulp, even when exbibiting the highest possible breaking strain, is brittle and unable to withstand any extraordinary amount of friction. Rag pulp, on the contrary, is especially suitable for paper which may have to put up with rough handling. The brittleness of wood pulp cannot be greatly modified by the beating, as it is determined by the chemical treatment, and if too much attention is given to making the pulp soft the strength suffers accordingly. The question of adjustment of conditions thus bccomes a very delicate one. As far as the paper maker is concerned, his judgment is called into requisition to decide on the merits of various brands of pulp in order that the pulp most suitable for use may be selected. A raw material consisting of fibres of maximum length is easy to manipulate or to reduce to a given standard in the beater, while a softer pulp is not so capable of alteration, the fibre being already shortened by the chemical process.

Whatever may be the ultimate use of the pulp, its manipulation in the beater must be carried out intelligently. It should be a gradual process, the roll being let down on to the bedplate, not all at once, but bit by bit, so that for the first half hour or more the engine acts as a breaking machine. In this way the best qualities of the pulp are brought out and the fibres are drawn properly. The roll can then be lowered as much as may be necessary to reduce the pulp to a right consistency. For fine printings the rate of beating is important, as a fast speed gives the paper a mottled appearance, which is highly undesirable in this class of paper, and an evil peculiar to wood pulp. Seeing that wood is now being used as a substitute for all sorts of fibres, and that by careful treatment it may have imparted to it the qualities which at one time were thought to be the particular property of other pulps, it follows that the operations of beating cannot be effectively managed by any hard and fast routine, demanding, as it does, the highest skill in modifying the action of the

knives to suit the pulp on the one hand, and the paper on the other. There is no question that the marketable value of a paper depends very largely upon the proper manipulation of the pulp in the beater, in view of the fact that the strength, handle and bulk of the finished article are qualities best brought out by the beater man. It is obvious that careless treatment at this stage of the manufacture cannot be put right by the machine man.—The Paper Trade Journal.

PULP NOTES.

J. C. Wilson & Company are placing orders for machinery for their new pulp mill at St. Jerome, Que.

The Chicoutimi Pulp Company will have about 6,000 carloads of pulp ready for shipment to England early in the spring.

The Fraserville Pulp Company, of Fraserville, Que., will seek incorporation at the coming session of the provincial legislature.

It is stated on excellent authority that work on the proposed pulp mill at Grand Forks, B. C., will be commenced early in the spring.

The Ottawa Power & Manufacturing Company are expected to commence work in the spring on the building of a pulp mill on the company's property at the Chaudiere, Ottawa.

Mr. E. S. Jenison has been in consultation with American capitalists regarding the erection of pulp and paper mills at Port Arthur, the necessary power to be obtained from Kakabeka Falls.

The municipalities of Shipton and Danville, Que., on January 17th last granted a loan to Messrs. Angus & Whiteford, of Montreal, to asssist them in building a paper mill on the Nicolet river, near the town of Danville.

Messrs Crocker & Company, manufacturers of paper making machinery, of Pittsburg, Pa., are considering the establishment of a branch in Canada. One of their representatives recently visited Sherbrooke, Que., in this connection.

The St. John syndicate which has secured the Knight lumber property at Musquash, N. B., will erect a sulphite pulp mill and a paper mill, the latter for the manufacture of the higher grades of paper. Mr. H. H. McLean, of St. John, N. B., is acting for the company.

A meeting of the Keewatin Power Company was held in the city of Ottawa on January 10th, at which it was decided to proceed at once with the erection of pulp and paper mills at Rat Portage, Ont. The pulp mill will have a daily capacity of 100 tons, and the paper mill of 50 tons.

It has been necessary for pulp manufacturers in the northern and western part of New York state to secure a large part of their supply from Canada. This winter nearly 20,000 cords of spruce will be taken from the vicinity of Sherbrooke and Brompton Falls, Que. Of this 10,000 cords will be required for the Freidenburgh Falls Company, 5,200 cords for the Treadwell Pulp & Paper Company, and 3,000 cords for the Plattsburg Paper Mill & Bag Company.

The plans for the pulp mills of the Belgo-Canadian Pulp Company are now complete and provide for a plant with a daily capacity of 100 tons of ground wood pulp, 50 tons of bleached sulphite, and 100 tons of paper. The product will all be shipped to Brussels, 50 tons of the ground wood pulp being about 45 per cent. dry and 50 tons 88 per cent. dry, in sheets 24 by 36 inches and .012 inch thick. The work under contract now, and to be in operation not later than June 1st, 1901, is the ground wood mill, 64 by 270 feet, two storeys high ; boiler house, 50 by 64 feet, and shipping storehouse, 100 by 252 feet, one storey and basement, with two standard guage railroad tracks running through the centre, so the pulp can be loaded in the cars from one side and the paper from the other. The contract for the buildings was given to Mr. W. J. Hill, of Toronto, Ont., and that for the steel structural work and steel feeder to the Riter-Conley Manufacturing Co., Pittsburg, Pa., U.S.A. The special turbine wheels and feeder gates will be supplied by the Holyoke Machine Co., Holyoke, Mass.; the grinders, screens and wet machines by the Friction Pulley and Machine Works, Sandy Hill, N.Y.; the drying machines by the Black & Clawson Co., Hamilton, Ohio, and the boilers and steel chimney by the Sterling Co., Chicago., Ill. The contract of Mr. A. C. Rice, consulting engineer of Worcester, Mass., with the Belgo-Canadian Pulp Co. is to take the natural conditions of the location, furnish all plans and specifications, place all contracts, and build modern mills in every respect, with a complete organization to operate them.

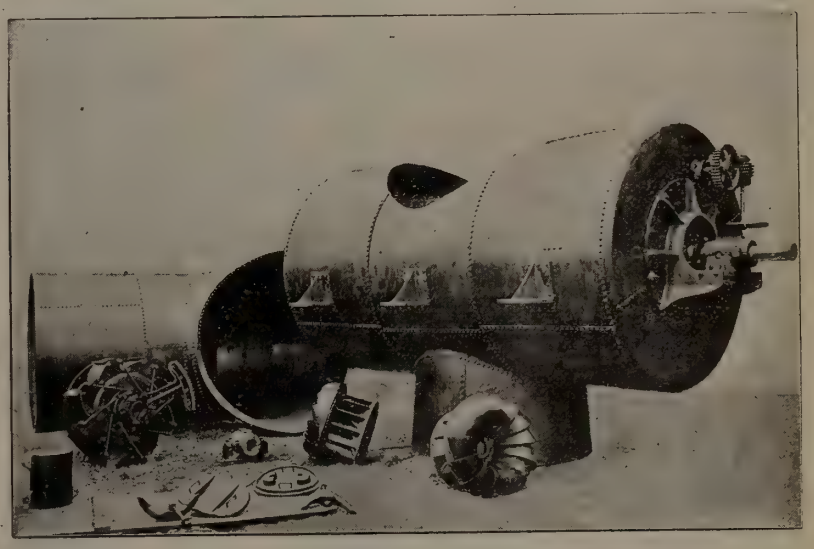
CORRESPONDENCE SOLICITED



THE above view shows one of the many styles of setting and case to which our
CROCKER PATENT TURBINE
may be adapted. This plant was built for direct connection to Wood Pulp Grinders.
We invite correspondence from those contemplating the erection of Ground Wood Mills. Estimates submitted for complete equipments.
Let us have your address and we will send you a copy of our new 1900 Turbine Catalogue, also circulars of the Port Henry Grinder, etc.
THE JENCKES MACHINE CO.
36-40 Lansdowne Street - SHERBROOKE, QUE.

THE NEWS

—A. J. Stepan is building a saw mill at Loring, Ont.

—D. Cote, of Otterburn, Man., has recently purchased a portable saw mill.

—Josiah Keane, of Fesserton, Ont., intends converting his saw mill into a stave mill.

—J. D. Shier, of Bracebridge, Ont., is enlarging his planing mill and wood working factory.

—Drake & Mackon, lumber merchants, Innisfail, N. W. T., have dissolved partnership, H. Drake continuing.

—Peter Nadeau, of Port Daniel Centre, Que., has in view the erection of another saw and shingle mill at Grand River.

—The Conger Lumber Company, of Parry Sound, Ont., are building a new brick engine house and putting in another boiler.

—The Rathbun Company are said to be negotiating for the purchase of the saw mill near Bancroft, Ont., owned by the Flint Estate.

—It is the intention of McNab & Ryan, of Cranbrook, B. C., to establish a saw mill at Jaffray, with a capacity of about 20,000 feet per day.

—D. C. Cameron, president of the Rat Portage Lumber Company, states that his company have definitely decided to build a large saw mill in Winnipeg.

—The settlers of the Lake Temagami district, in Northern Ontario, are receiving $2.25 to $2.50 per cord for their pulp wood delivered at the banks of the Blanche river.

—Incorporation is being asked for "The St. Lawrence Lloyds," for the purpose of carrying on an ocean and inland marine insurance business in competition with the Lloyds of London, Eng.

—For the first ten months of the year 1900 the exports from the United States to Germany reached in value $27,000,000. Of this lumber represented $1,213,479, and timber and manufactured wood $1,278,933.

—Dr. J. W. Good and P. W. Ireland, of Toronto, are interested in the Klondike Lumber and Fuel Co., now seeking incorporation. The head office will be in Winnipeg and the capital $100,000.

—Pelford & Townsend, of Leduc, N. W. T., have established a saw mill on the south west side of the Conjuring lake, 19 miles south west of Leduc. Lumber is being sold at the mill at $14 per thousand.

—Mr. Finger, of the lumber firm of Finger, Arpin & Scott, of Port Arthur, Ont., was in Toronto recently on business with the Ontario Government. It is understood that his firm are seeking to acquire additional timber limits.

—A new shingle cutting machine has been invented by Mr. Frank Johnstone, of the Pacific Coast Lumber Company, New Westminster, B.C. It is on a solid iron frame, with no woodwork attachments, as is the case with most of the shingle machines in use to day.

—The annual meeting of the National Wholesale Lumbermen's Association will be held in Pittsburg, Pa., on March 6th and 7th. The meeting promises to be an interesting one, as important questions affecting the lumber trade are to be brought up and discussed.

—The Ontario Government has decided to have a forestry exhibit at the forthcoming Pan-American Exposition at Buffalo. Special attention will be given to spruce suitable for pulp wood, and to hardwood for the manufacture of furniture. Mr. Thos. Southworth, clerk of forestry, visited Buffalo recently to make final arrangements.

—Sir Henry Joly de Lotbiniere, Lieutenant-Governor of British Columbia, has procured and sown in Victoria seeds of hardwood trees not native to British Columbia, such as butternut, black walnut, white and green ash, red oak, etc. He states that in British Columbia they are well supplied with soft wood trees, but need the hardwood species.

—The timber exports of England for the first ten months of 1900 had a total value of $105,700,000, against $92,500,000 for the same period of 1899, a gain of 14.3 per cent. The exports of lumber from the United States to England during the ten months show a gain of 41.4 per cent. over the previous year, while Canada increased her exports but 9.7 per cent.

—Ritchey & McDonald, of Makinak, Man., have purchased a saw mill plant from the Stuart-Arbuthnot Machinery Company, of Winnipeg, Man. The mill will have a capacity of about 30,000 feet per day. Manning & McClure, of Stonewall, Man., are putting in a saw mill plant in the Gimli district, Lake Winnipeg, having purchased the machinery from the same firm.

—Messrs John Nicholson and David Clark have purchased the veneer mill which for some time has been standing idle at Eugenia Falls, Ont. They will immediately put the mill in operation and manufacture veneers, heading blocks, staves, etc. Mr. Nicholson was for thirty years in the employ of the Gilmour Company, of Trenton. Mr. Clark was also in the employ of the same firm for about nineteen years.

—Action has been commenced to decide the ownership of Deadman's Island, adjoining the city of Vancouver, B. C. It will be remembered that Theodore Ludgate obtained a lease of the island from the Dominion government on which to build a mill. After work had been commenced the provincial government put forth a claim to the property involved, and as a result operations towards building the mill ceased. The injunction still stands, and now the matter of the title to the island is about to be adjudicated upon.

—The Pigeon River Lumber Company, composed of members of the firm of Arpin, Scott & Finger, of Grand Rapids, Wis., have purchased the saw mill and accessories of Graham, Horne & Company, at Fort William, Ont. They have also taken over the entire winter cut of logs of Graham, Horne &Company and the tugs and other property of the Lake Superior Tug Company. Graham, Horne & Company retain their logging outfit, with booms and chains complete, and also their standing pine. It is their intention to continue in business in Fort William, confining their operations chiefly to work in the woods.

—A dispatch from Grand Forks, B. C., states that the largest body of timber in that section, and probably one of the most important in British Columbia, occupies the valley of the north fork of Kettle river, north of that city. Commencing at Cedar creek is a cedar belt which extends for a distance of over fifty miles north in an almost unbroken body. The cedar is interspersed with merchantable tamarac and pine, and at the mouth of Franklin creek the white pine commences. This is of the same variety as the Michigan pine, and is abundant in the river valley for fifteen miles above the mouth of Franklin creek.

An American syndicate, represented by F. J. D. Barnjum, have acquired large timber areas in Cape Breton, and have commenced preliminary work preparatory to the erection of a large pulp mill on the North river, in Victoria county. The syndicate will be known as the North River Lumber & Pulp Company.

COVERING A SAND BELT.—Have good glue hot, says Louis Hurd, in the Blacksmith and Wheelwright, also have a 2½ inch flat brush; have the dry sand nearby; give the belt a good stiff coat of glue, then put on plenty of sand and set into the glue with a hand roller or hand block and pack it down. Do about 2 feet at a time. When done hang up to dry for a day or more.

PERSONAL.

Many readers of THE LUMBERMAN will regret to learn of the recent sudden death of Mrs. Ward, wife of Hon. J. K. Ward, of Montreal.

Mr. D. C. Cameron, manager of the Rat Portage Lumber Company, has been elected Mayor of Rat Portage by acclamation for the year 1901.

Mr. Alex. McCool, foreman for the Pembroke Lumber Company, has accepted a position with Booth & Gordon as manager of their mill at Cache Bay, Ont.

Mr. T. Whaley has resigned as manager of the Whaley Lumber Company, of Huntsville, Ont., and will retire from active business life, although continuing as president of the company.

Mr. Arthur D. Campbell has been appointed Canadian commercial agent in the Argentine Republic and Uraguay, to succeed Mr. D. M. Rennie, who resigned on account of ill health. Mr. Campbell's headquarters will be at Buenos Ayres.

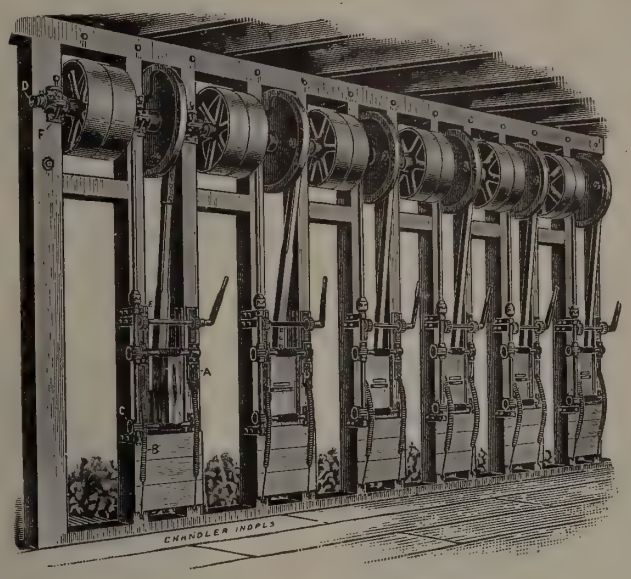
The sympathy of many friends has been extended to Mr. J. W. Maitland, of Maitland, Rixon & Co., lumber merchants, Owen Sound, Ont., upon the death of his eldest son, Mr. F. B. Maitland, which occurred on January 1, in his 21st year.

Mr. J. C. Shook, formerly of Toronto, and lately of British Columbia, has been appointed manager of the Dickson Company of Peterboro, as successor to the late T. G. Hazlett. Mr. Shook has had a large experience in the lumber business and is well qualified to assume the management of the important interests of the Dickson Company.

Mr. J. G. Scott, the well known lumberman, of New Westminster, while on a visit to eastern Canada recently received a telegram advising him of his re-election by acclamation as Mayor of New Westminster. This may be regarded as the highest possible testimonial to the value of the public services which Mr. Scott has rendered to his adopted city.

Mr. James G. Maclaren, son of Mr. David Maclaren, lumberman, of Ottawa, arrived home from South Africa last month. At the outbreak of the war he was employed in the lumber district at Johannesburg for the Lingham-Maclaren Trading Company, who also have lumber yards at Pretoria and Lorenzo Marquez. At Durban he enlisted in Methuen's Horse and served as a trooper for one year and eighteen days. Notwithstanding the dangerous duties in scouting and outpost work, Mr. Maclaren escaped injury.

The Best Excelsior Machine in the World



When two or more knives are run with one belt, all must stop when the belt is stopped to set bits or from any other cause. Our Machine has a belt for each knife, hence but one knife stops at a time. This great advantage should not be overlooked by purchasers. Time is money. Our Machine cuts more excelsior in a given time than any other machine. Get our circulars and prices.

The Wm. Hamilton Mfg. Co., Limited

Branch Office: VANCOUVER, B.C.

PETERBOROUGH, ONT.

R. H. SMITH CO., LIMITED

St. Catharines, Ont.

We are the Sole Manufacturers of Saws under the **Simonds' Process** in the Dominion of Canada.

There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. **All such Claims are FALSE,** as the patentee in the U. S. and ourselves are the only firms in the world who use it.

MILL STREAM, QUE., on I. C. R'y, December 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—Driving a 20 in. 13 gauge saw into frozen hardwood, using a 9 in. 4-ply belt, if it can be done satisfactorily, is a very severe test. Your saws have stood that test better than any I have tried. I have been experimenting with different makes—both home and imported—during the last five years, and give yours the preference. Last order is just to hand and will report on them by and bye.

Yours very truly, JAMES McKINLAY.

CAMPBELLTON, N.B., Nov. 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—In regard to your Shingle Saws, you can say that I have been using Shingle Saws of your make (Simonds) for the past four years, and they have given good satisfaction. I am running nine machines and use a good many saws, but have never had a saw yet that did not work satisfactorily. Before using your saws I used saws of American make, which worked well, but after giving your saw a trial have continued to use yours, as they are cheaper, and in regard to working qualities are all that is needed.

Yours truly, KILGOUR SHIVES.

CLAVERING, ONT., May 3rd, 1897.

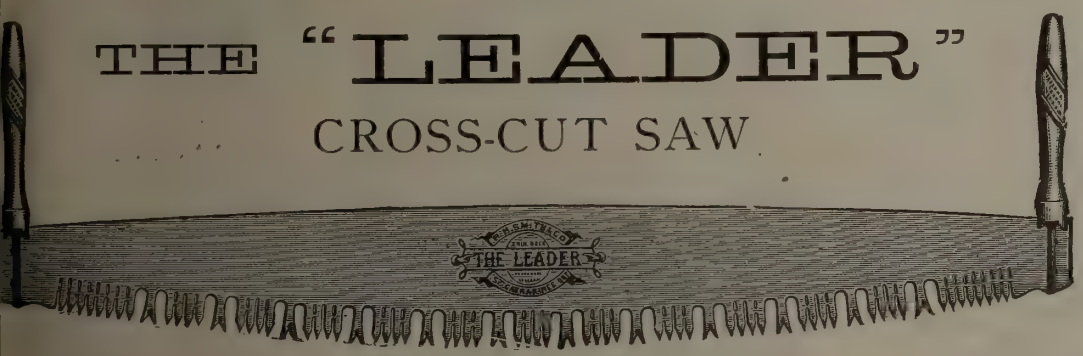
R. H. SMITH CO., LTD., St. Catharines, Ont.

GENTS,—In reply to your letter asking me how I liked the 62" SIMONDS Saw, I must say in all my experience I never had a saw stand up to its work like the one purchased from you last month. Having used saws for the last 22 years, and tried different makes, I can fully say it is the best saw I have ever had in my mill, and would recommend the SIMONDS' Process Saws to all mill men in need of circular saws.

Yours truly, W. G. SIMMIE.

P.S.—I am sending you my old saw to be repaired; please hammer to same speed as new one. W.G.S.

THE "LEADER" CROSS-CUT SAW



These Saws are made from the best DOUBLE REFINED SILVER STEEL, warranted four gauges thinner on back than front, and the only Saws on the market that are a perfect taper from the points of the teeth to the back, and require less Set than any other Cross-Cut Saw.

They are tempered by the Simonds' Patent Process, insuring a perfectly uniform temper throughout the plate, and stand without a rival as the BEST, FASTEST, AND EASIEST-CUTTING SAW KNOWN. A gauge to regulate the clearing teeth is furnished with each saw.

Directions for Setting and Filing are plainly Etched on every Saw. None genuine without our Registered Trade Mark as shown in cut.

THE "LEADER" SAW SWAGE

Made in 3 Sizes—$2.00, $2.50, $3.00 Net.

OUR PRICES ARE RIGHT. KINDLY ALLOW US TO QUOTE YOU BEFORE PURCHASING.

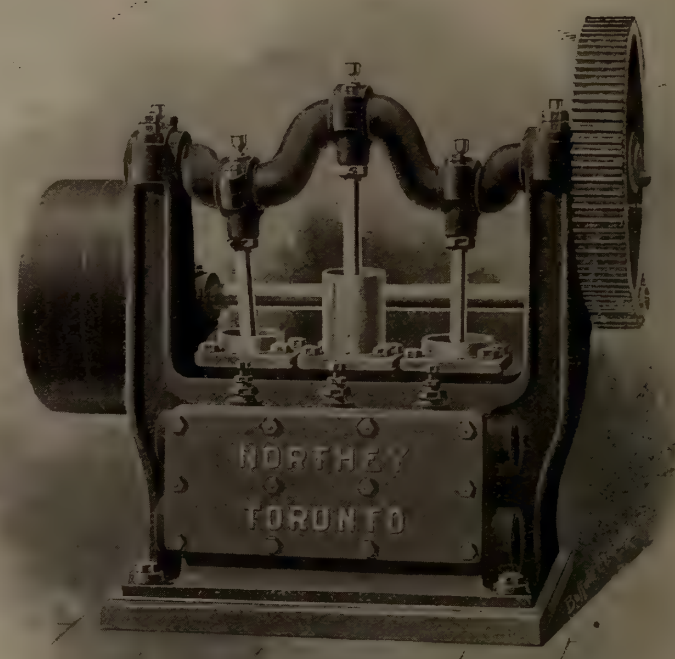
R. H. SMITH CO., Limited, St. Catharines, Ont.

Northey Triplex Power Pump

FOR BOILER FEEDING AND GENERAL PRESSURE PURPOSES

In the Northey Triplex Power Pump we offer a machine put together with the skill brought by years of experience in pump building, and with full provision made for the varied demands likely to be made upon a pump of this character. A feature of value is that the three cranks are placed 120 degrees apart, thus giving a practically constant flow of water—minimizing strain on pump and economizing power. The pump can be readily repacked and taken up, and all details are carefully worked out. It can be conveniently operated by electricity, by water power, or by belt from engine. Different styles and sizes made to suit all duties.

WE ARE MANUFACTURERS OF OVER FIVE HUNDRED DIFFERENT STYLES AND VARIETIES OF STEAM AND POWER PUMPS FOR STATIONARY AND MARINE PURPOSES. WE INVITE ENQUIRIES FROM ENGINEERS, MINE SUPERINTENDENTS AND OTHERS FOR THEIR REQUIREMENTS IN OUR LINE. CATALOGUES AND SPECIFICATIONS FURNISHED UPON REQUEST.



We are also manufacturers of the Northey Gas and Gasoline Engine which has proved to be the handiest and most convenient power for small or intermittent power users in the market. Suitable for machine shops, pumping and electric light plants, etc. Write for illustrated descriptive booklet.

THE CANADA LUMBERMAN

VOLUME XXI. NUMBER 3. | TORONTO, CANADA, MARCH, 1901 | TERMS, $1.00 PER YEAR Single Copies, 10 Cents

MR. JOHN ARBUTHNOT.

THE present chief municipal officer of the city of Winnipeg is an esteemed representative of the lumber trade, in the person of Mr. John Arbuthnot, whose features are portrayed on this page. Mr. Arbuthnot was born at St. Catharines, Ont., and was educated at the public school there. Leaving St. Catharines in 1882 he engaged with the late John Ross, contractor, with whom he worked on C.P.R. construction on the north shore of Lake Superior. In 1885 he carried out a contract on the Northern Pacific Junction Railway in Muskoka, and in 1887 another on the Milwaukee Northern Railway in Wisconsin.

In the year 1889 Mr. Arbuthnot started in the lumber business in connection with the Western Lumber Company at Rat Portage, Ont., and in the spring of 1892 established a wholesale and retail lumber business in the city of Winnipeg, which he still conducts.

Mr. Arbuthnot served as Alderman for Ward 5 in 1897 and 1898, and in the latter year was chairman of the Board of Works. He was elected as Mayor of the city at the last municipal elections.

CONSUMPTION OF RAILWAY TIES.

How many railroad ties are used annually in the United States is a question which is often propounded, but on which there are no exact statistics. There are about 205,000 miles of main line track in the United States at the present time. It is estimated by railroad men that about 400 ties to the mile are each year required for replacements; the average number of ties to the mile is 2,800, and the average life of a tie is seven years. There is therefore required on the present railroad mileage of the country about 82,000,000 ties annually for replacements, with another 14,000,000 needed for new track, assuming that the construction is about 5,000 miles annually. There is thus a total use in sight of about 96,000,000 ties a year. Something over a year ago it was estimated that of the 80,000,000 ties then said to be used for renewals each year, 45,000,000 were of oak, 12,500,000 of pine, 3,500,000 of chestnut, 5,000,000 of cedar, 2,500,000 of hemlock and tamarac, 2,500,000 of redwood, and 1,500,000 of cypress.

Ross & Taylor, of Exeter, Ont., intend building a new planing mill in the spring.

A suit involving about $400,000 was recently heard in the Superior Court at Hull, this sum being the amount claimed to be due Mrs. F. Dezouche, of Bryson, by Alex. Fraser, of Ottawa, for the alleged improper sale of a timber limit. Mr. Fraser maintains that the limit was legally and advantageously sold.

REQUISITION FOR IMPORT DUTY.

FOLLOWING is a copy of the memorial presented to the Dominion Government by the British Columbia Lumber & Shingle Manufacturers' Association asking for a duty on lumber imported from the United States:

Right Hon. Sir Wilfrid Laurier, G.C.M.G., P.C.
Premier, and Members of the Dominion Government:

Sirs,—On three former occasions in 1898, 1899 and 1900, we, the Lumber and Shingle Manufacturers of British Columbia, have addressed you on the subject of the anomalous and unfair conditions under which we have to carry on our trade, in the hope that some alleviation of these conditions would be effected by legislation in the direction of the imposition of customs duties on lumber and shingles imported into Canada from the United States.

MR. JOHN ARBUTHNOT, WINNIPEG.

We have to regret that so far nothing has been done with reference to this matter, which is of so much vital importance to us that we are forced again to bring the subject to your notice, in the hope that conditions may now permit of a favourable consideration of our desires.

The chief burden of our complaint is that our trade is unfairly discriminated against under the present tariff, being, we believe, the only manufacturing industry in Canada which is left totally without protection in our own home markets, whilst contributing largely to the more prosperous conditions of other manufacturers and producers whose manufactures we use, and for which we pay enhanced prices consequent on the protection which they enjoy under the present existing tariff from the competition and cheaper price of like manufactures and productions in the United States.

Our industry contributes largely to the revenues of both Dominion and Provincial Governments in timber dues and by customs duties on all machinery and supplies used in the production of our commodities, or, as we have already pointed out, we contribute to the prosperity of manufacturers of machinery and saw mill supplies of all kinds, and to that of millers and farmers by paying to them higher prices as before refrered to, and to that of railways by the carriage of these supplies and of our own productions. On the other hand, when a contractor requires timber for some important Government work such as a canal or bridge, a railway for bridge or trestle work, a manufacturer for a new factory or mill, or a farmer for a new barn or dwelling, and we ask for our production a mere living price, we are met with the reply that pitch pine from the United States can be obtained at cheaper prices, or pine from Minnesota can be got at less cost, and that even our own description of lumber can be bought cheaper on Puget Sound, which may be possible, as they can produce cheaper, because all their supplies cost less.

The above is not a distorted representation, but the true state of our trade, and we trust that it may clearly show the injustice of the conditions under which our business lies.

We have had to base the prices of our productions on those of producers who have advantages towards cheap manufacture which we do not possess. The imposition of a duty on lumber and shingles is not sought for as a means of increasing prices, and competition between the many Canadian producers would prevent this if attempted, but the United States manufacturers having a protected home market of their own in which they make every effort to maintain prices, regularly disturb our conditions and prices by using our Canadian markets as a dumping ground in which to unload their surplus stock at prices below what they will accept in their own markets, or at which we can, under present conditions, manufacture, and it is from this unfair competition we ask protection.

The unfairness and anomaly existing in the before described condition is still further intensified by the position that not only is our Canadian home market open and free to the manufacturers of the United States, from whom neither Dominion or Provincial Governments derive any financial support, nor do they aid in the development of our country ; but our products are shut out of their country by the duties imposed on them of $2 per 1000 feet of lumber, and 30 cents per M. on shingles.

It is a recognized fact that the extension of this market and consequent increase of the volume of business done, assists the manufacturer in reducing the cost of production, and it is to this that we look for an improvement in our condition if our own markets are protected from invasion, but it can never be attained under present existing circumstances.

While we have to compete with our neighbors to the south in the markets of the world common to us both, a considerable portion of our product not suited to foreign trade must be disposed of at home, and this our mills cannot do, so that in foreign trade also we are handicapped, as the lumber produced for that branch of the business has to bear to some extent the loss on the other, and producers find themselves loaded with an ever increasing surplus for which it is impossible to find a sale.

On the other hand, the manufacturer in the United States has the markets of the world at large and of Canada open to him on the same terms as ourselves, and in addition has his large home market from which we are practically debarred.

We are not afraid of competing with the United States manufacturer on even terms, that is to say, on the terms of free lumber between both countries, but we must denounce in the strongest terms the unfairness of the one sided relations which now exist.

Instead of the manufacture increasing in our own country, the tendency is towards establishing new plants in adjoining United States territory, and this has already been done, the raw material being derived from British Columbia, manufactured in the United States, and thus has the advantage of both United States and Canadian markets. The inducement towards such a course must be so evident that we trust your Government will see the advisability of taking measures to obviate Canadians being driven to such an alternative.

We would respectfully again urge the propriety and necessity of imposing a duty on lumber and shingles entering Canada from the United States equal to that levied by the United States on the same products when entering the United States from Canada, which at present is $2 per 1000 feet on lumber, and 30 cents per M. on shingles ; to be lessened or abolished when it is made to appear to the Governor General in Council that such course has been taken by the Government of the United States.

We feel that the imposition of an import duty on such terms should be due to our own dignity as a country, would be of general benefit not only to the trade, but to the people and country at large, without inflicting a hardship on any.

We again beg to urge on the Government through you that the unanimous wishes of our industry throughout the Dominion receive your practical consideration during the coming session of Parliament.

We have the honor to be, Sirs,

Your obedient servants,

(Signed) JOHN HENDRY, President,
HILTON KEITH, Act. Sec'y,
B. C. Lumber & Shingle Manufacturers' Association.

VANCOUVER, B. C., January 16th, 1901.

INCREASED COST OF PRODUCING LUMBER.

The increase in the wages paid in the lumbering industry in the past three or four years has been very marked, as is shown by the statistics published by the Labour Gazette, which we give below. The standard of living has also been raised, and the cost of producing lumber seems to be increasing each year.

The following summary of the wages list of a leading firm on the Georgian Bay shows an increase of nearly 60 per cent. in the wages of woodsmen between 1896 and 1900, as follows :—

IN THE WOODS.

1894-5-6	wages about	$16 to $18	with board	per month.
1897-8	"	18 to 20	"	"
1898-9	"	26 to 28	"	"
1900-1	"	26 to 30	"	"

IN THE WOODS— Average wages per month with board.

River drivers...	28 to 32	..	..	..	35 to 40	35 to 40

PREVAILING RATES OF WAGES.

The wages of workmen in the several departments of the lumbering business and in different parts of Canada are set forth in the following tables. In each of the three groups of men there are a number specially skilled who command high wages. Thus in the mills there are the men in charge of the saws, the men who keep the saws in repairs, and the men who have to use considerable judgment in the matter of selecting lumber of different grades. So also in the woods and on the drives skilled men command relatively high wages. Besides the saw mills there are large numbers of small mills engaged in sawing up hard wood and other logs generally obtained locally and in working up special products. In such cases a somewhat different division of labour is observed requiring separate treatment. A large number of mills, especially in central and western Ontario, from which returns have been received, are of this class.

MONTHLY WAGES (WITH BOARD) OF MEN EMPLOYED IN THE WOODS AND ON THE DRIVES.

DISTRICT.	IN THE WOODS.					ON THE DRIVES.	
	Foremen.	Log-cutters.	Teamsters	Road-masters and Shanty hands.	Cooks.	Tug hands.	River Drivers.
	$	$	$	$	$	$	$

Manitoba	80 to 100	26 to 32	26 to 32	25	40	1.50 to 1.75 (per day).	1.75 to 2.00 (per day)
British Columbia	.....	.....	.....	.....	.....	.....	.....

In the case of river drivers, the increase has been nearly 50 per cent. in the past two years. Where two years ago they were paid from $28 to $30 per month with board, they were paid last year $40 per month with board.

In the mills the increase in the case of the employees of this firm appears from the following summary :—

	1897-8.	1898-9.
Foreman.....	$ 2.50 per day	$ 3 per day
Sawyer.....	2.50 to $3 per day	3 to $4 per day
Filer.....	2.50 to 3 "	3 to 4 "
Setter.....	30 to $35 per month	35 t $40 per month
Edger.....	30 to 35 "	35 to 40 "
Trimmer.....	32 to 35 "	35 to 45 "
Pilers.....	30 to 35 "	35 to 40 "
General labourer.....	26 per month	1.25 to $1.50 per day
Firemen.....	1,50 to $1.75 per day	1.50 to $1.75 per day

The following statement of the wages bill on the Parry Sound district, supplied to the Department by a lumberman of experience, shows that in that region the sharp advance has taken place within the past year :—

IN THE MILL—Average wages per month without board.

	1895.	1896.	1897.	1898.	1899.	1900.
	$	$	$	$	$	$

Inspectors	50	50	50	50	55	55
Engineers.....	45	45	45	45	50	50

In above table of wages in the woods and on the drives, quotations are given of the amount paid in several of the best known groups of occupations. A number of special cases exist, as for example in the 'square' timber or 'waney' timber camps, where men with a special training in the selection and cutting of the trees required for this class of timber are paid more than ordinary woodsmen. Thus in the Ottawa Valley 'square' and 'waney' timber camps, the 'hewer' receives $60 per month and the 'liner' $40. In addition to the groups of woodsmen above given, there are the 'loaders' who receive $24 per month. The camp blacksmith usually received about $35 per month, and the 'handy man' (carpenter, &c.), from $28 to $30.

In British Columbia the divisions of woodmen are different. The following statement shows the wages paid per hour to the several classes of men employed in the woods by a company operating in Vancouver :—

Head skidder, 30 cents per hour ; hock tender, 35 cents ; undercutter, 30 cents ; head faller, 35 cents and 30 cents ; second faller, 27½ cents ; head loader, 27½ cents ; donkey engineer, 27½ cents ; bucker, 27½ cents ; second loader, 25½

cents; sniper, 27½ cents; second hock tender, 27½ cents; head barker, 22½ cents; head swamper, 30 cents; skid road man, 22½ cents; labourer, 20 cents.

STANDARD OF LIVING.

One of the marked changes in the lumbering industry in recent years has been the improvement in the standard of living provided for the men in the camps. The reports received from the employers in this regard appear to be borne out fully by the men themselves. A wholesome diet and plenty of it, is the general verdict. The following summary of the bill of fare in the several districts has been supplied by the companies themselves :—

Nova Scotia.—Beef, pork and beans, molasses, codfish, tea, coffee, sugar, &c. Living expenses of mill hands who support themselves cost about $2.50 per week.

New Brunswick.—Pork and beans, fresh beef, codfish, potatoes, bread, ginger bread, butter, granulated sugar, molasses, tea.

Quebec.—Beef, pork, beans, peas, bread, cakes, canned goods, molasses, tea.

Ontario.—Bacon, fresh beef, fresh pork, pastry, bread, butter, pudding, syrup, tea, sugar, beans, rice, currants, raisins, figs, prunes, dried apples, potatoes, cabbage, carrots, onions, turnips, &c. (Some of the firms give a greater variety than others, but few complaints come from the employees of any.)

Manitoba.—Beef, pork, beans, potatoes, carrots, turnips, soups, bread, cakes, dried apples, apricots and occasionally pies.

British Columbia.—Food supply reported as good as average hotel in district; fresh meat, fish, vegetables, canned and dried fruits, &c.

Generally, excepting for clothing, tobacco and incidentals, the men have everything found for them and there is a good prospect of saving. In many cases, however, the men tend to be extravagant upon coming out from the camps and spend much of their savings before securing further employment. Others manage to save from $40 to $80 and sometimes more as the result of the season in camp.

There is no general rule regarding hours of labour, the duration of daylight being the chief determining factor regulating the working day. In the mills, the usual day's work covers from 10 to 11 hours. In the woods and on the drives the working day lasts from daylight until dark. In some cases where the field of operation is some distance from the camps, the men start from the shanty before daybreak and return after nightfall.

THE NATIONAL HARDWOOD LUMBER ASSOCIATION.

The Inspection Bureau Committee of the National Hardwood Lumber Association held a meeting in Cincinnati, Ohio, on January 24th, at which an interesting report was submitted by Mr. M. M. Wall, of Buffalo, the surveyor-general of the association. This report in part is given below :

Four million six hundred and seventy-five thousand feet of lumber has been inspected to date by Association inspectors, mostly in small shipments, and for our members who have had a few cars done at a time, mostly in the way of experiment, but the amount of work for the inspector is increasing daily, as our members who have used the Association inspectors express themselves as highly pleased.

In pushing this work, I find all classes of lumber men appreciate the value of the Inspection Bureau. We are filling a long-felt want in the trade, but I wish to impress upon the honorable chairman and members of this committe and of the hardwood lumber trade at large, that they owe it to themselves and to me to support this movement by giving us every bit of work possible. The Inspection Bureau is doing a great work for the hardwood trade, a work that is of benefit to every legitimate trade interest, and all that is required to make a success of our undertaking is that the members of the lumber trade, manufacturers, dealers and consumers, shall lend this bureau their support.

It has been difficult to secure the services of men of the standing and ability which the bureau requires, to act as inspectors, and it is absolutely necessary that the members of this association shall give them every bit of work possible, as there are no salaries attached to any of these positions; and as the inspectors are paid entirely by the fees, it remains with the members to make their positions remunerative, and if they are not made remunerative, the services of the best men cannot be had. I cannot too strongly impress this matter upon the attention of our members. If the inspection bureau, with all of its great possibilities for good, is to become a permanency, the members of the National Hardwood Lumber Association must assist the inspection bureau and myself, by lending us the strongest support possible.

Our inspection bureau has been indorsed by every lumber market in the United States with the exception of New York and Boston. In these two markets I have spent a great deal of time and effort, without having as yet produced any tangible results. I earnestly recommend this committee to take some action at this meeting which it believes will have the effect of bringing these great markets into line with our movement.

If we cannot secure the co-operation of the lumber trade associations of these markets, I believe it would be advisable to establish national inspectors, duly licensed and bonded in these markets, who shall have the unqualified support and backing of our Association.

In working out the details of organization, I have found it necessary to make certain changes in our plans outlined by this committee for the government of the bureau. Different conditions exist in different localities, and I have taken the liberty to make such changes as I have considered advisable, and I trust that my action in these matters will meet with the approval of your honorable committee. In pushing this work I have received the hearty support and co-operation of the trade press, which has rendered me every assistance possible, and which has shown itself fully alive to the great importance of the work which we are doing. For this assistance I wish, on behalf of the association, to extend thanks. The members of the lumber trade in all markets also have shown me every courtesy possible, and I feel very much encouraged that the task of establishing a national, uniform and guaranteed inspection of lumber, is almost an accomplished fact. There is one criticism that I have to offer, however, and that is regarding the tendency of some members to use our inspectors and this bureau only when they are in trouble. This places on the inspection bureau the responsibility of settling the difficult matters, to which we do not object, as we are here to help our members when in trouble; but if our members would use the national inspectors when making their sales and shipments of lumber and for the general run of their business, it would materially assist the work in which we are all so much interested, and at the same time save themselves any possibility of misunderstandings, loss and litigation.

In conluding my report, I wish to state that the work of establishing an inspection of lumber which shall be on a par with the inspection of other commodities; which shall do justice to the buyer and seller; which shall guarantee that the goods sold shall be delivered as sold; which shall make a lumber contract mean what it says, is progressing satisfactorily. It is a great work and may not be done in a day or a year. Our members must remember that the inspection bureau was evolved from nothing, and they must bear with our mistakes and shortcomings patiently. We are doing the best we can. When our members make their contracts, let them be based on national inspection and the work be done, when possible, by a bonded national inspector.

I am convinced that our work can be made a success. Our plan is right, and all we need is the undivided support of the good people in the lumber trade.

TRAVELLING LIBRARIES.

A little booklet has been issued entitled "Library Extension in Ontario," giving a brief history of the movement to establish travelling branch libraries in lumbering and mining camps, a statement of the work so far undertaken, and expressions of opinions from the Minister of Education, the leading lumbermen and others as to the advantages to be derived from such libraries. Objections were raised by a few that many of the men engaged in these industries could not read intelligently, and that the hours of labor were necessarily too long to admit of reading or study. To give the experiment of good literature in the camps a fair trial an extra building has been put up at two camps, five and twelve miles respectively from Nairn Centre, and a third twenty-one miles south of White Fish station. The first mentioned is at a camp operated by the Victoria Harbor Lumber Company, the second at one of Edmund Hall's camps, and the last at J. J. McFadden's camp. Branch libraries in French and English from the Nairn Centre public library have been placed in these reading camps, and one of the McGill University travelling libraries will be circulated in the Victoria Harbor camp No. 2. Weekly and daily newspapers, illustrated magazines, and other suitable literature have been placed at the disposal of the men, who are being urged to improve their spare moments and to ask help from the nearest neighbor.

The shanties in question are built of different sizes and designs so as to ascertain the most suitable building for the purpose. The movement, in which Mr. Alfred Fitzpatrick, of Nairn Centre, is largely interested, is meeting with success from all directions, and promises to be of great benefit to employees in lumber and mining camps.

The public is given an opportunity of co-operating in the movement by sending contributions of money or literature to Mr. W. J. Bell, lumberman, Nairn Centre, who is acting as treasurer pro tem.

—The lumber surveyors of St. John, N.B., have formed themselves into an association. F. E. Hill is president, F. Langan vice-president, Herbert McAloon secretary, and C. Robinson treasurer.

Canada Lumberman

MONTHLY AND WEEKLY EDITIONS

PUBLISHED BY

The C. H. Mortimer Publishing Company of Toronto, Limited

CONFEDERATION LIFE BUILDING, TORONTO

BRANCH OFFICE:
IMPERIAL BUILDING, MONTREAL

The LUMBERMAN Weekly Edition is published every Wednesday, and the Monthly Edition on the 1st day of every month.

TERMS OF SUBSCRIPTION:

One Copy, Weekly and Monthly, One Year, in advance..... $1.00
One Copy, Weekly and Monthly, Six Months, in advance..... .50
Foreign Subscriptions, $2.00 a Year.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in anyway affecting it. Even when we may not be able to agree with the writers, we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

IN COMMON WITH LOYAL SUBJECTS OF THE EMPIRE THROUGHOUT THE WORLD, WE DEEPLY DEPLORE THE LOSS OF THE GRACIOUS SOVEREIGN WHOSE LONG AND GLORIOUS REIGN CAME TO A CLOSE AT OSBORNE PALACE ON JANUARY 22ND, 1901. "SHE WROUGHT HER PEOPLE LASTING GOOD."

JUSTICE FOR CANADIAN LUMBERMEN.

MR. W. H. Bennett, M. P., has given notice in the Dominion Parliament that he will introduce the following resolution: "That in the opinion of the House a duty should be levied upon lumber imported into Canada corresponding with the existing United States duties." How this resolution will be received by the legislators cannot even be surmised. The fact that the Government has turned almost a deaf ear to the representations of the lumbermen in this direction in the past is not a hopeful indication; but the sentiment in favor of an import duty is gradually growing stronger, and the lumbermen are daily making new converts from among the thinking public. As in the case of recent legislation by the Ontario Government affecting lumbering, it may prove that the Dominion authorities will conclude that the time has now arrived when the legislation asked for should be granted.

It is almost unnecessary to again review the situation and point out the unfair conditions resulting from the free importation of United States lumber. These conditions must already be known to our legislators. The situation was clearly set forth in the address of Mr. John Waldie before the Ontario Lumbermen's Association. In this country the cost of labor and mill supplies is greater than in the United States, while that country enjoys the advantages of cheap transportation by railways, which is something unknown in Canada.

A memorial printed in another column gives the views of the lumber and shingle manufacturers of British Coulumbia, and in our opinion makes out such a strong case in favor of an import duty that it will be difficult for the Government to conscientiously ignore the request. The statements contained in this memorial are a fair representation of the situation, and are actually bonre out by facts. The manufacture of lumber in British Columbia is so handicapped by the free import of the United States product (while the Canadian product is shut out of the United States by an import duty), that some manufacturers have already removed their mills to the United States, where they may enjoy the advantages of both markets. Proof of this is to be found in the following letter, unsolicited so far as it relates to the question of an import duty:

VANCOUVER, B. C., January 31, 1901.

CANADA LUMBERMAN, Toronto:

GENTLEMEN,—Replying to yours of the 13th inst., would say that at the present time we do not care to put an advertisement in your paper, for the reason that our territory called Canada is well covered at present with men, and on the other hand, there being no import duty on shingles from the United States, it leaves us so that we are not pushing very particularly for business in Canada. It seems that on account of this duty and the importation of wooden goods from the United States to Canada, we are compelled to go to Washington, as you will see by our advertisements in those papers.

We are building another mill at Sumas, in Washington, and anticipate building still another in the course of two months. We do not understand the unfair treatment to the lumber industry in Canada, and we have got tired trying to remedy matters in that way, and are simply going where we can do business and where the lumber industries are protected as well as others. We are neither strong Conservatives nor Liberals, but we look at the unfairness of the matter.

At the present time the capacity of the Canadian mills, according to the Canadian trade that is left us, exceeds the demand about three times if all mills run full time.

We are sorry to have to write in this way to practically the only lumber paper in Canada, but we are compelled to.

Yours very truly,
HASTINGS SHINGLE MFG. CO.

The injury wrought tothe lumber manufacturing industry of British Columbia is apparent and Canadian workmen are thus deprived of the employment which it should be the duty of the national government as far as is expedient to provide for them.

The suggestion which has been made in the Dominion House to nationalize the railways of the Dominion is one bearing an important relation to the proposed import duty on lumber, inasmuch as the inability to obtain reasonable freight rates has been one of the great drawbacks to Canadian lumbermen. The opposition to an import duty on lumber will come from the inhabitants of Manitoba and the North-West Territories, who may fear that they would be called upon to pay exorbitant prices for the necessary lumber for building and other purposes. At the present time a large quantity of lumber is imported into these provinces annually from the United States, the railways of that country fixing the freight rate at such a figure as will permit the manufacturers in northern Minnesota to supply certain sections of Manitoba and the Territories, to the exclusion of the Canadian product. There is no reason, however, why the consumers of lumber in these provinces should be called upon to pay excessive prices for building material unless it be the arbitrary position now taken by the Canadian Pacific Railway. There is an abundant supply of timber in the Lake of the Woods district, and with the United States product excluded from the Canadian market, the facilities for producing lumber in this district would be increased so as to furnish an ample supply for the western markets. If more equitable freight rates were obtainable, the manufacturers of the north shore of the Georgian Bay would also make a bid for the trade of the prairie province, so that there seems no reason to doubt that competition would prevent the consumer from being called upon to pay more than a reasonable price for his lumber. Some of the mills of the north shore of the Georgian Bay have, we understand, already made shipments of lumber to the city of Winnipeg.

Reasonable freight rates, however, are necessary, and whether these are secured by the nationalization of the railroads or by the appointment of a commission to regulate freight rates and like matters, they would prove a great benefit to the lumber trade, and would solve the problem of a lumber supply for the prairie provinces from the Canadian forests.

THE ASSESSMENT OF LUMBER.

THE latest design to burden the lumber industry of the country is a proposition to assess all lumber piled within corporation limits. The city council of Ottawa is responsible for having originated this movement. A motion was recently introduced in the council of that city "to petition the Ontario Legislature to make such provision in the Assessment Act as will ensure the taxation of lumber piled within the city limits; and also that all lumber piled or stored on any land within the city limits be assessed to its full value against the person assessed for such land, without regard for the ownership of such lumber or any indebtedness against the same, in order that such lumber and land may be placed upon the same basis with regard to taxation as other property and made to bear its fair proportion of taxation."

It is difficult to understand why, in the eyes of these municipal authorities, lumber should be singled out to be dealt with in a manner different from other lines of manufactured goods. Is not the product of the farm, the mine, and the fisheries equally liable in the matter of taxation with that of the forest?

No business or industry is more helpful to the farmers of Canada than the lumber trade, nor is there an industry which has done more to build up the villages, towns and cities of the Dominion. Such a proposition as has been made comes with bad grace from the city of Ottawa, which owes much of its commercial importance to-day to the lumber industry and to lumbermen who have invested their money in establishing saw mills and other enterprises.

For some reason there seems to be an eternal enmity towards the lumberman. He is already taxed to the utmost, while he is not afforded a corresponding measure of protection. Every article used in his business that it is necessary to import is subject to a duty imposed by the

ominion Government. He is charged a Crown nt and Crown dues to the full extent that the usiness can pay and permit of its continuance. is plant is assessed by the municipalities, which, nally, now propose to tax the output of this ant.

Perhaps one reason why the business of lumber- en is unduly burdened is that their operations e necessarily large and represent a large mone- ry investment. Yet is there another class of anufacturers whose operations involve greater sk?

There seems to be an impression by the public hat lumbermen are accumnlating vast wealth, t it is a fact that there have been only two ears in the past ten in which the business has een found profitable.

We do not apprehend that the Ontario Govern- ent will sanction the proposition to place a x on lumber and thus cripple an industry which lready bears more than its fair share of taxation.

EDITORIAL NOTES.

A CONVINCING proof that the people of the nited States believe that Canada, in her vast mber resources and water powers, holds the ey to the pulp and paper trade, is found in the rge amount of space given to Canadian matters y the American publications. Column after olumn in each issue of the leading pulp and aper trade journals are devoted to chronicling the ovements for the development of the pulp and aper industry in Canada, and frequently far- tched arguments are advanced in the endeavor o show that the United States will continue to ontrol the situation for many years to come. et between the lines one can easily discern that he statements are inspired more by a feeling of ealousy than by faith in the future supremacy of he United States.

THE CANADA LUMBERMAN has been asked to xplain what steps should be taken by Canadian anufacturers wishing to make an exhibit of ood products at the Glasgow exhibition. Mr. J.M. Macoun, who had charge of the Cana- ian forestry exhibit at Paris, is looking after he collection of the articles for the Glasgow xhibition, which will include all kinds of anufactured articles made from wood alone. here is ample space for such exhibits of what- ver kind. The Dominion Government pays all osts of transportation, installation, etc. All hat is necessary for exhibitors to do is to write o the Minister of Agriculture asking for shipping abels and directions for shipment. The Glas- ow exhibition following so closely after the one t Paris, should serve to clinch many profitable ranches of trade that were suggested by the aris exhibit. Mr. Macoun states that if Cana- ian producers could only realize the extent of he business to be done in Europe, they would ot be content with the United States market.

THE Inspection Bureau of the National Hard- ood Lumber Association of the United States s apparently meeting with considerable success n its work, as will be seen by reference to the eport of the Surveyor-General, Mr. M. M. Wall, o be found elsewhere in this issue. Every lum- er market in the United States, with the excep- io of Boston and New York, have indorsed the nspection Bureau. Mr. Wall is of the opinion that it would be a great advantage to our hard- wood manufacturers if an arrangement could be made to have national inspectors stationed at the central manufacturing points in Canada, and that sales of lumber could be made where the orders are now lost to our manufacturers. He points out that there are times when all the hardwood people in the east could use a few cars of Cana- dian stock, but our manufacturers usually desire that the question of inspection shall be settled at point of shipment, and it would be entirely too expensive to send an inspector to inspect a few carloads, with the chance of a disagreement between the inspectors when they got on the pile to ship. Under the system of the National Association an inspection made by one of its in- spectors would be final between buyer and seller. Mr. Wall is a strong advocate of the benefits to be derived from this Inspection Bureau, and believes that in a short time such progress will have been made as to make it of great benefit to the hardwood manufacturers of both Canada and the United States.

THE extent of the trade in hardwood lumber with Europe is limited only by the ability of our manufacturers to supply the stock required at satisfactory prices. That dealers in Great Britain, Germany, and other countries are not only willing but anxious to obtain supplies from Canada is proven by the frequent receipt, by the publishers of this journal, of letters enquiring for certain specified stock. The latest is from a reliable London firm who are desirous of arranging for a regular supply of hardwoods, chiefly basswood, soft elm, and maple. Some of our manufacturers seem averse to taking hold of the British trade, but it is possible that they might find it more profitable than they anticipate. It would be well for each manufacturer to accept at least a trial order. When trade with the United States be- comes a little quiet, a British connection might be found very acceptable. Certainly during the past year some of our hardwood manufacturers could have made a few shipments across the water without losing any of their local or United States business.

BAND VERSUS CIRCULAR.

A United States saw mill owner gives to the American Lumberman his experience regarding the merits of band and circular saws. He says: "We built a circular saw mill about twelve years ago, costing with dry kilns and necessary build- ings $7,000. We operated it nearly five years, when it was burned down. Its capacity was 25,- 000 feet of scaled logs, Doyle rule, a day. It was rebuilt carefully as a band mill, with about the same capacity, and has been running steadily ever since. As a circular there was no overrun; as a band the overrun of sawed lumber shipped has averaged 30 per cent. From March last till Christmas the overrun was 32 per cent., and there were not 5,000 miscuts during that time. I should say, however, that in building the band mill extra pains were taken to have good founda- tions and a very solid, heavy frame. In conse- quence the work done by the mill has been ex- cellent and scarcely any alterations or repairs have been necessary, except on account of wear. This mill cost $25,000 with sheds and outbuild- ings. This year we have added a band resaw, which has increased our capacity one-third, and our overrun much more. The cost of this im- provement, entire, was $2,550. Included in the overrun were about 7 per cent. of common bark strips which net about $3. Our inspection shows 24 per cent. No. 1 and No. 2 with all counted that is shipped. The logging outfit and expense is extra. My opinion is that whiskey is largely to blame for losses in the small circular saw mills. Lumber is badly manufactured, thick and thin, no dry kilns and therefore stained. Bad manufacture almost always results from bad foundations; unless they are perfectly solid good lumber cannot be made. Usually a basin where wells can be sunk is selected, heavy rains come and water remains about the mill; there are no drains, the roof leaks and does damage; they cannot afford to stop and make needed repairs, so patch up and go on sawing poor lumber, which drags all the markets down. The foregoing is my opinion. Of course the amount of timber to be cut has much to do with it—not less than 25,- 000,000 would justify the building of a band. The writer has had fifty years' experience in manufacturing and dealing in lumber in various sections and has been successful in a fair way."

Concerning the subject the editor of the Ameri- can Lumberman makes the following remarks: "The matter of overrun by use of the band is an extremely important one. If the object be to produce 25,000 feet of lumber per day, and there is an overrun of 30 per cent. from log scale by use of the band as compared with no overrun by use of the circular, the band will produce the 25,000 feet from a little over 19,000 feet of logs. If logs are worth $5 a thousand there is there- fore a saving of $30 a day from that one factor. On the other hand, there should be some over- run with a well managed circular, which nowa- days can be run successfully on an 8-gage kerf. There is lacking in the above any statement as to the comparative cost of operation. The origin- al cost of the band mill was $18,000 greater than that of the circular, interest on which at 6 per cent. will be $1,080 a year; whereas the saving by overrun during 200 days' operation will be $6,000. This whole problem is one which must be figured out in every case according to the character of the timber, the class of work to be done, the amount of work required, taking into account the difference in the cost of the two characters of mills, both originally and in opera- tion."

PROPOSED SCHOOL OF FORESTRY.

Prof. B. E. Fernow, director of the New York State College of Forestry, on January 21st last gave a lecture at Queen's University, Kingston, Ont., on "Forestry." The lecture was mainly of a botanical character. The following day a conference was held with the authorities of the university and representatlves of the govern- ments, at which the establishment of a forestry department in connection with Queen's Univer- sity was considered. Hon. Mr. Harcourt, Ontario Minister of Edncation, strongly favored the inauguration of such a school, and it is prob- able that some action in this direction will be taken in the near future.

The Harbor Commissioners of Toronto have made a reduction in harbor dues equal to about four cents per thousand feet, board measure, on lumber.

WESTERN RETAIL LUMBERMEN'S ASSOCIATION.

The tenth annual meeting of the above association was held in the city of Winnipeg on February 19th. There was a large attendance of members and visitors. Mr. Henry Byrnes, of Winnipeg, president of the Association, occupied the chair, and after opening the meeting called upon the secretary, Mr. Isaac Cockburn, to read the minutes of the previous meeting, which were confirmed.

The annual address of the president was then presented as follows :

[Gentlemen and Fellow Members of the Western Retail Lumbermen's Association :]

I deem it an honor to be privileged, as your president for the second time, to welcome you here in attendance at this annual meeting. I regret that it is not my good fortune, owing to the effect of a disappointing harvest, to be able to offer you congratulations of prosperity in the lumber trade. I, however, can compliment you upon the wisdom exercised in your business under the existing circumstances, in anticipating so closely the effect of a short crop, by retricting your business in purchasing with caution commensurate with the absolute necessity and requirement. The farmers also have evinced a worthy caution in delaying expenditure in building and improving as much as possible, until the return of an assured good crop. Being interested in the working of the association, and wishing to acquire more personal knowledge of it, I accompanied the secretary on two trips into districts where some complaints had been formulated against some dealers for violating the price list established.

On visiting the dealers in question, we were able to harmonize the differences complained of, and start them anew to sell at the established price list, and the result was an apparent feeling to adhere to the established list. My observation has led me to believe that the association is doing much to promote a better understanding among the dealers in the conduct of business generally, and the advantage of an established price list is well borne out. Unfortunately, there has existed in the city a disruption of the price list, and lumber has been sold at no profit to the dealers, and the demoralized and slaughtering prices here have been quite injurious to members having yards in the proximity of the city, and even at considerable distances out. I may say that after an unsatisfactory experience there appears now to be a united effort on the part of the dealers of Winnipeg to make such an arrangement and agreement as will lead to reorganization and selling on an established price list in future.

You will notice that the balance on hand has increased considerably, which may be a matter for your consideration whether the annual dues may not be reduced some.

In closing, I desire to state that at the last annual meeting it was my purpose to suggest to you that it would be a fitting thing for us to join with other organizations in contributing to the patriotic fund, but this was overlooked. However, at the first meeting of the directors, the board and myself thought it proper to vote $100 to the fund then being established for the relief and benefit of such families requiring consideration and assistance on account of our gallant fellows who volunteered to take part in the South African war, on behalf of our then gracious, beloved and revered Queen, and for whose recent death we all mingle in sorrow and are touched with pride in having had so worthy, illustrious and good woman as a sovereign. We pray God to bless her noble son and successor, our soverign, King Edward VII, who has already stamped himself an able and worthy ruler, and has declared himself in giving expression of affection and reverence for his mother in language so worthy of a dutiful son to a wonderful mother, to closely follow in her footsteps in constitutional government.

Then followed the secretary-treasurer's report as given below :

Mr. President and Gentlemen,—I am pleased to be able to present to you such a favorable financial statement, showing a balance on hand to the credit of the association of $2,034,21.

There are still 34 dues unpaid, many of which will be paid, but it will be necessary to purge the membership list of some names, as it will not do to inculcate carelessness in the paying of dues. The membership stands at a gain of twenty-three over that of last year. There is a total of two hundred and four yards, and thirty-four honorary members. During the year I removed from the list seven members for directly refusing payment of their dues.

I have to report that shortly after the annual meeting I proceeded to establish price lists for the various points, and continued doing so until pretty thoroughly completed, with the exception of points west of Minnedosa, where I was advised that lists were not wanted. I did not visit the Northern Pacific points, knowing that it would be of no service, as there were non-members in competition. I have to acknowledge the active interest taken by the dealers throughout in arranging the prices, and the kind courtesy extended to me by the members, many dealers travelling considerable distances to attend meetings called for that purpose. I am glad to believe that the prices so established were generally adhered to, although there were some cases of complaint for violation of the price list, in which cases I was successful in harmonizing the difficulties which had arisen, by meeting with the dealers in question and discussing with them the grievances complained of, and securing a new start in selling on the established price list. In nearly every case a better feeling was engendered between them as a result.

At one point where I was asked to investigate a charge for selling at less than the price list, I knew the parties were not on speaking terms over some business difficulties. I first had an interview with the complainant, and told him I would bring them together, so as to sift the charge, and that he must make up his mind to discuss it with the dealer complained of, and in a friendly way. This he consented to do. I then interviewed the dealer complained of, who frankly admitted the charge, and after some discussion bearing upon the matter he gave me the strongest assurance that hereafter he would maintain the established prices. Upon calling the parties together a full discussion was had upon the charge made, and the dealer in the wrong having acknowledged the same, I then called the other dealer aside and mentioned to him that should he press the charge a penalty of $25 or over would have to be levied from his opponent, and that it would be of no direct benefit to him. To the credit of the party thus appealed to he at once replied, "I do not wish to be the cause of making my opponent pay that amount, and if he now agrees to maintain the price established, I consent not to proceed against him." I did not fail to impress this good act on the mind of the other party. This happened early in the spring, and no complaint has reached me from that point since. I merely state this case in giving my experience that this is a better mode of settling matters of complaint than referring the matter to the executive committee, when doing so can be avoided, but of course there will arise exceptional cases hichw make it imperative to do so.

The president in his address has referred to the state existing among the Winnipeg dealers, and I need not dwell upon it further than to say it affected members disastrously at points in the vicinity outlying the city. Those dealers have my warmest sympathy in the disturbance and loss of their business therefrom, and I do hope that upon the restoration of a price list for Winnipeg good business will again be brought about to the dealers referred to.

I feel called upon to make reference to a pernicious business coming under my notice which is being carried on by what is termed on the other side as poaching. I mean someone who is not a manufacturer and a non-member of the association, procures lumber from parties other than honorary members, and disposes of the lumber as best he can, and I am sorry to say that such a person has succeeded in making trouble and demoralizing prices in some instances to the serious detriment of some active members. I trust no member of the association will be found purchasing or supporting such a system as referred to, and if possible that some means may be brought to bear that will stamp it out.

This is an opportune time to discuss these phases on their merits, and I would like to impress upon the members present to do so fully and to go forth from this meeting resolved to act up to the resolution and by-laws of the association, and to be fellow workers together for mutual benefit.

The suggestions in the secretary-treasurer's report created a lively discussion in regard to the practice of cutting prices.

Several members stated that business in their particular localities had been adversely affected during the year by the action of non-members who purchased lumber in the United States and from western manufacturers who did not belong to the Association. The result of the discussion was that an understanding was arrived at that as nearly as possible hereafter the rules of the Association would be adhered to by all parties. The manufacturers and the wholesale men agreed to assist the members of the Association in this direction. The address of the president and the report of the secretary-treasurer were approved.

The election of officers resulted as follows: President, Henry Byrnes, Winnipeg ; vice-president, J. L. Campbell, Melita, Man.; directors, D. E. Sprague, Winnipeg ; T. Turnbull, Manitou, Man.; W. S. Burley, Neepawa, Man.; A. M. Stewart, Morden, Man.; J. K. Robson, Treherne, Man., and R. H. Williams, Regina, Assiniboia.

On motion of Mr. J. L. Campbell it was decided to arrange with the railway companies for an excursion to the Pacific coast during the coming summer, after which the meeting adjourned.

REDUCTION IN SHINGLE DUES.

The Dominion Government has issued the following proclamation affecting dues on shingle timber taken from Dominion lands in British Columbia :

"Whereas it is found that the rate of twenty cents per thousand chargeable on shingles under section 11 of the regulations governing the granting of yearly licenses and permits to cut timber on Dominion lands established by order-in-council of 1st July, 1898, and amending orders-in-council, is not excessive in Manitoba and the Northwest Territories, where shingles sell at from $2.50 to $3 per thousand, but in British Columbia, where they only sell for $1 per thousand, it is quite apparent that the rate is too high :

"And whereas the timber used in making shingles in British Columbia is of a class that cannot be used for the manufacture of lumber, being the hollow butts of trees cut down in logging, and therefore if not used for shingles will be burnt in the process of clearing the land; and it is thus deemed advisable to modify the said rate ;

"Therefore, His Excellency, by and with the advice of the Queen's Privy Council for Canada, is pleased to order that instead of dues being charged in the province of British Columbia at the rate of twenty cents per thousand on the manufactured shingles, the said dues shall be and the same are hereby made chargeable on the shingle bolts at the rate of fifty (50) cents per cord."

End piling under sheds is probably the best method of stacking hardwoods for seasoning. A Michigan concern has used this method several years, and finds it very satisfactory. Its sheds are 30 feet wide, 200 feet long, and high enough to take in a 16-foot board. The capacity of such a shed, the stock being end-piled, is 200,000 feet. The sheds are, of course, built especially for such work. End piling costs 15 to 25 cents per thousand feet more than cross-piling, but the results are claimed to counterbalance this.

RAILWAY CONSTRUCTION IN NEW ONTARIO.

In his financial statement made to the Ontario Legislature on the 21st of February, Hon. G. W. Ross presented in a clear and forcible manner the requirements of New Ontario in the matter of railroad construction, and threw out some important suggestions as to the methods to be pursued in supplying this need which have given rise to considerable discussion. The Premier fully realizes the necessity and the justice of so controlling the building of railway lines as to secure for the people of this province the full commercial and industrial advantage accruing from the development of the country, instead of allowing them to be diverted into other channels by means of the corporations subsidized by the people's money. The question of the powers exercised by railroad corporations and often abused to the detriment of those conferring them, is yearly becoming a more serious one. It is the uppermost issue to-day in Dominion politics, and it is well therefore that Premier Ross is showing a disposition to grapple with it in earnest with the view of avoiding those errors of judgment in dealing with railways in the past which have largely counterbalanced the great benefits of the railroad system.

The particular project considered in the Premier's speech was the proposed line running north from North Bay to open up the rich agricultural region lying north-west of Lake Temiscaming, where colonization has already been going steadily forward for some years. Eventually this line, the construction of which is now practically assured, may be pushed northward to James Bay, but its principal importance lies in the fact, developed by last year's explorations, that the clay belt of the Temiscaming region, which is considered fully equal in fertility to any farming district in the province, extends west and northward throughout the Nipissing and Algoma district, comprising a continuous tract of over 13,000,000 acres. The traffic of this extensive region to which the tide of settlement will shortly be directed, will find its natural outlet by means of the Temiscaming railway and be rendered tributary to Toronto and the other commercial centres of this province. The Premier threw out the suggestion that the House should seriously consider whether the best and most efficacious way to provide against the diversion into eastern channels of this enormous and profitable trade was not for the government to construct the line themselves, instead of bonusing a corporation to build it. He avoided committing the government to the general principle of public railroad ownership, dealing only with the special case of this purticular enterprise, and emphasizing the point that it was the gateway to this vast and productive territory, and that it was our imperative duty to guard against its being controlled by interests adverse to our commercial prosperity. The construction of the road by the government does not necessarily involve its operation by them. In fact, the Premier pointed out that after the work was completed the track could profitably be leased to the Grand Trunk Railway, connecting with their present lines, which would bring the traffic to be created down to Toronto and the western parts of Ontario. Merely to bonus a company after the usual fashion would leave them free to make the connections most profitable to the promoters and would probably result in our interests being sacrificed to those of Montreal.

A consideration to which the Premier did not refer presents itself as an additional reason in favor of public control in this instance, namely, the saving likely to accrue in the rates of transportation. The usual system pursued by railroad promoters is to build the line so as to cover the greatest mileage in the shortest time in order to be able to float bonds at the rate of $20,000 per mile. This increases considerably the amount upon which interest has to be paid out of the traffic, as the bonds usually have to be disposed of at a heavy discount. Other manipulations, such as the letting of contracts to construction companies, increase the load of liabilities which must in the end be borne by those who use the roads, in addition, when it is possible, to the payment of dividends to stockholders. Under government construction the amount might be greatly minimized if the traffic rates were adjusted so as to meet the actual cost of construction and operating expenses merely.

Another matter which ought not to be overlooked is the need of preserving from the ever present danger of fire the extensive pine areas of the Temagami Forest Reserve, estimated as containing about three billion feet, board measure. The railway will pass through the reserve and the pine forests immediately adjoining it for a distance of fifty miles. Railway construction under the ordinary system has almost invariably been attended by extensive forest fires, owing to the negligence of large bodies of men employed in the work. The value of this body of timber renders it only right that extraordinary precautions should be taken to guard against such a calamity, and it may be urged this can be done more effectively when the building of railroads is undertaken as a government work than if relegated to a company regardless of other interests than their own, of whom a formal and perfunctory compliance with set regulations would be all that could be expected.

While there is much to be said on both sides of the abstract question of the state ownership of railroads upon which the Premier wisely, as we think, refrained from entering, it must be admitted that the proposed Temiscaming railroad occupies a somewhat exceptional position, and that the magnitude of the interests involved may justify some departure from customary methods. Whatever may be the precise direction which this may ultimately take, we trust that the Legislature will support the position of administration in insisting that the development of the unsettled territory shall be pushed so as to secure the legitimate commercial interests of the people of this province, and that in railroad construction every possible safeguard shall be resorted to to prevent the diversion of the traffic into other channels.

THE DODGE CALCULATOR.

We are in receipt of a very ingenious device called the "Dodge Calculator," issued by Dodge Manufacturing Co., of Toronto.

The device is not only a novelty, but it is also an instrument of considerable value and assistance to all mechanics, foremen, superintendents, etc., whose duty it is to figure up speeds of pulleys, gears, etc. We are informed that the Calculator is one of the many uses to which the slide rule principle may be applied.

The Dodge Manufacturing Co. will be pleased to mail the Dodge Calculator free for the asking.

CORRESPONDENCE

OPERATION OF CIRCULAR SAWS.

WALTON, Jan. 11, 1901.

Editor CANADA LUMBERMAN:

DEAR SIR,—In reading over the opinions published in your January issue as to the merits of different types of saws, I was much interested in the letter signed "Oak." I would like to ask your correspondent what he considers the proper speed for a 9 gauge and 10 gauge circular saw, and to explain what he means by two guide pins, also state in what position he would place them with regard to the saw.

Yours truly,
L. MCDONALD.

ROSSEAU FALLS, Jan. 12, 1901.

Editor CANADA LUMBERMAN:

DEAR SIR,—In the letter signed "Oak" in your Jannary issue, the writer speaks of using two sets of guide pins for guiding thin circulars in cutting lumber. As I have had some experience with thin circulars, even down to 12 gauge, 68 inches diameter, upon which I tried the two sets of pins, but without satisfactory results, I would be glad to have particulars as to size of saws used and a simple sketch showing where the guide pins should be placed on the plate.

Yours truly,
ISA MUTCHENBACKER.

In reply to the above letters our correspondent at Rat Portage writes as follows:

"With regard to the best speeds to run a 9 and 10 gauge circular up to 60 inches in width, the speed that I found to give the best satisfaction is about 800 revolutions per minute. I have always asked the sawmaker to build or grind the plate one to one and one-half gauges thicker from the centre out to the rim. I never depend on the hammering that comes from the saw factories. I always change it to suit myself, and I find since I have used my own way of hammering that I always have good results, making good lumber, and seldom ever break a saw.

"We use 9 gauge saws in this part of the country (where 75 per cent. of the timber is red pine) with good results. In the east, where the logs are white pine, there should be no trouble in using 10 gauge. Red pine is much harder to saw with a circular, especially the butt-log, than any other kind of soft timber I know of.

"I may say that before we found out what was the matter with the saws coming from the factories, we had lots of trouble in the way of making bad lumber, and also by breaking saws faster than they could be shipped to us from the east. The difference now is that we do good work and break no saws, and make a larger cut per day.

"In reply to Mr. Mutchenbacker's letter, as to where I would place two guide pins on a circular. They are placed one below the log in the usual way; the other guide is placed above the log about four-fifths of the distance from the collar to the rim. This plan is used more where they have double mills with a band on one side and a circular on the other side, the larger logs going to the band and the smaller logs to the circular. One of the fastest mills in the world has adopted this plan. The one I have reference to is Heckley's mill in Minneapolis, where they are sawing more lumber in a day for the amount of plant and number of men employed than any mill in the world. The rate that a 10-gauge circular runs in that mill would surprise a man who has been used to thick saws. We are going to try two guide pins here the the coming sawing season in one of our double mills."

ADVANTAGES OF SUPERHEATED STEAM. — A recent authority thus sums up the advantages of superheated steam: First—A slight gain at the boiler, although a less gain than can be obtained by increasing the boiler heating surface, or by the use of an economizer. Second—A large gain in economy at the eugine, while as a disadvantage there is: Third—An increased loss in the steam pipes, due to increased radiation, fall of pressure and increased leaks. With from 500 to 700 degrees temperature of the steam, the following results were obtained:

	Per Cent.
Gain at boiler	2
Gain at engine	10 to 20
Extra loss in pipes	4½
Net gain	7½ to 17½

THE LATE W. H. HURDMAN.

The oldest and one of the most extensive lumber operators of the Ottawa Valley died on Wednesday, February 20th, in the person of William Henry Hurdman. For over half a century deceased was actively engaged in the lumber industry with his brothers, of which Robert alone survives. He was a son of the late Charles Hurdman, who emigrated to Canada from County Caven, Ireland, in 1818. The family settled in Hull township, where William was born the same year, he being the first child of old country parents born in this section of the Ottawa Valley.

At the age of 23 deceased, in 1841, took a contract with his brother Charles to grade a section of the Aylmer and Bytown Turnpipe road. Later in the same year he entered the lumbering business, drawing timber for John Egan, then one of the leading operators. He continued in this branch of the business till 1860, when he secured a limit, 50 miles in extent, on the Chalk river above Pembroke. This limit was worked for square timber till 1864. Mr. Hurdman next secured a limit on the Mattawa, part of one formerly owned by A. H. Baldwin. This was part of the old E. B. Eddy limits, and it is now worked by Mr. Hill. Square timber likewise was secured on this one, as the distance was too great to permit of logs being cut and hauled down.

In 1865 Mr. Hurdman secured a limit, 150 miles in extent, bounded by the Mattawa, Petewawa and Amable du Fond rivers. The present limits of Wm. Mackie, M. P., adjoins the old Hurdman limit. The square timber cut on this limit had to be drawn to the Ottawa river and there formed into rafts, which were floated down to Quebec by wind and current.

Mr. Hurdman was one of the first lumber operators to go up the north branch of the Petewawa river. This was in 1866, and work was carried on above Cedar lake. At this time the late Richard McConnell had limits alongside Mr. Hurdman's on the Petewawa. Wm. Morris, the late Andrew Irving, of Pembroke, and A. & P. White were operating on the south branch. That season the square timber rafted at the mouth of the Petewawa at the opening of navigation did not reach Quebec by way of Ottawa till September 29th. The following year, 1867, Mr. Hurdman pushed on still further and took out square timber on Hurdman's creek, a branch of the Petewawa river. He improved the waterways, but on account of the low water was unable to get his rafts of square timber to Quebec till the following season.

There were five of the Hurdman brothers, William being the oldest. The others were Charles, John, George and Robert. In 1857 the well known Hurdman farm on the outskirts of Ottawa, at Hurdman's Bridge, was purchased, and on this George took up his residence, farming in the summer and lumbering in the winter. He died last summer. The farm, which contains 160 acres, was purchased in 1857 for $2,700. The price now placed on it is $24,000. John Hurdman died in 1861, and the lumbering operations were carried on by William, Charles and Robert. They were known as "square timber men" till 1879, when they commenced taking out logs for the mill men. Previous to this, in 1872, they purchased limits on the Kippewa from John Wilson. In 1879 the partnership known as Sherman, Lord & Hurdman was formed. In it with the Hurdman brothers were T. E. Lord, of Albany, and Augustus Sherman, of Postdam, N. Y. The firm operated the Cromwell mill in the Chaudiere district, between Hull and Ottawa, the logs being cut by the Hurdman brothers on their limits. In this same year a limit was secured on the Coulonge. From the foregoing it can be seen that the Hurdmans were extensive operators. Each season they forwarded to Quebec four rafts containing about 500,000 cubic feet of white and red pine. The timber cut by them was always select stock, mostly white pine. The last square timber was cut in 1878.

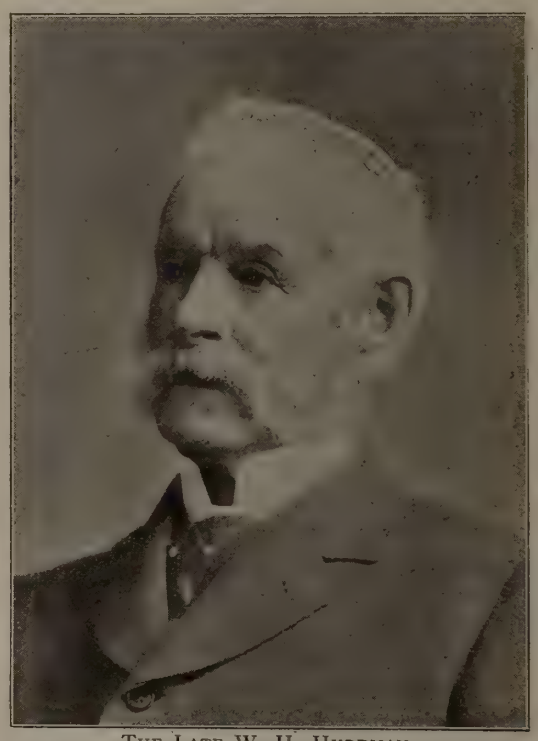
In 1879 Charles G. Hurdman, of Mattawa, and W. H. Hurdman, jr., of Ottawa, entered the partnership, buying out the share of their father, Charles Hurdman. In December, 1884, Sherman died and his son-in-law, Lemon Thompson, succeeded him in the business. About this time a yearly cut of 40,000,000 to 50,000,000 superficial feet was made. The firm was known as Lord, Hurdman & Co. till 1886, when Mr. Lord died. His share was bought out and the firm name changed to R. Hurdman & Co. Mr. Robert Hurdman acted as manager at the mill, and William Hurdman managed the "up river" business, assisted by his nephews.

Previous to Mr. Lord's death, however, the firm made extensive purchases of limits. These were situated on the Maganasippi on the Ottawa at Deux Rivieres, at Bois Franc, and on the Kippewa lakes up the Ottawa. Part of these limits were secured from A. & P. White and J. & G. Bryson.

In 1891 another change was made in the firm, when A. E. Buell, of Burlington, and John C. Orr, of New York, secured part interests. The firm name became Buell, Orr, Hurdman & Co. Other gentlemen who became identified with the business were W. G. White, Albany, F. W. Avery, Ottawa, and C. E. Read, Ottawa, son-in-law of W. H. Hurdman, the subject of this sketch. The latter retired, but was further identified with the Hull Lumber Company till 1896. Charles Hurdman died in 1893.

About this time the celebrated and complicated legal proceedings between the Hurdmans and the other parties mentioned were instituted. The Hull Lumber Company, it is said, was formed under protest from the Hurdmans, who claimed an interest therein, although not recognized as holding any interest by the other parties. The case was not settled till last March. One of the last acts of the late Wm. Hurdman, it is said, was to sign the final document in this celebrated case.

Mr. Hurdman was active despite his 82 years of almost continuous service in the lumber business. He was a man of unimpeachable character and stood high in the esteem of the hundreds who knew him. Up to 1873 he resided in the family residence on the Aylmer road. In that year



THE LATE W. H. HURDMAN.

he moved to Hurdman's Bridge, and in 1885 he took up his residence in Ottawa. He was actively identified with municipal politics and was reeve of Gloucester township and a member of the county council. He was a staunch Conservative, and at one time recognized as a lieutenant of the late Sir John A. Macdonald. Mr. Hurdman's intellect was clear and his powers unimpaired till the last.

The generation of lumbermen to which he belonged has narrowed down to few representatives. On the list at different times were Richard and Benjamin Rinaldo, Richard McConnell, John Egan, James and Robert Skead, Wm. Morris, Andrew Irving, Pembroke, John and A. Dunlop, Wm. Mackie, M. P., A. and P. White, Alex. Fraser, Wm. Faicuhney, Daniel McLachlin, P. Supple, Pembroke, John Poupore, R. H. and James Klock. Mr. Hurdman leaves a family of one son, W. W. Hurdman, of Hartford, Conn., and three daughters, Mrs. (Dr.) J. F. Kidd, Mrs. C. E. Read, and Mrs. (Rev.) H. H. Stevens, of St. Henri, Montreal. Mr. Geo. C. Hurdman, of the lumber firm of Hurdman & Elmitt, is a nephew.

The annual meeting of the Tracadie Lumber Co., of Tracadie, N.B., was held in Bangor last month, at which F. W. Hill was elected president, C. D. Standford treasurer, and H. B. Foster general manager. It was stated that prospects for this year's business are as good as could be wished for. The cut of logs this winter will be about 11,000,000 feet. These, it is expected, will be driven to the mill at a cost of $1.90 per thousand feet.

THE OTTAWA VALLEY.

[Correspondence of the CANADA LUMBERMAN.]

When King Edward VII visited Ottawa as Prince of Wales and heir apparent in 1860, he was given a royal welcome by the lumbermen. The arrangements were in the hands of Allan Gilmour, J. M. Currier, John Egan, and other well known lumber magnates, and they were carried out on an elaborate scale. The Prince came to Ottawa by steamer, and a few miles down the river he was met by a flotilla of canoes and river boats manned by about 500 lumbermen and Indians, who cheered lustily when the Prince appeared. These smaller craft raced the steamer up the river landing. Many of the canoes were built for the occasion, and the men, all of whom sported red shirts, were brought from a considerable distance. While in the city the lumber workers were entertained at the expense of their employers. Hugh bonfires were built and meals cooked and served to them in the open.

The following day the royal visitor and the members of his distinguished suite enjoyed the unique and exhilirating pleasure of a trip through the government slides at the Chaudiere on a raft of square timber. He afterwards witnessed a series of boat races. In these crews of assorted strength competed, two oar up to ten oar races being on the programme. The different lumber firms were represented by crews, and the keenest good natured rivalry prevailed. In one race an Indian crew won out, however, from the timber hewers.

The lumbermen also erected an immense and imposing arch near the Suspension bridge at the Chaudiere district, then as now the centre of the industry. This arch was built of square timber, as were several others erected on the principal streets. The future King was presented by Mr. Allan Gilmour with an address from the lumbermen and settlers of the Gatineau district. At the Chats rapids on his way to Arnprior the distinguished tourist was presented with another address on which were conveyed the loyal wishes of 13,000 river men and lumbermen. This presentation took place on a raft, and the address was written on birch bark. The address was unique from the fact that it contained the expression "may you long remain the Prince of Wales." The loyal river men while wishing the heir apparent all joy and a long life, thus showed their love for his royal mother, whose reign they desired to see long continued. The true hearted fellows had their wish realized, as the Queen reigned for another 40 years. At the time of the Diamond Jubilee one of the gentlemen interested in preparing the address and presenting it, forwarded another copy to the Prince of Wales renewing the sincere wishes of 1,860 therein contained. The Prince in reply stated that he remembered and treasured the circumstance of the first presentation, and would convey to the Queen the renewed loyal wishes of the Ottawa lumbermen. The Prince and suite were conveyed from the Chats rapids up the Ottawa river to Arnprior in canoes manned by hardy river men. At Arnprior this distinguished guest was entertained by Mr. McLachlin, whose name is also prominently identified with the lumbering interests of the Ottawa Valley.

CHECKING OF BASSWOOD.

A correspondent writes to the American Lumberman as follows: "Would you please give me advice as to how to keep basswood from checking both in logs and squares? I have tried different ways, such as putting in a shed out of the rain and sun and keeping it with the bark on it, but it does not seem to help the difficulty very much." The answer given is that painting the ends, if the prevention of checking is of enough importance to warrant the expense, will be the best means of overcoming the difficulty.

It is reported that the Ship Harbor Lumber Company, owned by the estate of the late Hon. A. R. Dickey, has been sold to a pulp-making concern.

W. E. Kelley & Company, of Portland, Me., are to start a planing mill to be operated by electricity, and expect it to be second to none of its size. The shavings exhauster is to be run from a countershaft; instead of tight and loose pulleys the motor will be connected direct to counter, so that when the machine is stopped the exhauster will also be idle. This construction is with a view to economy in not having to pay for extra power. There will not be a piece of shafting in the mill, except in the filing room, where one piece, 12 feet long, will be run by one motor, the filing room tools being belted from this shaft.

CANADA LUMBERMAN

WEEKLY EDITION

The Lumberman Monthly Edition, 20 pages } $1.00 PER YEAR { The Lumberman Weekly Edition, every Wednesday

THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN, THE UNITED STATES, AND OTHER FOREIGN MARKETS.

VOL. VII. TORONTO, ONT., MARCH 6, 1901 No. 6

CANADA LUMBERMAN

PUBLISHED BY

The G. H. Mortimer Publishing Co'y of Toronto, Limited

Confederation Life Building - TORONTO.

Branch Office:
IMPERIAL BUILDING, MONTREAL.

Weekly Lumberman, published every Wednesday. Contains reliable and up-to-date market conditions and tendencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canaian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

Lumberman, Montbly. A 20-page journal, discussing fully and impartially subjects pertinent to the lumber and wood-working industries. Contains interviews with prominent members of the trade, and character sketches and portraits of leading lumbermen Its special articles on technical and mechanical subjects areespecially valuable to saw mill and planing mill men and manufacturers of lumber products.

☞ Subscription price for the two editions or one year, $1.00.

WANTED AND FOR SALE

Advertisements will be inserted in this department at the rate of 15 cents per line each insertion. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed. This notice shows the width of the line and is set in Nonpareil type; 12 lines make one inch. Advertisements must be received not later than 4 o'clock p.m. on Tuesday to insure insertion in the current week's issue.

WANTED

Market for—
27,000 ft. 1 in. dry Soft Elm, mill run, culls out.
8,000 ft. 1½ in, dry Soft Elm, mill run, culls out.
5,000 ft. 2 in. dry Soft Elm, mill run, culls out.
32,000 ft. 1 in. dry Hard Maple, mill run, culls out.
13,581 ft. 1½ in. dry Hard Maple, mill run, culls out.
28,352 ft. 2 in. dry Hard Maple, mill run, culls out.
27,784 ft. 3 in. dry Hard Maple, mill run, culls out.
Prices on application. W. DOHERTY & CO., Clinton, Ont.

FOR SALE ONE CAR OF INCH DRY, 1ST and 2nds Hickory. WILSON LUMBER CO., LTD., Toronto.

WANTED—Position as Manager, Superintendent or Foreman of saw mill. Unexceptiona reference furnished as to experience and ability. Address P. O. Box 497, Ottawa, Canada.

WANTED — SOUND, CLEAR, WHITE Spruce, 1¼ inch thick, in 10 or 16 foot lengths. Dry stock preferred. Address MASON & RISCH PIANO CO., LTD., 642 King street west, Toronto.

FOR SALE.

Large Tract of Timber

THE PRORERTY OF

The Canadian Land and Immigration Company of Haliburton, (Limited).

This company has a larger tract of well timbered land about 125 miles north-east of Toronto. There are large quantities of Cedar, Hemlock, Spruce, Balsam, Basswood, Beech, Cherry Birch, Maple, also considerable Pine, Elm and Ash on this tract. It is well served by two railroads, one of which is about to be extended through the centre of the property. The company are prepared to sell this timber in blocks ranging from 5,000 to 10,000 acres, or more if desired.

There are several good mill sites on the property. This would be a good opportunity for parties who are at present cut out and are looking for a new location.

Maps and plans and further particulars can be had by applying to

W. H. LOCKHART GORDON,
Managing Director,
157 Bay Street, Toronto.

FOR SALE.—36 in. Wickes Gang, cutting 14 in. deep; located in Canada; price low. WICKES BROS., Saginaw, Mich.

WANTED.

ONE CAR OF PUMP LOGS, TAMARACK. Shipment in March or April. Correspond with R. J. DOUGALL, Hallville, Ont.

WANTED FOR BRITISH COLUMBIA

A MAN WHO UNDERSTANDS BUILDING and Carpenter Work. One who can run Sash and Door Factory preferred. Address, stating terms, experience, &c., LEQUIME & POWERS, Midway, B.C.

WANTED

GREEN HARD MAPLE SQUARES, 6½x6½ in., 12 feet and up. Cash on delivery at any station in Ontario or Quebec. Address Box 40, CANADA LUMBERMAN.

For Sale—The following Red Pine Lumber

120 M 1 in. x 4 in. and up x 6/19 ft., only 5% 6/11 ft.
25 M 6/4 in. x 4 in. and up x 12/19 ft.
207 M 8/4 in. x 4 in. and up x 6/19 ft., only 3% 6/11 ft.
Quality Log Run. Mill culls out. Cut 1900 For particulars apply to MASON, GORDON & CO., 589 Temple Building, Montreal, or Mason Mills, Ottawa.

FOR SALE

30,000 ft. 1½ in. soft and hard elm, cut last June.
7,000 ft. 1½ in. soft elm, cut last June.
6,000 ft. 4 in. elm " "
10,000 ft. 1½ and 2 in soft maple, cut last June.
20,000 ft. 1 in. soft maple, cut last June.
4 000 ft. 1½ in. red oak, " "
30,000 ft. hardwood, mill cut mostly, 1 in. and 1½ in., cut last June.
50,000 ft. dry 1 inch pine, mill run and dressing and better, cut last June.
Also a large quantity of dry cordwood and hardwood slabs.
Address STEELE & GIBSON, Humberstone, Ont.

Virgin Timber Berths

BY AUCTION

TOWNSHIP OF "ERMATINGER"

(North Shore of Lake Huron)

The Timber Licenses for the above Township will be offered for sale by Public Auction, on

Thursday, April 18th, 1901, at 2 p.m.

At the Board of Trade Rooms, Toronto,

subject to the terms and conditions which will be announced at the time of sale.

Lot 1.—The South-East Quarter of the Township, 9 square miles, more or less.
Lot 2.—The South-West Quarter of the Township, 9 square miles, more or less.
Lot 3.—The North-West Quarter of the Township, 9 square miles, more or less.
Lot 4.—The North-East Quarter of the Township, 9 square miles, more or less.

The Township of Ermatinger is one of the best berths in the province and can be cheaply lumbered. It has been recently examined for the owners by James Barclay, Cheboygan, and the estimates will be furnished to lumbermen who wish to examine the berths.

Terms of payment.—One fourth in cash at the time of sale, and the balance in one, two and three years with interest at 6 per cent. per annum, payable annually.

For further particulars and maps, apply to E. R. C. Clarkson, Ontario Bank Chambers, or to

PETER RYAN,
Toronto.

WANTED—A FEW CARS OF DRY PINE lath, No. 1 or good No. 2; also hemlock lumber—for spot cash—on C.P.R. points preferred. Box 17, LUMBERMAN.

WANTED--POSITION AS BAND SAW FILER. Capable of taking charge of same. Can give good reference as to experience and ability. Address MEDERIC LAFONTAINE, Charlemagne, Que.

A BOOK-KEEPER IN CHARGE OF A LARGE lumbering office desires to make a change; good reasons. Will be open for engagement April 1st. Best references furnished. Apply Box 207, Barrie.

WANTED— PARTY WITH $2,000 WANTS interest in a good saw mill, or a small mill with established business to buy. Will entertain any scheme in the way of lumber manufacturing. Give full particulars. Address W. B., CANADA LUMBERMAN.

WANTED TO REPRESENT LUMBER FIRM, either British Columbia or Ontario, commission or salary, by man experienced twenty years. Having experience in both provinces as well as the American grading Address Box 20, CANADA LUMBERMAN.

FOR SALE.

A LARGE QUANTITY OF GOOD SOUND Tamarac lumber in standard sizes, 2x4, 2x6, 2x8, etc.; Dimension timber, 16 ft. long, 4x4, 4x6, 6x8, 8x8, etc. Also other sizes cut to order. Apply to EDWARD LLOYD, Limited, Sturgeon Falls, Ont.

WANTED

FOR IMMEDIATE SHIPMENT, BIRCH LUMber, Dry—two cars each 1 in., 1¼ in. and 1½ in.—half car each 2½ in. and 3½ in. Will buy common and better, but width must be all seven inches and wider. Address with price, and state point of shipment. THE BRITISH CANADIAN TIMBER & M'FG. CO., Limited, Kearney, Ont.

1000 CEDAR POLES WANTED

FOR DELIVERY AT CORNWALL, ONT., and Milleroches, Ont., not later than May 1st, 1901. Write giving price per pole for good merchantable poles 7 in. tops, of the following lengths: Fifteen, 50 feet; 25, 45 feet; 50, 40 feet; 750, 35 feet; 60, 30 feet and 100, 25 feet. Address T. PRINGLE & SON, Montreal.

FOR SALE.

JAMES BROWN,
Acton, Ont.

FOR SALE

Three-quarters of a Million feet of Birch to be cut to order. This Birch must be sold log run culls out. Apply at

H. LAPOINTE & CIE,
Montreal.

TIMBER LIMITS SALE.

Persons in the market for timber limits will be given an opportunity of purchasing valuable berths on Tuesday, April 18th, when Mr. Peter Ryan will offer for sale by public auction virgin limits in the township of Ermatinger, on the north shore of Lake Huron. These comprise four lots of nine square miles each, being one of the best properties in the province. The sale will take place at the Board of Trade rooms, Toronto, at 2 p.m. on the date named, and should bring together a large gathering of lumbermen. The advertisement of the sale appears in another column.

CURRENT TRADE CONDITIONS.

ONTARIO.

The severe weather has not been conducive to a heavy demand for lumber, and such buying of small lots as has taken place has been chiefly for filling up purposes. Retail dealers are apparently keeping out of the market until they are better able to estimate the volume of the year's building operations. The fact is generally admitted, however, that both retailers and consumers are carrying light stocks, and that sooner or later they must add materially to their stocks. From a wholesale standpoint the volume of business is quite encouraging. Sales are being made freely for shipment by vessel upon the opening of navigation. One transaction reported involves ten million feet of lumber, but, while generally credited, the details have not been learned. Logging conditions in the pine districts are most favorable, and the outlook is that nearly all operators will succeed in getting out their contemplated cut. The hardwood situation is but a repetition of past weeks. The consuming industries are operating to their full extent, but are evidently deferring the purchase of their lumber supply in the hope of getting some concession in price. Whether or not they will be succesful in this depends entirely upon the hardwood manufacturers, who up to the present time have positively refused to yield. Lath and shingles are strong. At Georgian Bay points as high as $2.75 is being asked for No. 1 lath and $2 for No. 2.

QUEBEC AND NEW BRUNSWICK.

The outlook for spruce lumber seems to be improving as the season advances. Representatives of Quebec houses are meeting with considerable success in effecting sales in Great Britain, and there now seems to be reason to believe that about the usual quantity will be marketed there. There is a greater number of enquiries for stock from the Eastern States, especially for clapboards and shingles. Cedar shingles, on Boston rate of freight, are generally held at $2.85 to $2.95 for extras, and $2.60 for clears, although as might be expected, sales are being made below these figures by dealers who are anxious to realize immediately. Logging operations are proceeding satisfactorily, although in some parts of Nova Scotia deep snow is interfering with successful work.

MANITOBA AND BRITISH COLUMBIA.

The demand for lumber in Manitoba and the Territories is showing more ac-

tivity, due to the improved outlook for building operations. In Winnipeg a number of quite important buildings are projected, and in smaller towns and villages the volume of building promises to be greater than last year. British Columbia shingle manufacturers report that the consumption of red cedar shingles in the east is on the increase and that orders are coming in freely for spring and summer delivery. The demand from Manitoba is quiet and will be inactive until good crops are assured.

Current quotations for red cedar shingles delivered in Ontario are as follows: No. 1, 6 butts to 2 inches, $2.75 per M; No. 2, $2.25; No. 1, 6 butts to 2 3/16 inches, $2.90.

UNITED STATES.

The volume of trade in white pine lumber has shown a decided improvement during the past week. Heavy sales have been made at Duluth, Ashland and other points, the buyers being from Chicago and eastern wholesale distributing points. It is estimated that by the opening of navigation there will be practically no dry lumber at Duluth, while the recent sales have included much of the coming season's cut. The demand for building materials for immediate consumption has been confined largely to the coarser grades. The supply of box lumber seems to be comparatively heavy, but a scarcity of cutting up stock is still reported from Buffalo. The secretary of the Buffalo Lumber Exchange has compiled statistics which, in comparison with one year ago, show a shortage of 14,000,000 feet in white pine and 6,000,000 feet in Norway. Shingles and lath are both firm and high in price, with a tendency towards higher values, especially for white pine lath.

There is an apparent improvement in the hardwood trade, although prices are not altogether uniform. Red birch is scarce, and commands $30 to $32 on cars at Buffalo. Quotations on Albany rate of freight are $40. Brown and white ash are also firmer, the former selling at $26 to $28 for No. 1 and 2, and the latter at $30 to $32 for inch firsts and seconds.

GREAT BRITAIN.

Business in the timber trade in Great Britain is less active than at the corresponding period one year ago. Negotiations are under way, but shippers are finding some difficulty in closing contracts. This applies particularly to pine, as importers apparently believe that, considering the stocks on hand, the prices asked are too high. Nevertheless, shippers seem to be a unit in holding out for their present asking prices, even if such a course should restrict the volume of business. Spruce is selling now more liberally at good prices. Sales of 3x9 third regulars have been made at £8 10 shillings per standard c. i. f. London, and 3x7/8 inch battens at £8. The consumption of lumber at the leading ports is about normal for this season of the year. Large quantities have been sold by auction and have brought fair prices; 3x11 first pine sold at £22 to £23; thirds at £13 10s; and a parcel of Quebec pine boards at £25. First quality Quebec spruce, 3x9 brought £11 10s; second quality £9 15s to £10, and 3x11 thirds £9 5s.

STOCKS AND PRICES.

Kent & Campbell, of Duluth, last week sold 7,000,000 shingles to the Arthur Gourley Company, of Chicago.

The schooner Prohibition has just sailed from Sydney, N. S. for Demerara with a cargo of 156,000 feet of lumber.

The steamer Alatina is loading lumber at Hastings, B. C. for the Orient. She will carry about three million feet.

The base price for Hemlock in New York continues at $14.50. For 10 and 12 inch boards $15 can be obtained.

A two mile timber berth on Young's Brook Gloucester county N. B., was sold by the New Brunswick Government last week to J. J. Riordon at $85 per mile.

With the old logs being carried over, the Holland & Emory Lumber Company, of Bying Inlet, Ont., expect to have 50,000,000 feet of logs for the coming season's operation.s

The Saginaw Lumber & Salt Company expect to have 20,000,000 feet of logs to take over from the Georgian Bay to Saginaw this season. These were cut in Indian reserve lands.

No. 1 pine piece stuff is selling in the Chicago market at from $14 to $16, 6 inch No. 1 strips at $20, 4 inch at $17.50, and No, 1 Norway strips at $18. There is a scarcity of all grades of good lumber.

The Eastern Lumber Company, of Tonawanda recently purchased 2,000,000 feet of C selects and better from the Bay Shore Lumber Company, of Marionette, Wis., and 1,500,000 feet of same stock from the Sawyer—Goodman Company. These two deals involve a consideration of $140,000.

In the Barbadoes market according to Clairmonte, Mann & Company, there is a good demand for both spruce and white pine lumber. Latest sales have been made at $24 for merchantable pine, and $18 for second quality; $21.50 for merchantable spruce, $17.50 for second quality. The

FOR SALE! FREEHOLD PULP WOOD LANDS AND TIMBER LIMITS

About 85,000 acres of Freehold Lands, all within 50 miles and west of the City of Quebec, along the lines of the Grand Trunk and Intercolonial Railways.

All pulp wood can also be delivered by rail or driven by water to the River St. Lawrence and shipped thence by boat.

These lands are most favorably situated as regards low rates or railway freight to all points reached by above mentioned railways and their connections.

Also 217 square miles of limits on the North Shore of the River St. Lawrence, below Quebec, and 155 square miles, the logs on which latter limits would go to the Bay des Chaleurs by the Restigouche River.

WINNIPEG FORESTRY ASSOCIATION.

THROUGH the efforts of Mr. William Stewart, chief forester for the Dominion, a forestry association has been formed in the city of Winnipeg. At the organization meeting held last month a paper on "Trees for Shelter Belts" was read by Mr. H.P. Stevenson, of Nelson. He said that as far as Manitoba and the Territories were concerned, what is most needed is not large forests, but small groves and shelter belts for buildings and gardens, with desirable ornamental trees and shrubs to make our homes beautiful and attractive. The rule to be followed should be to begin by planting native trees.

Mr. E. Stewart outlined the forestry system which is proposed by the Dominion Government. A very important timber reserve, he said, is that of the Riding Mountains. Forty-five townships are reserved—nearly a million acres. If these were denuded of trees the Assiniboine would be dry in summer and a torrent in spring. In the foot hills of the Rocky Mountains there is another reserve. These reserves, he thought, should be set apart by act of parliament. Irrigation would be worthless without the forests. There would be floods in spring and drouth in summer. Other reserves are in the Moose Mountain and Turtle Mountain. One of the main features in the proposed Dominion system would be instruction. Any person wishing to avail himself of the co-operation system should make application to the department at Ottawa, and the supervisor would tell him how to prepare the soil and where and when the trees should be planted.

An address was also given by Mr. S.A. Bedford, superintendent of the experimental farm, Brandon.

On the motion of Rev. Dr. Bryce, seconded by Ald. Barclay, it was resolved that a forestry association be formed, to be called the Winnipeg Forestry Association, and to be open for membership to all parts of the province.

The constitution of the Canadian Forestry Association was provisionally adopted.

Nineteen names of the members were then enrolled and the following officers elected: Hon. president, Lieut. Governor McMillan; president, Rev. Dr. Bryce; vice-president, Mr. A. P. Stevenson, of Nelson; secretary-treasurer, Mr. G. H. Greig; directors, Messrs. D. W. Buchanan, C.J. Thompson, of Virden; F. Schultz, of Baldur; E. F. Stephenson, Wm. Martin, Ald. R. Barclay, and R. T. Riley.

A meeting of the executive committee of the above association was held on February 21st. There were present Dr. Bryce, president; G. H. Greig, secretary; Ald. Barclay, C. J. Thompson, of Virden, and E. Stewart, representative of the Canadian Forestry association.

The matter of extending the forest area of the province was considered, when it was unanimously agreed to request the Department of Interior at Ottawa to increase the spruce woods reserve south of Carberry by reserving the land belonging to what is known as the Sand Hill region as a large central Manitoba park, and to ask the Dominion government, under its new forestry policy, as soon as feasible to undertake the planting of the park with white spruce, Banksin pine, Scotch fir, or other suitable trees in the same manner as was done on the Sanddunes along the coast of France for 150 miles and from two to six miles wide.

A committee consisting of the president, the secretary, Ald. Barclay, R. T. Riley and Wm. Martin was appointed to wait on the local government and educational authorities to ask that more systematic steps be taken to secure general observance of Arbor Day throughout the country, and especially by the schools of the province.

The matter of scattering literature widely throughout Manitoba and the Territories for the inculcating of the value of preserving the forests, and also of giving instructions as to how to grow the trees on the prairies, was discussed. It was unanimously agreed that this should be done and every effort put forth to support the new movement of the department at Ottawa.

A meeting of the Winnipeg association will be held near the end of March, when all members are expected to attend, and new members may join the association by sending an application to Mr. G. H. Greig, the secretary, enclosing on dollar.

THE CANADIAN FORESTRY ASSOCIATION.

THE second annual meeting of the Canadian Forestry Association will be held at Ottawa on the 7th March next, commencing at ten a.m. The morning and afternoon sessions will probably be held in the Railway Committee Room of the House of Commons, as last year, and the evening session will be held in the Assembly Hall of the Normal School.

A very interesting programme has been arranged for this conference. The chief feature of the evening meeting will be a lecture by Dr. C. A. Schenck, principal of the School of Forestry at Biltmore, North Carolina, on "Governmental and Private Forestry," which will be illustrated by stereopticon views.

The following papers have already been promised:—"Forest Insects," James Fletcher, LL. D., Dominion Entomologist, Ottawa; "Forestry in British Columbia," J. R. Anderson, Deputy Minister of Agriculture for British Columbia; "Forest Management in New Brunswick," W. P. Flewelling, Deputy Surveyor General for New Brunswick; "The Pulp Industry in Relation to our Forests," J. C. Langelier, Superintendent of Forest Reserves for Quebec; "White Pine and its Economic Management," John Bertram, Toronto; "Forestry and Tree Planting in the West," E. Stewart, Dominion Superintendent of Forestry.

Other papers are being arranged for that will cover, as far as possible, the whole scope of the Association's activities, so that the report of proceedings may give a general view of the present position of forestry in Canada. The North-West will receive special attention.

The railway companies have repeated their great kindness of last year, and the Canadian Pacific, Grand Trunk, Canada Atlantic, Ottawa & New York and Intercolonial systems have agreed to allow members of the Association and their wives, when accompanying them, attending the annual meeting from points east of Fort William, return passage at single fare, provided a certificate is obtained from the agent at the point where the ticket for Ottawa is purchased, which must be signed by the secretary of the Association at Ottawa. This privilege will only be allowed commencing three days before the meeting and three days will be granted after the meeting to take advantage of the free return. Special arrangements may be made for members from western points if they will advise the secretary immediately of their intention of being present.

The secretary should be notified regarding any papers, resolutions or other matters of importance requiring discussion which any member may wish to bring before the meeting, in order that arrangements may be made for giving them consideration. The secretary would also like to have information of any experiments or observations in tree planting or forestry which have been made by members of the Association or others.

The importance of the subjects to be discussed and the interest of the papers to be submitted should ensure a large attendance. A successful annual meeting will give a great impulse to the work of the Forestry Association, and will do much to establish it on a firmer basis and to advance the great objects it has in view. It is hoped that every member will make a special effort to be present.

FORESTRY AT BUFFALO.

Forestry will receive special attention at the Pan-American Exposition to be held in Buffalo this year. The exhibit will contain much that is interesting and beneficial to the general public.

The propagation, care, and preservation of forests has received a great deal of attention from the United States Government of late years. The United States division of forestry, under Gifford Pinchot, has made an unusually generous offer to all farmers or persons wishing to improve forests or plant wood lots. An expert will be sent upon application, at the expense of the Government, who will make an examination of the soil, climatic and atmospheric conditions, after which he draws up a plan for planting. He also instructs the farmer and his neighbors so far as possible in the elements of forestry. In the main this takes up the question of the proper kinds to plant in a particular soil and locality, the manner of planting and proper care of the trees until they attain maturity.

One of the most interesting features will be an illustration of the manner in which the mat of fallen leaves which covers the ground in the forest absorbs the rain as it falls, instead of permitting it to course down the hillside, to join the brook which helps to swell the river to overflowing.

Distribution of moisture will be made plain, as the work is done in the great chemical laboratory of nature—how the wet surface of leav operates as an air-tight covering to prevent undue evaporation, while the myriads of tiny tree rootlets take up the water as it slowly percolates through this covering into the soil, from whence it is raised by a mysterious capilliary force, through the trunk and branches to the leaves, where it is given off in the form of vapor through transpiration, to be once more precipitated to the earth in the shower or dew that waters the growing crop.

The forestry exhibit will be the special care of Supt. Frederic W. Taylor and will be housed in a building which of itself will be an interesting exhibit. With splendid natural resources to draw from, and the advanced knowledge of forestry as a help, it is the intention to make this the most interesting and practical forestry exhibit ever brought together.

THE SHAPE AND SPACING OF BAND SAW TEETH.

By "MILLMAN."

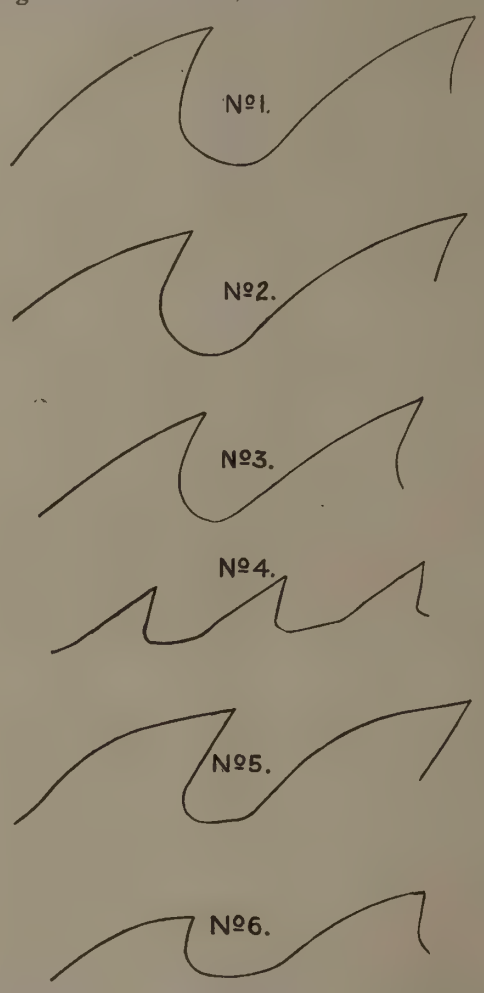
A man that should undertake to collect and illustrate all the various shapes of band saw teeth would have an almost endless job upon his hands, but he would have a most interesting collection and a wonderful variety of shapes, and perhaps every one of the essentially different shapes would have a saw filer to vouch for its special adaptation to his work. Years ago, when the bandsaw was a new device, the teeth were spaced from 3 to 4 inches and speeded about 4,000 to 5,000 feet per minute. Then presently the spacing was reduced quite generally to about 1 to 1¼ inch and the speed increased a thousand feet and more, but with the increase in speed the spacing was increased to 1½ or 1⅝ or 1¾-inch, and for fibrous woods to 2-inch. I have known band saws to be run in white and Norway pine with a 2½ inch spacing, in late years, but this was really an experimental test and the filer soon knocked out every other tooth and found the 1¼-inch spacing distinctly preferable. Now, regarding general principles that should govern shapes of teeth, there are a few to which the majority of filers will assent, and these may be itemized as follows :

(1) A longer spacing for teeth run at a high speed than for those run at a slow speed. (2) High speed, with plenty of hook and good throat room, insures the highest work. (3) More hook for soft than for hard woods. (4) Longer teeth for soft woods and summer sawing than for hard woods or winter sawing. (5) High speed with teeth close together make fine dust, and this will not pocket well in the gullets of the teeth. (6) Faster speed for soft than hard woods. (7) Faster speed for unfrozen than for frozen timber. (8) A saw with teeth all perfectly fitted and each doing its share of the work may have longer spacing than if otherwise fitted.

There are localities in which a similarity of shapes in general use prevail, and on this point my observation or information is as follows : In the Pacific northwest a 2 inch spacing with gullet ⅞ or 1 inch deep. To produce this tooth an emery wheel must be used ranging from ¾ to ⅞ or 1 inch thick, with edge shaped to produce the base outline preferred. The same, or a 1¾ spacing, in California. In the cypress of the south, a 1¾ spacing, with a horizontal base line for gullet, has been very common. In the hardwoods of the middle south or the north, a 1¼ to 1½ spacing, with a ⅝ gullet. In the northern white pine and hemlock, spacing of 1½ to 1¾, with a ¾ gullet. In the cottonwood districts a 1½ spacing with extreme hook of 8 to 10 inch in 12. The above is a generalization merely, and from any of these general types may be found radical deviations in each locality.

It is an indisputable fact that changes in the shape of teeth more commonly employed are going on, and these changes are in the direction of more hook, a consequently necessary higher back, a round gullet deviating but little from an almost true circle, rising easily to the crown of the back, and an approximate depth of ¾ for 1½ spacing, ⅞ for 1¾ spacing, and 1 inch for 2-inch spacing. The hook of these teeth ranges 6 to 9 inches in a 12-inch saw, rarely more, and where more hook is claimed, it can be measured only on the face of the swaging and note below. There is such a thing as too much hook, for the more hook the higher the back required to afford proper strength for the tooth, and there is an obvious limit to the height of the back. The competent filer in adopting a shape for his saw teeth will be governed by his personal experience and that of other successful filers. He does not need to adopt some abnormal tooth, difficult to produce even with the most adjustable sharpener, difficult to maintain when produced, without constant dressing of the emery wheel, difficult to swage and sidedress because of its pitch and hook, and in no way effective except as an illustration of an extreme idea. However, it is probable that some filers hold their jobs on the strangeness of their saw teeth, and more probable that a greater number "get the run" for the same reason.

To produce any shape of saw tooth, two things are essential : A good, adjustable and accurate working sharpener and an emery wheel of suitable grain and hardness, dressed for the work.



This wheel may be straight or concave, round or bevel edged, but must be distinctly one that will hold its shape with least possible wear during the feed of the saw once around. Uniform shape or sharpening of teeth cannot result when the filer stands at the machine adjusting the wheel more or less to the face or back, every few teeth. And really, after all, the matter of hook, spacing, shape of gullet and speed of the saw are probably less important than the swaging, sharpening and shaping of the teeth. Teeth of a length, sharp, with corners perfectly cleared and uniform, are what you want, and any filer who doesn't work close on these elements, absolutely essential to good cutting, may better develop expertness in these directions, and chase the other phantoms later on.

There are filers whose saws make big cuts, the styles of teeth used being as diverse in hook, spacing, depth and outline of gullet as the possible extremes in these guards. Based on results, you may assert that any one of these various outlines in use is the best, but keep carefully in mind that the saw which does the best work is running on a mill with perfectly faced wheels, sensitive straining device, solid foundation, carriage in line, guides set right, and is controlled by an expert sawyer. Also that the saw is made of good steel, is expertly tensioned, perfectly fitted, and that it cuts fast and true, because all the necessary conditions that contribute to these results have been met.

Referring to the shapes of saw teeth outlined herewith, a little comment may be of interest. Tooth No. 1 is from 14½-in. by 60-ft. 14-gage band, and No. 2 from the band resaw in a British Columbia saw mill cutting fir and spruce, and affords perfectly and satisfactory results. Tooth No. 3 is from a 12-in. by 51-ft. 16-gage band saw that drops twelve 12-in. by 16-ft. boards per minute on good logs out of the Mississippi river. In this mill there is another band saw used, 11-in. by 45-ft., 14-gage, with same style of tooth, that drops 16 boards of above size per minute. Both saws are sharpened on the same sharpener and five gages of clearance used. The filer in charge of this saw-fitting comments regarding these saw teeth as follows : "I always regulate the spacing and depth of teeth according to the speed of the saw, kind and quality of the timber, whether frozen or not, very knotty, many boom plugs, gravel or shells, whether canting or sawing up, but there is a happy medium that will do the work for nearly all, except white oak, hickory and iron, and tooth No. 3 shows this outline, a tracing off my saw, and a tooth on which I will stake my reputation. In different mills I have run this tooth in white and Norway pine, hemlock, cottonwood, elm, sycamore, basswood, ash, wild cherry, frozen red spruce, yellow pine, balsam fir and mountain white pine, and with proper clearance for the timber being sawed, it is a free, easy cutter and stiff enough for anything. We run into more or less spikes, stones, etc., and if I had a longer spacing it would necessitate a piece in the saw. If I were filling in the real cork pine, free from boom plugs, gravel, spikes, etc., I should run the saw about 11,000 feet per minute, and carry a 2-inch spacing one inch deep, just the same shape. The principal thing in shaping saw teeth is to have plenty of hook, so that the teeth will cut, a round gullet aad plenty of strength. The faster the feed, the more sawdust room, for you can't split a log with a saw. In most cases the teeth have a larger capacity than the tension, and then they commence changing the teeth the first thing, and get them into such shapes that the grinder has to be a contortionist to follow their lines. Whilst this tooth of mine may not be the best in the world, it is a good one, and will do anyone's work if given a chance."

Tooth No. 4 shows the shape used for band resaws in the same plant. Tooth No. 6 is an outline desired by English or German band mill builders, and the sharpeners, swages, and shapers shipped for export for these concerns go adjusted to work on this template. The band saws rarely exceed 5 or 6 inches wide, and about 16 gage, and cut variously the European hardwoods, Canada and Swedish deals, yellow pine and the cabinet woods of the tropics. To the American the tooth seems undesirable, but it is found satisfactory by the operators, and this is the test. Tooth No. 5 is one of twenty or more templates submitted by a leading saw manufacturing establishment, for which a right hand and a left hand double cut sharpener was required.

Finally, if you must be an enthusiast on the shape of teeth as regards spacing, hook, gullet, etc., don't expect a special choice in this respect will allow you to run your saws successfully with backs hollow, improper tension, crooked guide rail, crooked piston rod, top wheel titled back so that the saw has to keep climbing over the front edge, too much swage, imperfect sharpening and sidedressing, etc. Vigilance at every point is the only guarantor of success.—The Wood-Worker.

THE NEWS

—Manning & McClure will build a new saw mill at Tulon, Man.

—Charles Smith, of St. John, is building a saw mill at Musquodoboit Harbor, N.S.

—A Minnesota lumber firm is said to have decided to build a saw mill in Winnipeg.

—McCracken & Barnes, of Lowe, Que., are changing their saw mill to steam power.

—Dion & Gregorie, of Acton, Que., have formed a partnership as lumber dealers.

—William Hoard will erect a steam saw mill near Barwick, Ont., on the Rainy river.

—It is understood to be the intention of Thos. Higgins to erect a saw mill at Brookfield, N.S.

—Thos. Lebel has disposed of his saw mill at Fraserville, Que., to Price Bros. & Company.

—Chew Bros., of Midland, Ont., are building an addition to their saw mills at Dollartown.

—James Barner is about to commence the reconstruction of his saw mill at Gordon Bay, Ont.

—The Nipissing Lumber Company, of Hamilton, has been incorporated, with a capital of $44,000.

—T. G. Hawthorne has registered as manager of the American Axe Company at Three Rivers, Que.

—The saw mill of James E. Mattinson at Lower Stewiacke, N.S., has been sold to G. M. Mattinson.

—The saw mill of Hugh McDonald at Hopewell, N.S., will be offered for sale by public auction on March 4th.

—The Rathbun Company, of Deseronto, are negotiating for the erection of a saw mill at Fenelon Falls, Ont.

—No decision has been reached as to the rebuilding of the old Barnhill saw mill at Pleasant Point, near St. John, N. B.

—J. &. T. Conlon are making improvements to their mill at Little Current, Ont., by which its capacity will be increased.

—The Buffalo Hardwood Lumber Company, of Buffalo, have opened an up-town office in the Prudential Building in that city.

—A large saw mill is being built at Musquodoboit Harbor, N. S., to replace the one destroyed by fire a short time ago.

—The Dominion supplementary estimates contain an appropriation of $50,000 to provide facilities for floating logs down the St. Maurice river, in the province of Quebec.

—Buchanan & Son, planing mill owners, Goderich, Ont., have admitted John Lawson, of Dunlop, as a partner, and the firm is now known as Buchanan & Lawson.

—The large saw mill built at Fernie, B. C., by the C.P.R. is being moved to the coast. It was found that the plant was not suitable to the class of timber available in the interior.

—Colin Reid, of Bothwell, Ont., purposes exhibiting at the Glasgow exhibition a sample bulletin board containing a number of different kinds of Canadian finished woods.

—W. H. Bennett, M. P., has given notice that he will introduce a resolution in the Dominion Parliament providing that an export duty be imposed on all saw logs cut on Indian reserves.

—Robert Milligan, of Wallaceburg, and David and John Milligan, of Fesserton, have purchased David Hadden's mill at Foxmead, Ont., and intend to manufacture lumber, staves and hoops.

—It is said to be the intention of J. A. Sayward, of Victoria, B. C., to remove his mill from Pilot Bay to Nelson, by which he will be enabled to more readily supply his trade in Manitoba and the Territories.

—The McArthur Export Company, Limited, has been incorporated, the promoters being Peter McArthur, of Detroit ; John Sharples, Wm. Price, John P. Ross, and F. W. Ross, of Quebec. The capital stock is $200,000.

—A Chattanooga party has secured a patent on an invention for staining lumber in the log. The staining materials are forced through the log by hydraulic pressure, with the result that the log comes out of the process evenly stained all the way through.

—The Rat Portage Lumber Company have their new lumber yard in Winnipeg in running order. The office building is finished in white pine ceiling, varnished, and presents a bright and attractive appearance. The shed is a double shed, 290 feet long, or equal to a single shed of 580 feet. A spur line of railway will run through the yard and along one side of the shed. It is the intention to carry a large stock of pine, also B.C. fir, spruce and cedar, red and white oak, basswood, maple flooring, etc.

CASUALITIES.

Fred Truesdale, working in the Rathbun timber limits, north of Marmora, fell upon the upright handle of his axe and received severe injuries.

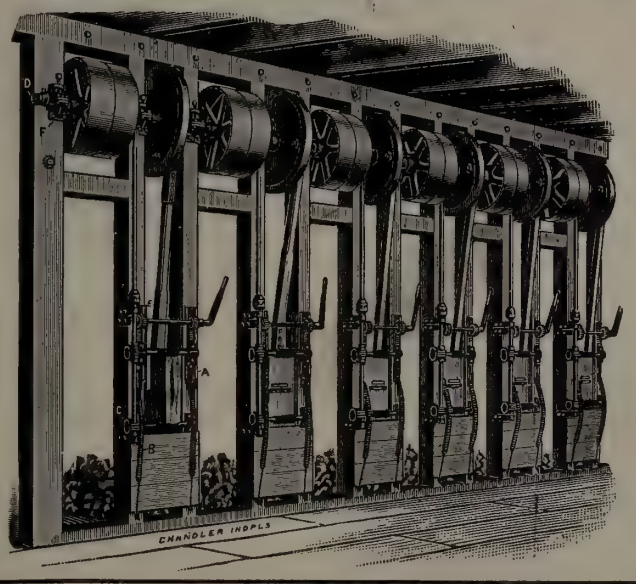
While at work in McKinnon's saw mill at Cedar Valley, Ont., Colin Patton slipped and fell backward across a circular saw, received such injuries as to cause his death a few minutes afterwards.

James Judge, a well known resident of Toronto, was killed a few weeks ago in the lumber woods at Fowke's river, one hundred miles north of Sudbury. Deceased was driving a team of horses, when the logs swung off a skidway and crushed him.

A Sturgeon Bay, Wis., item in a Detroit paper says A. W. Lawrence has the distinction of being the first man to own and operate a saw mill, the motive power of which is a gasoline engine. It has recently been set in operation in Menominee county, and when run to its full capacity will cost $5.00 per day for fuel. As an offset to this expense, both engineer and fireman are dispensed with. The slabs ordinarily used for fuel are also saved, and this placed on the market will bring more than the cost of the gasoline.

Tests reported by R. S. Hale to the Engineering Magazine indicate that leakage from steam pipes is probably greater than generally believed. In plants using ordinary amounts of piping, he finds the proportion of steam lost to be 6 to 16 per cent. in mills ; 2½ to 7 per cent. in electric plants ; 1½ to 10 per cent. on steamships, and 2½ per cent. in water works. The percentage lost seems to depend on whether the plant is worked up to its full capacity. If the electric plant with a loss of 7 per cent. is working at one-third of its capacity, the loss is 21 per cent. of the steam actually used.

The Best Excelsior Machine in the World



When two or more knives are run with one belt, all must stop when the belt is stopped to set bits or from any other cause. Our Machine has a belt for each knife, hence but one knife stops at a time. This great advantage should not be overlooked by purchasers. Time is money. Our Machine cuts more excelsior in a given time than any other machine. Get our circulars and prices.

WOOD PULP DEPARTMENT

THE FIRST FLAX FIBRE PULP MILL.

WHAT is understood to be the first mill in the world to produce flax fibre is now nearing completion at Niagara Falls, N. Y., the owners being the French-Hickman Flax Fibre Company. The process is covered by patents, and consists of the making of chemical pulp from straw, or as termed by the inventor, flax, in such a manner as to be equal to any other pulp for the use of fine papers and boards. It is claimed that it can be made as cheaply as other chemical pulp, is clean, and has a closer fibre.

The flax straw is secured from North Dakota in bales, and is taken from the cutting room to the digesters, where it is cooked in a way somewhat similar to that used in the soda process. The product is then blown out into the blow tanks, where the liquor is drained off through a system of rotary furnaces and the pulp pumped to the washers. After being thoroughly washed it goes to the bleaching tanks, from which it is taken to the beating engines and prepared for the machine.

The main buildings are flanked on the long sides by railroad tracks. On one side the flax product is received, while on the other it is turned out as pulp ready for shipment. The interior arrangement shows a thorough economy of space for the best results. The raw product comes into the main building on carriers and first goes to the digester room. This is a two-storey room, 52 x 72 feet. There are in it five digesters, each 9 feet in diameter and 16 feet long. They were made by the Pusey & Jones Company, of Wilmington, Del., and have a capacity of 25 tons.

The boiler house adjoins this and is 52x76 feet. Here are five 100 horse power tubular boilers, each 66 inches by 18 feet. They were furnished by the Erie City Iron Works, of Erie, Pa.

The next room in rotation is the incinerator room. This is where the peculiar system of the Hickman process takes place. An incinerator, or rotary furnace, is used for burning the liquor. There are also three liquor tanks, 11 feet in diameter by 11 feet deep, through which the fluid passes. The alkali room is next, 52x84 feet, and two stores, with rock bottom and cement ceiling. This is used for liquor mixing and lime reclaiming. Here are six mixing tanks, each 14 feet in diameter and 8 feet deep. They were furnished by the Dobbie Foundry Co., of Niagara Falls, N. Y. The yaryan room, 50 x 72 feet, is equipped with four steam pumps made by the Stilwell-Bierce & Smith-Vaile Company, of Dayton, Ohio.

Before describing the machine room a word about the machine shop. Here is a perfectly appointed repair room two stories in height, 32 x 50 feet, equipped with lathes, drill press, cutters, planers and other necessary tools. It adjoins the machine room, which stretches out 225 feet by 56 feet, with a solid cement floor. The room is designed for two 96 inch machines, one of which is now being set up. It is from the Pusey & Jones Company's shops at Wilmington, Del., and has two cylinders and twenty-seven dryers. Some 50 feet of this room are allotted for a basement. Here two beating engines from the Globe Iron Works, of Dayton, Ohio, will be set up, as well as a quota of stuff chests, which are being made by Superintendent Campbell.

The store room continues on from the machine room, is 108 x 56 feet, one storey, with cement floor. Here is ample room for storing and shipping the finished product as it comes from the dryers ready for tying up.

Back of the machine room is the wash and bleach room, 65 x 156 feet, three stories. Here are two beating engines, two large sized blow tanks, 18 feet in diameter by 16 feet deep; ten draining tanks, 25 bleaching tanks and five washers. The engines, drain tanks and washers are from the Pusey & Jones Company, while the bleach tanks are being built by Superintendent Campbell and the blow tanks by the Dobbie Company.

The office and laboratory will complete the main buildings. The former will be 32x36 feet, located in the north-west corner, second story, and will be modernly appointed. The laboratory adjoins, where the chemical and electrical supplies will be kept and tests made.

Near the south-west corner of the main buildings is the straw, or flax, house, a brick structure two stories high, 48 x 54 feet. Here the raw product is received, and is cut and placed in proper form for starting on its way to be transformed into flax pulp. This building is equipped with two cutting machines made by the Winona Manufacturing Company, of Winona, Minn., with a capacity of 25 tons a day. The carriers take the flax, after it is cut the right size, to the digesters.

Back of the flax house, and near the river, is the pump house, a brick fireproof building, 24 x 30 feet in size. It is furnished with one fire pump made by the Lawrence Machine Company, of Lawrence, Mass., and two centrifugal 10-inch pumps, also made by the same company. A filter system will also be installed.

PURCHASES OF CANADIAN PULP.

CONCERNING the large orders reported to have been placed for Canadian wood pulp for this year's delivery, a correspondent writes to the Paper Trade Review, of London, Eng., as follows :

As the very tall yarn regarding the reported purchase of 60,000 tons of Canadian pulp by Messrs. A. Wertheim & Company is calculated to injure the Canadian pulp industry, I hasten to contradict the same.

No such purchase is possible at one time and for one year's delivery. Canada has never yet shipped 60,000 tons of mechanical wood pulp.

It is common knowledge that the Nova Scotian mills sold out by August last for this year's delivery, and the pulp did not go to the firm you mention, although I understand Wertheims took over in October last the contracts of one of the original buyers, for a total quantity of about 20,000 wet tons, which quantity included the product of the Newfoundland mill.

It is therefore absurd to suggest a purchase of a further 60,000 tons from Canada, especially as two productions are still open, and I assume the 20,000 to which I refer have grown in transmission.

The Canada Paper Company is putting a new steel digestor, 28 feet long and 7½ feet in diameter, in its sulphite mill at Windsor Mills, Que.

PULP NOTES.

Mr. Lorne McGibbon has been appointed manager of the Laurentide Pulp Company at Grand Mere, Que.

Mr. Chas. H. Vogel, of Thorold, Ont., is making water power surveys on the Ottawa river for pulp mill purposes.

It is reported that Chapin & McVittie, who own a pulp concession north of Mattawa, Ont., intend erecting a pulp mill there.

It is stated authoritatively that as soon as spring opens the Spanish River Pulp & Paper Company will push work rapidly on their projected pulp mill near Webbwood, Ont.

The imports of wood pulp by Great Britain in 1900 were 488,827 tons. Of this quantity 58 per cent. was supplied by Norway, 23 per cent. by Sweden, 11 per cent. by Canada, and 2 per cent. by the United States.

Price Bros. & Company, of Quebec, are said to have subscribed half of the capital necessary for the erection of a pulp mill on the River Du Sud at Montmagny, Que., and it is announced that work will commence this spring.

The Chaudiere Falls Pulp Company is seeking incorporation, capital $200,000, headquarters Quebec. The applicants include Henry Atkinson, lumber merchant, Etchemin, and Chas. King and H. M. Price, lumber merchants, Quebec.

A change will in future be made in the method of compiling the Board of Trade returns showing the pulp imports into England, the British Wood Pulp Association having induced the customs authorities to distinguish between the imports of chemical and mechanical and wet and dry pulp.

Work has begun on the projected site of the pulp and paper mills to be built at Brompton Falls, Que., by an American syndicate which recently purchased a water power from the British American Land Company. It is expected that $500,000 will be spent on the enterprize. Mr. Tobin, M. P. for Richmond and Wolfe, is interested in the company.

The Quebec Pulp & Paper Company, capital $350,000, has been organized, the object being to build mills at Indian Lorette. The initial step is to be a ground wood pulp mill of 30 tons capacity daily, then a sulphite mill of 75 tons and a paper mill of 50 tons. The formation of the company was looked after by R. Wilson-Smith, Meldrum & Company, of Montreal.

It is reported that in the province of Quebec there has been a sharp advance in the price of pulp wood, some loggers asking as high as $5 per cord on the south side of the St. Lawrence. Many American mills are said to be short of their supply of pulp wood. The International Paper Company, of Niagara Falls, is receiving nearly all of its supply by the carload from Michigan and Ontario.

The Chicoutimi Pulp Company, of Chicoutimi, Que., is preparing to erect another pulp mill near the present one, to have a capacity of 60 tons per day. It is to be a 12-grinder mill, and is expected to be ready for operation early in 1902. Mr. Pratt, the superintendent of the company, thinks that the government should dredge the Chicoutimi river from its mouth to the town of Chicoutimi, as at present shippers are compelled to go six miles down the river to load goods on vessels.

In an address before the Ottawa Board of Trade, Hon. Mr. Shimizu, Japanese consul at Vancouver, spoke as follows regarding the increased shipments of pulp to Japan: "Of course I am very glad to observe, as I said before, that the trade between Japan and Canada has already begun to grow. Take, for instance, wood pulp. Just a few years ago samples of this product were sent to Japan as an experiment, with the result that in 1898 less than 400,000 pounds were exported to Japan, while in the next year over 3,000,000 pounds were sent to my country, and I am told that from the pulp mills at Sault Ste. Marie alone 500 tons of these goods are now being sent to Japan monthly."

Satisfactory progress is being made towards the erection of pulp mills in the Lake of the Woods district. Mackenzie & Mann are preparing to build a mill at Fort Frances, while steps are also under way by another syndicate to build a mill on the American side. It is not unlikely that these two enterprises will be united, as a meeting of the promoters was held in the Queen's Hotel, Toronto, recently, when such a proposition was discussed. The Keewatin Power Company are reported to have decided to build large pulp mills at Rat Portage, somewhat further north and west than Fort Frances, on Rainy Lake. There is an excellent water power there. The directors of the Keewatin Power Company are: J. Fuller, Hamilton (president); William Gibson, ex-M.P., Beamsville; Alex. Fraser, Ottawa, and Alex. Maclaren, Buckingham, Que.

The revenue derived by the province of Ontario last year from pulp wood dues was about $13,000, compared with $4,828 in the year previous, the increase showing the development in this branch of forest product. The quantity in the two years was 65,000 cords and 30,000 cords respectively. Tee yield of pulpwood on the areas now being cut is probably ten cords to the acre, which means that about 6,500 acres were cut over last year, or about eleven square miles, which is a mere drop in the bucket in northern Ontario. North of the height of land surveyors have estimated that the spruce yield will be from 50 to 75 cords to the acre. Last year's cut of pulpwood yielded the government 20 cents per cord, but an order in council was passed a year ago providing for its increase to 40 cents, which went into effect April 30th, 1900, after last year's cut had ceased. The change provided that the 40-cent rate will apply on timber licensed lands where the rate had been 12½ cents; on lands that were under pulp agreements, at 20 cents, and on lands where permits were issued for small quantities at 25 cents. The new rate does not apply to the Sault Ste. Marie mill for three years yet, the price having been fixed at 20 cents for a certain term by special agreement.

CORRESPONDENCE SOLICITED

THE above view shows one of the many styles of setting and case to which our

CROCKER PATENT TURBINE

may be adapted. This plant was built for direct connection to Wood Pulp Grinders.

We invite correspondence from those contemplating the erection of Ground Wood Mills. Estimates submitted for complete equipments.

Let us have your address and we will send you a copy of our new 1900 Turbine Catalogue, also circulars of the Port Henry Grinder, etc.

THE JENCKES MACHINE CO.
36-40 Lansdowne Street - SHERBROOKE, QUE.

TRADE NOTES.

Mr. D. K. McLaren, belting manufacturer, of Montreal, has appointed Mr. John L. Richardson as manager of his Toronto office.

Mr. John M. Chisholm, manager in Winnipeg for the Rat Portage Lumber Company, has distributed to his patrons suitable souvenirs in the shape of desk rules.

Messrs. W. A. Fleming & Co., 771 Craig street, Montreal, have secured the contract from the Sault Ste. Marie Pulp & Paper Co., Sault Ste. Marie, Ont., for fitting up their sulphite mill with "Camel" brand hair belting and their heavy Empire brand rubber belting, also an order from the Canadian Electro Chemical Company, Sault Ste. Marie, Ont., for fire hose, hand hose carts, branch pipes, shut-offs, etc. They also fitted up their works throughout with the "Camel" brand hair belting, for which they are sole agents in Canada.

The Syracuse Smelting Works Company, of Montreal, advises us that they have recently secured large orders for babbitt metal for immediate and future shipment, and that they have found it necessary to increase their staff of employees. Their Mr. H. Sapery, manager of the Montreal branch, left early in February for a trip to California, and when returning expects to visit the principal points in British Columbia and Manitoba, where they now have an extensive trade. They report that the Syracuse babbitt metal is giving excellent results.

—Messrs. W. A. Fleming & Co., 771 Craig street, Montreal, have this year added to their extensive line of beltings a full stock in all weights of Balata belting of the best grade. This, with their large stock of the celebrated "Camel" brand hair belting (for which they are sole agents in Canada) and rubber, stitched cotton and leather, and solid cotton belting, make them probably the best equipped firm in the Dominion as a general mill supply house. The "Camel" brand hair belting is justly recognized as one of the best saw, pulp and paper mill belts. The manufacturers claim it to be more durable and freer from stretch than anything else used for belting, and that it posseses the great advantage of not being affected by dampness, heat or steam. W. A. Fleming & Company also carry a stock of wood split pulleys and a complete line of firehose and fittings for the mill.

Messrs. G. & J. Esplin, box manufacturers, Montreal, have recently purchased a 30 inch main drive, "Camel" brand hair belt from Messrs. W. A. Fleming & Co., Montreal, sole agents in Canada for Messrs. R. Reddaway & Co., Manchester, Eng. At the Dominion Bridge Works, Lachine, P.Q., the "Camel" brand hair belting is in general use throughout the several shops, driving all kinds of machinery. On lathes and machinery where the tight and loose or reversible pulleys are used, the D. & A. ball bearing shifter is put on. Their superintendent reports that he gets excellent results and wear out of the "Camel" brand, and a uniform and steady power.

The McFarlane, Neill Mfg. Company, Limited, of St. Marys, N. B., has had wonderful success since they opened up last summer and took over the business formerly run by the late Walter McFarlane. Large additions have been made to the plant, which formerly was an excellent one, and much new machinery has been added. Between 400 and 500 peavies alone are turned out each day. One recent shipment was of 1250 sent to Newfoundland. The concern also manufactures hames and boot caulks. Mr. Neill is one of the best known hardware men in the maritime provinces, and has had a thorough connection with the trade for many years.

Mr. John Palmer has recently enlarged his factory in Fredericton, N. B., and has now nearly doubled his capacity for the production ef larrigans, shoe packs, moccasins, sporting boots, etc. Mr. Palmer has for years been recognized as one of the foremost manufacturers in Canada of these lines of goods, and his output is the largest in the Dominion. A new building has been erected as large as the old one, and new machinery put in. His son, Mr. C. K. Palmer, who has been well known as a traveller for the Hartt Boot & Shoe Co., Limited, of Fredericton, N. B., has left that concern and is now assisting Mr. Palmer in the factory, in charge of the shipping and manufacturing departments. The Moosehead brand of goods is now widely known among lumbermen and woodsmen everywhere in Canada. In the firm's advertisement, which appears below, are illustrations of some of Mr. Palmer's lines. Besides those of which cuts are given some others are very popular. Lumbermen, foremen, scouters, sportsmen, etc., know how to appreciate the sporting boot made by this firm (No. 38). It has a long leg, high bellows tongue, Klonkyke eyelets, and is waterproof. It is well gotten up, and has a good appearance. No. 35 is a black long legged larrigan with a strap across the ankle. No. 39 is a long brown Skowhegan larrigan having sole leather heel and lap. No. 29 is an oil tanned, black, waterproof, bellows tongued shoe pack. An illustration is given of No. 45, which is a special line this season, and is making great headway. It is a thoroughly waterproof, flexible shoe that won't rip.

Charles D. Dickenson, of Charles Dickenson & Co., Woodstock, N. B., was in Toronto a few days ago, on his return from Ottawa and points west. The above firm is extending their upper province trade greatly. Their larrigans and shoe packs are receiving unusual attention from dealers owing to the fine workmanship, durability and finish. The "Henderson Non-rip Patent Larrigan" is a success, and wearers report to dealers all over the country that they are especially water-tight and that the staying qualities of the seams are excellent. The vamp overlaps the quarter, and stubs do not tear the flaps, as in some other makes, it is claimed. Mr. Dickenson claims that his larrigans can be guaranteed to wear out without ripping. He has had a life long experience in the leather trade, and his leathers should be reliable. Owing to the demand for his output of footwear he has recently lessened his output of upper leather, and will attend in future almost entirely to footwear manufacture. Last season he was unable to fill his orders in full and had to pass some very large ones. He looks for material increase this season. A new feature of his manufacture is a lumberman's driving shoe made out of larrigan stock, oil tanned, and presenting a neat appearance. Mr. Dickenson has received a number of orders from shoe manufacturers for this class of leather to put in next season's stock.

PERSONAL.

Mr. F. C. Todd, landscape architect, of Montreal, has become a life member of the Canadian Forestry Association.

A recent issue of the New York Lumber Trades Journal contains a portrait and sketch of Mr. A. H. Campbell, the New York representative of the Robinson-Edwards Lumber Company, of Burlington, Vermont. This company was incoporated in 1897, with Mr. D. W. Robinson as president, Mr. W. C. Edwards, M.P., of Ottawa, vice-president, and Mr. C. L. Smith secretary and treasurer. The company was formed to handle in the United States the lumber manufactured by Messrs. W. C. Edwards & Co. for that market. Mr. Campbell is but 26 years of age. His first connection with the lumber business was with W. C. Edwards & Company at Rockland, Ont., and afterwards in their retail yards at Ottawa.

The CANADA LUMBERMAN recently had the pleasure of a call from Mr. W. M. Nones, of the firm of J. A. Nones & Company, merchants and importers, London, England. Mr. Nones visited the United States and Canada, his mission being to arrange for shipments of sash and doors and moulding stock. He states that there is a large market in Great Britain for this class of material. In his opinion Canadian lumber manufacturers having a wood-working plant might find it very profitable to put in a few stickers to cut moulding stock, as by this means considerable refuse material could be utilized. Mr. Nones expected to remain on this side until the early part of April.

BAND VS. CIRCULAR.

Practical lumber manufacturers are coming to the conclusion that there is something of a "fad" element in the popularity of the band mill. The efficiency of the tool is admitted, and its advantages over the circular for certain classes of work, but it is coming to be believed that in many cases the band has been installed where a circular would have been better.

There are two things which limit the economic use of the band; namely, size and value of timber. Small logs can be cut more cheaply by the rotary saw than by the band, and in most cheap timber, unless it be too large in size, the circular is the more economical. Just where the dividing line is is a matter for discussion and experience Some say that a stumpage value of $2.00 a thousand marks the dividing line. If it is worth no more than that sum it should be cut with a circular; if above that, with a band. Some would use the circular on logs under, say, 15 inches in diameter; others to 20 or 24 inches, while of course some claim that the band is the machine for any size and any quality of logs. But the vast majority of opinion is that there is a dividing line in both quality and size.

Even granting that the band mill will make a cut as fast under any circumstance as a circular, which is denied by most users, the quality of pre-eminence in speed coming with the larger logs, it is a more sensitive machine, requires a higher degree of talent to keep it in order, and consequently involves higher wages. Where a circular saw filer might be hired for $3 a day a band saw filer would ask $5. Further, this extra sensitiveness of the band requires that the entire plant should be in better shape to do a given quality of work than if a circular were used. Unless a mill can be kept in perfect condition as to solidity of the foundation for the saw, alignment of track and perfect condition of the saw, the circular will do absolutely the best work. Everyone familiar with band sawed lumber knows that a good deal of the product coming from second-grade mills is unevenly sawed, of irregular thickness and often "lumpy." The tendency of a circular is to keep itself in line and even hold a log to the proper cutting line, whereas the band is easily thrown out of line by a shaky track or even by log imperfections.

The band saw mill is a distinct and notable advance in lumber manufacturing appliances and methods, but it should be confined to its proper place, and what that place is may well be carefully studied by mill men.—American Lumberman.

This Saw Stands Without a Rival

AND IS THE

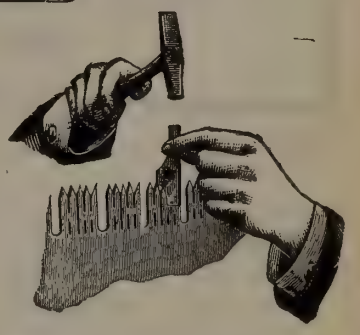
FASTEST CUTTING SAW IN THE WORLD!

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

Maple Leaf Saw Set

MANUFACTURED BY

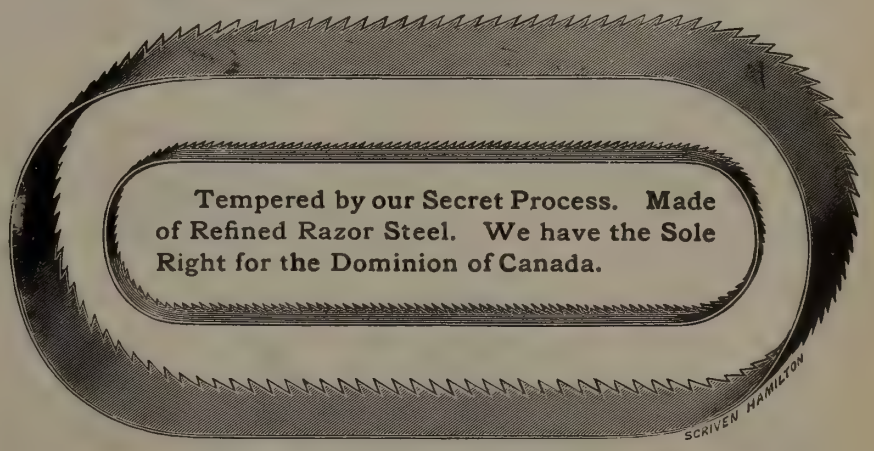
SHURLY & DIETRICH, Glt, Ont.



Directions.—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake. Be sure and not strike too hard a blow, and it will set the hardest saw. **On receipt of 40 cents we will send one by mail.**

We are the only manufacturers in the world who export Saws in large quantities to the United States.



Tempered by our Secret Process. Made of Refined Razor Steel. We have the Sole Right for the Dominion of Canada.
SCRIVEN HAMILTON

We Manufacture

HIGH GRADE BAND SAWS

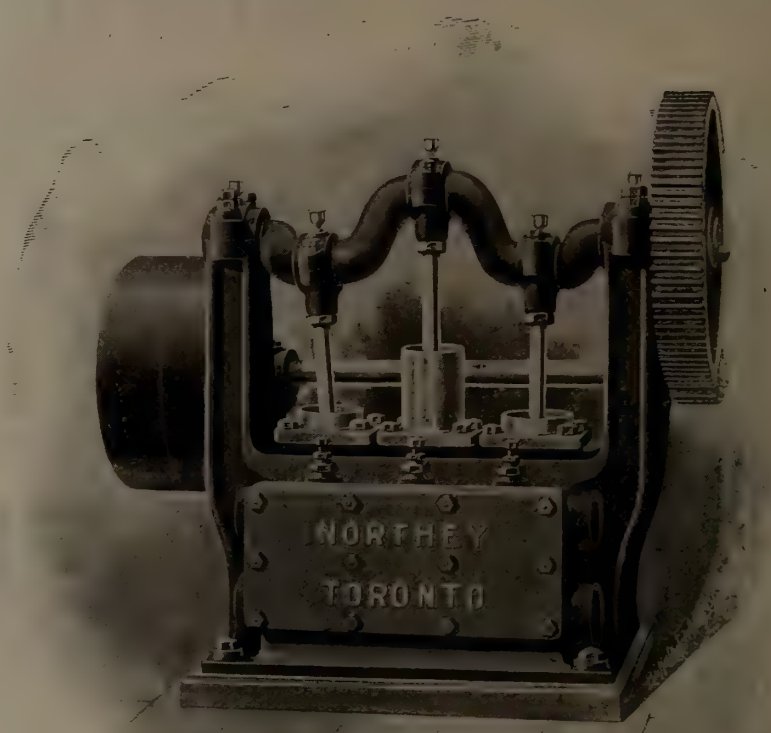
of All Widths and Lengths.

These Saws are made of Refined Swedish Steel imported direct, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

Northey Triplex Power Pump

FOR BOILER FEEDING AND GENERAL PRESSURE PURPOSES

In the Northey Triplex Power Pump we offer a machine put together with the skill brought by years of experience in pump building, and with full provision made for the varied demands likely to be made upon a pump of this character. A feature of value is that the three cranks are placed 120 degrees apart, thus giving a practically constant flow of water—minimizing strain on pump and economizing power. The pump can be readily repacked and taken up, and all details are carefully worked out. It can be conveniently operated by electricity, by water power, or by belt from engine. Different styles and sizes made to suit all duties.



WE ARE MANUFACTURERS OF OVER FIVE HUNDRED DIFFERENT STYLES AND VARIETIES OF STEAM AND POWER PUMPS FOR STATIONARY AND MARINE PURPOSES. WE INVITE ENQUIRIES FROM ENGINEERS, MINE SUPERINTENDENTS AND OTHERS FOR THEIR REQUIREMENTS IN OUR LINE. CATALOGUES AND SPECIFICATIONS FURNISHED UPON REQUEST.

We are also manufacturers of the Northey Gas and Gasoline Engine which has proved to be the handiest and most convenient power for small or intermittent power users in the market. Suitable for machine shops, pumping and electric light plants, etc. Write for illustrated descriptive booklet.

SOME SAW-MILLING ESTABLISHMENTS OF WIARTON.

EARLY in the sixties Mr. Thomas Gilpin, a contractor, in company with Dr. Williams, established the first saw mill in the town of Wiarton, operating the same upon the site near where Kastner's mill now stands. Wiarton was then but a small village, while to-day it is a prosperous town with numerous important industrial establishments situated within its limits. Owing to excellent shipping facilities a number of saw mills have been established there, including those of Messrs. Robert Watt, J. P. Newman, Siemon & Bros. Manufacturing Company, C. H. Witthun & Company, Jones Bros., G. Kastner, W. G. Simmie, and others. Illustrations and a few particulars of some of these mills and their owners are given below:

SIEMON & BROS. MANUFACTURING COMPANY.

In the fall of 1899 the above firm purchased the large saw mill previously operated by Mr. William Young, and are operating it to its full capacity. A large proportion of the product of the mill is used in the works of the Siemon Furniture Company, in which the members of the firm are interested, although large shipments are made to the United States and to local points. The mill is modern in its equipment and has a capacity of 4,000,000 feet annually.

In connection with their table factory they have a large dry kiln, with a capacity of 72,000 feet of lumber. Tramways run from the lumber yard at the saw mill to the furniture factory. The output of the furniture factory exceeds in value $175,000 per year. Over one hundred hands are employed, and $60,000 is annually expended locally for raw material in logs and timber. Large quantities of goods are shipped to foreign countries. Last year Mr. J. C. Siemon visited Europe and succeeded in forming a connection which is greatly increasing their trade.

SIEMON & BROS. MFG. CO'S SAW MILL AT WIARTON, ONT.

C. H. WITTHUN & COMPANY.

The above firm operates the Spirit Rock mill, situated just below the famous Spirit Rock. Mr. C. H. Witthun, who is the head of the firm, removed to Wiarton in 1899 from Hepworth, where he operated a large saw mill, besides one at Shallow Lake. The new mill erected in Wiarton is of a modern pattern and equipped with modern machinery, in which convenience and economy are combined in the conversion of logs into lumber. The mill has a capacity of over 20,000 feet per day, and is kept constantly running during the cutting season. A railway switch runs through the piling yard, giving splendid facilities for loading, and the mill being erected on the water with convenient dockage, vessel loading is also very conveniently handled, besides giving ample facilities for rafts.

Mr. Witthun has been a long time in the lumber trade and is one of the most extensive dealers in hardwood lumber in Western Ontario, having been largely engaged in the business in Hepworth and Shallow Lake. The products of the mill are marketed in Canada and the United States. The firm owns extensive timber limits, from which they can secure all the timber necessary to keep the mill running for a number of years yet. Added to this, they buy largely from the settlers, and the amount of money they distribute in this way during the winter amounts to a considerable sum. Their mill is now equipped for cutting pine, a gang resaw having been put in, and the firm would be willing to contract for the cutting of several million feet. On account of the location of their mill the rates of insurance are low. As a citizen Mr. Witthun is one of the most enterprising, ever ready to give his aid to any project which is calculated to advance the business interests of the town. Previous to going to Wiarton he was Reeve of the Township of Keppel for a couple of terms.

JOHN P. NEWMAN.

Prominent among the successful mill owners and business men of Wiarton is Mr. John P. Newman, whose extensive lumber operations have given him a wide acquaintance all over the country. From the Wiarton Canadian Souvenier it is learned that Mr. Newman went to Wiarton from Listowel in 1890, and formed a partnership with Mr. A. G. Seaman in the saw mill and timber business. A small saw mill on Griffith Island was purchased by the firm from Mr. John Kidd, moved to Wiarton, enlarged and improved, and a successful and prosperous business was established. The partnership was continued until December, 1896, when Mr. Seaman retired and Mr. Newman became sole proprietor. The present mill is equipped with all the latest improved and most modern machinery, with a capacity of 20,000 feet of hardwood per day. The annual output is about 3,500,000 feet, principally hardwood and cedar, besides from 1,500,000 to 2,000,000 million shingles, large quantities of square timber, ties, etc. This is distributed all over the country, the principal markets being Canada and the United States, with some shipments to Great Britain.

Mr. Newman owns large timber limits on the Bruce Peninsula, also timber on Lonely Island in Georgian Bay, where a large number of men are employed during the winter. In 1897, in company with Mr. Wm. Young and Capt. F. Wood, he purchased the tug Ann Long, for towing the rafts from the different dumps to the mill. In 1898 the tug was rebuilt and renamed the Gladstone, and is now a first-class vessel of her class. She is 78 feet keel, 85 feet over all, 17 feet beam and 9 feet draught. She is equipped with the latest improved compound engines, 12½ and 24 x 16 inch stroke, suitably fitted out for the comfort of the crew and raftsmen. From the opening of navigation until the close the tug is busy rafting.

Mr. Newman takes an active interest in public matters. He served several years in the town council, and while there looked carefully after the interests of the ratepayers.

THE NATIONAL HARDWOOD LUMBER ASSOCIATION.

THE Inspection Bureau of the National Hardwood Lumber Association have issued a pamplet containing the rules and regulations of that Bureau, with the object of informing the lumber trade as to the methods adopted by the bureau, and ultimately to induce the hardwood trade to avail itself of the protection it affords. The association have printed 20,000 copies of the pamphlet.

DRYING THICK MAPLE.

A gentleman who, because of great experience, is considered a good authority on drying all kinds of hardwoods, gives to the Wood-Worker his views regarding the drying of 2-inch hard maple. He says :

"In regard to kiln drying 2-inch hard maple, I will try and give as clearly as possible the method used by myself for several years, with good success. In the first place, much depends on the condition of the lumber to be dried in regards to its being green or partly dry, as each condition requires different treatment. Then also much depends upon the type of dry-kiln—whether a blast or dead-heat drier. Not knowing these conditions I cannot state as positively what is best, but will endeavor to give enough to enable him to make a selection.

"In the first place, if the lumber is green, it would be greatly benefited by a live steam bath in a tight room, of from three to five hours. This loosens all the sap and leaves the pores open for the water and sap to flow out from the center, but after this steam bath a fan should be turned on to circulate the air, with a moderate heat at first, say 115 degrees. This will prevent staining the lumber, and if done well you will be surprised to see how soft and bright your lumber comes out—equal to any air-dried in regard to softness and much brighter in color, yet dry as a bone and free from honeycomb and checks. The fan should be kept going until the air gets fairly dry again, then repeat the steaming, only on a small scale, or just enough to moisten the outside of the lumber and keep the pores open until the center is dry, for that is what we are after; for if the center of the board is dry you can dry the outside without damage.

"If the steam baths are used properly 2-inch maple could be dried in from nine to twelve days, thoroughly, but that would require strict attention to do it well. You would get best results by not using over 130 degrees, and from 115 degrees to that for a few days, then increase at the last as the lumber gets dry enough to stand it, when it may be raised to 160 degrees. The steaming must be regulated by judgment and examination of the lumber, but it would be safe to use a light steam bath once a day for about half an hour for three or four days. The first bath must be to thoroughly steam the lumber ; the others merely to keep the outside from drying too fast—only to moisten the air. If a hot blast kiln, where a thorough steaming is not practicable, you can have a steam jet come up in front of each blast pipe so as to moisten the air as it goes through the lumber. This tends to sweat the lumber and draw out the sap, although not as thoroughly or quickly as a thorough steaming.

"I have dried thousands of feet of 4-inch maple this way, in twenty days, free from checks, and bright as a dollar. The old tight-box kiln with heat pipes is not to be considered, because that only bakes lumber as hard as a brick and checks it if at all green, unless dried very slowly. One of the best kilns for green, heavy stock is where you can run a track through it long enough to hold, say eight or ten cars from 4 to 6 feet wide so as to pile the lumber with edge to the blast. Load your cars outside and start at extreme end from entrance of blast, then let cars down each day until the kiln is full, when by proper management you can take out a car each day and put one in ; thus the green stock is not subjected to the heat until it is laden with moisture and the degree of heat reduced. Much care should be taken to pile the stock to insure free ventilation.

"There is one thing I fear is a drawback to the best results in drying lumber, and that is most people think any man about the place can operate a kiln. But that is a mistake. If you want best results get a man of good judgment who understands something of the nature of wood and the effect of heat on the fibers. Another thing that is very injurious, especially to hardwood, is the cooling down of the kilns. If drying green lumber, the heat should be kept on it constantly until dry. Lumber nearly dry will stand it, and some soft woods will stand it, but not green hardwoods. By careful watching and care the time might be reduced to eight days, but that can be determined only by practice.

"I hope this may prove satisfactory to your correspondent. If it is not clear I should be pleased to explain more in detail if he will give conditions and the results he wishes to attain, since what is dry enough for one is not always right for another."

C. H. WITTHUN & CO.'S SAW MILL AT WIARTON, ONT.

There is reason to believe that a large pulp mill will be established in British Columbia in the near future by Toronto capitalists. The carrying out of the enterprise is said to be dependent upon a satisfactory arrangement with the Government regarding the acquisition of the land, and it is thought that the Government will meet the wishes of the promoters. The proposed site is on the main-land opposite Queen Charlotte Sound, and the initial output will be 100 tons per day. One of the chief promoters is Mr. J. J. Palmer, president of the Toronto Type Foundry Company, who is represented in Vancouver by Mr. S. F. McKenzie.

QUESTIONS FOR BAND FILERS.

THE questions submitted have been touched upon from time to time, either directly or indirectly, but there are many bright, well informed filers that can add their quota to the sum of general information of these matters if they but will do it, and it is hoped these questions may serve to draw out the practical experience of quite a number :

1. How best to cool and dress a braze ; that is, whether to gauge of saw or thinner, and why?

2. How to locate and remove a line twist ?

3. Under what conditons are speeds of 8,000, 9,000, 10,000 or 11,000 feet per minute advisable for log bands ?

4. What are reasonable limits for hook and pitch of back for hardwoods ; and what for soft woods ?

5. How near to each head of band-saw is it expedient to tension ?

6. Do you buy emery wheels to suit the speeds of your sharpeners, or adapt the speeds of sharpeners to the grade of emery wheels, or pay no attention to the matter at all ?

7. How do you shape the face and edge of your emery wheels, and why ?

8. In what parts of your saw fitting does it pay you best to "work close ?"

9. What has been your experience as to the comparative merits of file side-dresser and swage shaper ?

10. To what extent do you depend upon use of cross-line or tilt ?

11. How much tension and back do you run in your saws, say for 6, 8, 10, 12 and 14-inch widths ?

12. What devices do you employ for cleaning the wheels ?

13. What defects do you observe in saws fresh from the makers ?

14. When you increase or diminish the hook or depth of spacing of teeth or speed or saws, why do you do it ?

15. When does a band saw become unprofitable to run ; that is, what is its limit of life ?

16. What do you consider the best materials for guide pins ?

17. When does a band resaw outclass a circular resaw ?—Millman, in Wood-Worker.

THE GLASGOW EXHIBITION.

The following information regarding exhibits at the forthcoming Glasgow exhibition will be of interest to intending exhibitors : There will be no charge for space to exhibitors. Accepted exhibits, packed in strong cases, must be delivered at the exhibitor's expense at the seaboard, not later than March 15th, to be shipped to Glasgow by the Canadian commission, free of charge. No exhibitor will be permitted to transfer his allotment or to allow any other than his own duly accepted exhibits to be placed thereon. All goods must be exhibited in the name of the person or firm who signed the form of application. Space not occupied thirty days previous to the opening of the exhibition will be forfeited, and alloted at the discretion of the commission. No stand, including signboard, may exceed twelve feet in height, without special permission. The commission will bear cost of transportation of all exhibits from the ports of Montreal, Quebec, Halifax, St. John and Portland, direct to Glasgow by steamer.

CANADIAN FORESTRY ASSOCIATION

Second Annual Meeting at Ottawa.—A Number of Interesting Papers Giving Practical Advice Regarding Tree Planting and Growing.

The second annual meeting of the Canadian Forestry Association opened in the Railway Committee room of the House of Commons at Ottawa at 10 a. m. on March 7th. In the absence of the president, Sir Henri Joly de Lotbiniere, Lieutenant Governor of British Columbia, the chair was occupied by the vice-president, Mr. William Little. Amongst those present were the following: William Little, of Westmount, vice-president; E. Stewart, Dominion Superintendent of Forestry, Ottawa, secretary; R. H. Campbell, Ottawa, treasurer; Dr. William Saunders, Superintendent of Experimental Farms, Ottawa; Dr. James Fletcher, Dominion Entomologist, Ottawa; Dr. C. A Schenck, principal School of Forestry, Biltmore, N. C.; Thomas Southworth, Ontario Superintendent of Forestry, Toronto; Prof. John Macoun, Geological Survey, Ottawa; George Johnson, Dominion Statistician, Ottawa; John Bertram, Collins Inlet Lumber Company, Toronto; John Waldie, Victoria Harbor Lumber Company, Toronto; D. C. Cameron, Rat Portage Lumber Company, Rat Portage; J. B. McWilliams, Crown Timber Agent, Peterborough; William Pearce, Calgary, N. W. T.; Norman M. Ross, Biltmore, N. C.; W. C. Edwards, M. P., Ottawa; Aulay Morrison, M. P., New Westminster, B.C.; Hon. J. B. Snowball, Chatham, N. B.; Dr. Christie, M. P. for Argenteuil, Que.; Hon. J. V. Ellis, St. John, N. B.; Hon. William Kerr, Cobourg; Hon T. A. Bernier, St. Boniface, Man.; J. J. Bell, Toronto; W. T. Macoun, Ottawa; T. S. Young, Canada Lumberman, Toronto; Prof. W. L. Goodwin, Kingston; J. C. Langelier, Superintendent of Forest Rangers, Quebec; Hiram Robinson, Hawkesbury Lumber Company, Ottawa; A. C. Campbell, Ottawa; J. A. Gemmill, Ottawa; Otto Klotz, Ottawa; W. N. Hutt, Southend, Ont; Leighton McCarthy, M. P.; Hon. Mr. Emmerson, M. P.

Letters of regret were read from Hon. G. W. Allen, of Toronto, and Dr. A. H. MacKay, vice-president for Nova Scotia.

The minutes of last meeting being read and confirmed, the secretary submitted the report of the Board of Directors, which reviewed the work of the association for the first year of its existence. It showed the membership to be 244, five being life members. The report referred to the meetings which had been held in Manitoba, the Nort-West, and British Columbia, in which provinces forestry associations have been formed. During the year two timber reserves were set apart. In Manitoba all the lands north of township 38 and west of Lake Winnipegosis have been reserved from settlement, as most of this tract is already well timbered and known to be largely unfitted for settlement. The other reserve was set apart by the Ontario Government, and consists of about 1,000,000 acres surrounding Lake Temagami, which includes a large quantity of white pine and timber and covers the head waters of a number of streams flowing into Lake Nipissing and the Ottawa river. The great extension of the pulp industy and the demand created thereby for spruce timber, the report stated, especially rendered it advaisable that a special sturdy of this tree should also be made, so that we might know what our resources for this purpose are and when and how steps should be taken to ensure that the returns from this source of wealth should be retained at the highest possible permanent figure. The report in conclusion urged the extension of the fire ranging system and the holding during the current year of a number of public meetings in the large centres of population.

On motion of Mr. E. Stewart, seconded by Mr. J. M. Macoun, the report of the directors was adopted.

The treasurer submitted the financial report, which was referred to the auditors, Messrs. George Johnson and J.M. Macoun.

The chairman, Mr. Little, said that he sincerely regretted the unavoidable absence of the president, who had done much for the cause of forestry. He read a letter and telegram from him wishing the Association success. He also referred to the irreparable lose we had sustained in the death of our Queen, and instructed the Committee on Resolutions to prepare a suitable memorial.

Dr. Saunders then read a paper by Mr. J. R. Anderson, Deputy Minister of Agriculture for British Columbia, entitled "Forestry in British Columbia." It was a most complete review of the forest resources of that province, giving the location and adaptability of the various classes of timber. This paper, together with a synopsis of the interesting discussion which followed, will be printed in our may issue.

Reforestation of Dominion Lands

"Foresty on Doninion Lands" was the subject of a paper read by Mr. E. Stewart. Mr. Stewart showed that the Dominion Govemment was, contrary to the general impression, the owner of vast areas of timber lands. He referred to the methods employed in Ontario and Quebec to prevent forest fires, and to the Riding Mountain timber reserve in Manitoba, but paid particular attention to the question of tree planting on the plains, a matter which has been consideration by the Dominion forestry branch for some time with a view of working out a plan that would be practical for adoption on our western prairies. The European systems would not succeed in our North-West, where the climatic conditions are so dissimilar and where the government machinery is different. He stated that several attempts had been made to encourage tree planting on the plains by the United States Government. One of these was what is known as the Forest Tree Culture Claims, by which a certain amount of land was earned from the Government by the planting of a certain area in trees. The system has not been effective. In Canada the Government has experimental farms at Brandon and Indian Head, from which large quantities of tree seeds and young trees have been supplied to settlers, but it was well known that many of these never succeed, largely owing (1) to bad planting, (2), to their being planted in land not sufficiently prepared, and (3) to lack of cultivation and attention after planting by the settlers.

The Federal Government of the United States had at last adopted a system of co-operation with the settlers, and the main features of this system have been utilized in framing a system for the Dominion, but it was proposed to go further than they do, in that it is hoped to be able to furnish seeds and plant material.

The system as proposed by Mr. Stewart is as follows:

1. It is proposed that any owner wishing to avail himself of the co-operation of the Government in the planting and cultivation of a forest plantation, wind-break or shelter-belt, shall make application to the Forestry Branch at Ottawa.

2. On receipt of this, the local supervisor of tree planting for the district in which the property is situated is directed to visit and examine the lay of the land and its quality, any streams on it, the location of the buildings, etc., and in case he thinks trees can be successfully grown on it, he will show the position of the proposed plantation, the kind of trees to be grown, their distance apart, etc.

3. This sketch and any other detailed information he may consider necessary will be sent to the head office, where a working plan will be prepared drawn to scale and showing the general features of the farm as compiled from the notes and sketch made by the local supervisor, and also the position of the proposed plantation and other necessary information.

4. A copy of this plan along with the agreement will be sent to the owner. He will keep the copy of the plan for his guidance and return the agreement duly executed.

5. According to the terms of the agreement, the owner agrees to prepare the soil for the plantation and to plant and properly care for the same after planting according to the plan under the direction of the said supervisor or agent of the Department of the Interior.

6. The Department will as far as the means at its disposal permit, furnish seed and plant material for the purposes of planting the said plantation.

7. The Department proposes to render all services above specified wholly without charge.

8. The Department under the agreement reserves the right to enter and take from the plantation for use elsewhere any young seedlings that may be growing up and which should be removed in the proper management of the location, unless the owner wishes the same to extend his plantation. The same privilege is stipulated for with reference to cuttings and seed.

9. It is also provided that the Department shall have the right to publish and distribute the said plan and its results for the information of farmers and others whom it may concern.

The two prominent features of the proposed plan, Mr. Stewart pointed out, are (1) the furnishing of the seeds, cuttings and young trees by the government, and (2) government supervision in tree planting and cultivation by the settlers. As to supply the plant material will be a matter of some magnitude, it is proposed to allow the Department the unused product in any plantation for use elsewhere. The Department would be permitted to enter and take young seedlings which are not required by the owner to extend his own plantation. By this means it is believed that the difficulty in supplying the plant material will be met.

DISCUSSION.

A gentleman from the North-West said that he thought the plan proposed by Mr. Stewart would meet the needs of that district, and urged that it be adopted at once. Of course, difficulties would be met, settlers would not fall in line as readily as they might. He suggested that the plan of taking small trees and seeds from the farmers' plantations should be restricted to seven years.

Mr. Pearce read a letter from Mrs. Card, of Cardson, Southern Alberta, expressing her sympathy with the forestry movement. Speaking of Mr. Stewart's proposition, Mr. Pearce said that for immediate assistance the government might establish small nurseries throughout the country. There were many sections of irrigated country where, for a small consideration, the owners would plant trees. On his own property he had thousands of balsam poplar growing, from 3 to 5 feet high, which were planted in May, 1899. He pointed out that the disastrous floods which had occurred on the Saskatchewan river were due to the country being denuded of shrubs and timber, so that when rain came the water rushed down the grades very quickly.

Dr. Saunders also endorsed the proposal for tree-growing as submitted by Mr. Stewart.

The secretary then introduced to the meeting Dr. Schenck, of Biltmore, N.C., who is principal of the School of Forestry there and manager of the large forestry estate of the Vanderbilt family.

Dr. Schenck referred to the advantageous position which Canada occupies in respect to forestry as compared with the United States. European forestry methods, he said, were absolutely not applicable to this country. Where forests exist forestry was identical with the fire question. Two hundred years ago there were no forestry methods in Europe, only a little stock farming forestry. The practice of forestry would doubtless prove profitable. He believed that the governments should provide more funds for fire protection, as it was one of the best investments a government could make. He urged the government to establish nurseries to supply the small plants to farmers. If nurseries could not be established, the proposal of Mr. Stewart would perhaps meet the situation very well. The cost of growing plants in nurseries was small ; trees could be grown in nurseries at less cost than they could be taken out from where they were growing too thickly.

Mr. Stewart said that every means would be taken to supply the material to the farmers and others. When he was in the west he was surprised to see the interest that was taken in the subject by the people of Manitoba.

Dr. Saunders said that in 12 years they had distributed from the Experimental Farms eight tons of seeds and 1,500,000 seed trees, and they could not supply the demand. There were about 300 varieties of trees at the Brandon Experimental Farm.

Prof. Macoun said that the main principle of tree growing was to conserve the water by making small dams. It was only a myth that certain lands would not grow trees.

Mr. Stewart stated the intention of the Government to make a reserve of the Cypress Hills. He thought forest reserves should be set apart by Act of Parliament rather than an order-in-council, as the latter could be changed or expunged at any time.

A gentleman stated that he had transplanted some 30 small pines, about 5 feet high, from their natural bed, and of these sixteen were now growing. At the same time he planted 20 firs and pines 18 to 24 inches high, and only 6 were now living.

Dr. Schenck explained that small seedlings were more likely to die than larger trees. Besides, our commercial nurseries did not furnish good trees.

The meeting was then adjourned for lunch.

Timber Lands of New Brunswick.

Resuming at 2.30, a paper on "The Timber Lands of New Brunswick Owned by the Crown," by W. P. Flewelling, Deputy Surveyor General, was read.

Mr. Flewelling gave a description of the timber resources of the province, the conditions under which timber licenses are granted, and of the methods of lumbering. The Crown still owns 7,500,000 acres, the greater portion of which are timber lands. Timber licenses are now held on about 6,000,000 acres of this land. Formerly timber licenses were granted for one year only. Later a system of three year licenses was adopted, and in 1893 a change was made to 25 years. The longer lease has led to the cutting of timber with greater care. The provisions of the license state that no tree shall be cut which will not make a log ten inches at the top, eighteen feet up. Owing to the great demand for pulp wood, many private owners allowed the cutting of spruce down to four and five inches in diameter.

The growth of spruce in most parts of New Brunswick is rapid. One of the largest operators stated, from personal observation, that a spruce tree would grow from the bud large enough to make a merchantable log in thirty years. The annual cut of spruce and pine logs from Crown lands is from eighty to one hundred superficial feet. Many large holders of licenses cut their limits very judiciously. Lands will be laid off in strips of 1¼ or 1½ miles wide, and from 5 to 10 miles long ; one strip will be cut over one year, taking all the merchantable logs, the next year the adjoining strip will be operated on, and so on, for about seven years, when the parties can be sent back to the strip first cut over and find that the growth has been so rapid that another good operation may be had.

Mr. Flewelling pointed out that the province should protect its spruce timber both from the indiscriminate use of the woodman's axe and from destruction by fire.

Mr. Bertram was then called upon to read his paper on "The White Pine and its Economic Management." He said that he was glad to find that a scientific forester such as Dr. Shenck, after experimenting in Germany and elsewhere, had reached the same conclusions as he had. The paper in full is given below.

White Pine and its Economic Management.

By John Bertram.

The observations in this paper are confined to the growth and reproduction of white and red pine in Ontario. The early settlers in this province, and it may be added, North America, were little concerned with the economic problems of forestry ; their main object was of necessity to clear away enough of the forest as would grow food for their families. So vast was the forest that an indiscriminate war was waged with axe and fire against all forest growth, and many localities were stripped bare where the trees should have been preserved and the forest continued.

Southern Ontario is second to no country in the world for richness of soil and salubrity of climate. It was covered by a thick stand of timber, and if the first settlers had been gifted with sufficient foresight they never would have cut down the timber in many corners and parts of their farms. There are very few localities in Ontario south of the Laurentian Range where it would have been more profitable to have retained the original forest ; a very large percentage of the soil is better employed growing roots, grass and cereals, but when this is admitted it is also true that there are many localities, such as hill-tops and sides, ridges, gullies, the banks and sources of streams, gravel banks, sand hills, and rough broken land generally, that would give a much better return by growing timber rather than grain, and the sooner this is understood and appreciated the better for the owners of the land. It is not within the compass of this paper to speak of the great benefits accruing to any country where a fair proportion of the area is kept under forest management; that they are great is now universally conceded.

So far as white and red pine are concerned the southern part of Ontario need not be considered, except that they would be a desirable tree in reforesting the poorer soils. There was a considerable quantity of excellent pine which grew as a rule amongst the hardwood, and sufficient of it is left as second growth to reseed any locality considered desirable.

It is now with a different region entirely that the future of pine timber in Ontario is bound up. There is a vast area, nearly a thousand miles from east to west running through the province, and which may be considered the true home of the white pine, not that it reaches its best growth, but that it is economically the most valuable ; this part of the province commences a short distance north-west of Ottawa on the north, not far from Kingston on the south, and away north westward around Georgian Bay and Lake Superior to Rat Portage, overlapping the height of land between the St. Lawrence and Hudson Bay waters. Large bodies of pine grew in this district. Most of the original pine forest has already been cut down, and sad to relate, fire has devastated a considerable portion of it and burned untold value in young trees. There is little or no pine in the forest which still stands north and north-east of Lake Superior. Spruce of moderate size is the prevailing tree. There is no climatic reason why pine should not again grow in this essentially rocky country, as there are detached bodies of pine standing north of the watershed in the region between the 48th and 49th parallels. The question which presents itself with reference to this region, from a practical and economical standpoint, is what policy should be pursued to obtain the best results with the least expenditure ; it is by no means an easy one, and is almost as varied as the aspect of forests in different localities; each type would require a close examination as it appears before the lumbermen or settler commences operations.

It is to be assumed that the lumberman under government supervision is desirous not only of marketing the present crop, but also of perpetuating the growth of the most valuable species. So looking at the whole matter in the light of experience, and remembering that operators in Canada are debarred from the expensive methods in vogue in thickly inhabited countries, where every tree-top branch and even twig has value, the following views for forest management are offered for your consideration :

1st. A very common variety of forest to be found particularly in parts of Algoma is where white pine was the predominant wood, but well mixed with other kinds. A fire occurred, it may be ten, twenty or thirty years previous to the condition now being considered ; it burned all the timber except some large pine trees left in groups or scattered here and there, as circumstances may have favored their escape. After the fire the usual seeding commences, poplar and white birch making their appearance first, by reason of their producing annually a large quantity of seed, which from its structure can be carried great distances, and as it grows quickly the ground is soon covered with young trees. The pine tree does not seed as a rule oftener than every third or fourth year, so that poplar and birch have time to make a good start. The poplar particularly grows very fast for a few years after making its appearance ; so when the seed from the old pine trees left standing begins to scatter, it finds an ideal condition for germination. This order of nature is exactly what is needed to produce a pine forest of commercial value. Pine seed will not germinate under a thick canopy, it needs sunlight and also the proximity of other young trees, causing it to shoot upwards, not grow into a bush as it would in the open. Growing up amongst the poplar and birch it gradually loses its under branches and by and by it overtops and dominates all the other trees, becoming the monarch of the forest. At a period then when the bush is thus covered with second growth and the old trees still standing, the course to be pursued presents no difficulties. Market the old timber when convenient and rigorously preserve the young timber against fire. When pine trees are in the earlier stages of growth a fire is most disastrous. They are easily killed, and the old trees having been cut down there would be no chance of reseeding, and so at this stage fire would be a real forest calamity.

2nd. A type of forest often presents itself composed

mainly of pine, but mixed with other conifers and a sprinkling of hardwood. The pine may be divided into two or three groups of different ages. It has killed out any deciduous trees that may have been mixed with it except in spots here and there where the pine did not seed. Hemlock, spruce and balsam being shade enduring trees, are often found struggling for life beneath the pine, but so long as pine is the dominant tree the others will make poor growth. If there are any large hemlocks or spruce they should be cut down and marketed, as they will only prevent pine from growing in their place. And now as to cutting the pine, no tree should be cut down unless it measure at least twelve inches diameter two feet from the ground. It is worth more standing, unless it may be that it is one of a group growing too close together, when the woodman's craft should be exercised in selecting which of the group should be cut down, relieving the others from the pressure of its presence. It would not be good forestry to cut down all the trees that would make a ten inch butt log; thinning may be an advantage, but at that stage where favorably situated they are too valuable for further growth. Care should be taken generally to preserve the canopy of the forest, while at the same time admitting enough sunlight for the growth of seedlings; they may be seen growing up in a young forest twenty or thirty feet high in the place where large old trees have been cut down, the requisite sunlight having been thus admitted. In this description of forest all the large old trees and most of the medium age can profitably be cut, leaving the younger timber room to grow, and this treatment by reason of accelerating the growth of the younger timber left would increase rather than retard the annual amount grown per acre. Instruction should be given to the woodsmen on no account to cut down a young pine except where making draw roads or clearing for skidways. The practice of using young pine to make crossways, bridges, or skidways, or even to put up buildings, should be strictly prohibited, just as the cutting down of all varieties not wanted should be encouraged. A little care would produce a valuable second crop for the owner, but it would all be thrown away unless fire was kept out, as it would be particularly destructive to this class of forest.

3rd. A forest composed mainly of hardwood mixed with large pine trees may now be considered; except yellow birch, the hardwood is seldom very valuable for lumber in our northern country, and often too far away from a railway to make cordwood. Pine amongst hardwood is very valuable for square timber and is much sought after; it has no chance for reproduction, as the seed disseminated will not grow under the shade of the hardwood, so when the pines are cut down the forest reverts to a hardwood of very little value. When the locality and soil are more fitted to grow pine, it is simply valuable space lost. To say that white pine seed will not germinate in a hardwood forest is not strictly true. The young trees may often be noticed very small, very sickly looking, and examinations of many specimens show that it will take twenty or thirty years or even forty years to grow one inch in diameter, the stunted trees finally dying for want of sunlight. A young pine tree refuses to live under the close canopy of a thick hardwood forest. Two things are necessary to reproduce pine in a forest of this kind; first of all, defective pine trees not valuable for lumber, and there is always a proportion of them, should be strictly preserved and guarded. All the trees in a high or exposed situation where the seed would have a chance of being carried long distances and over a wide area, should be left standing; and second, it will depend upon the locality and on the kind of hardwood, but as much of it should be cut down as possible, not making a clearing but taking all the large trees and leaving where possible the small ones as a shade for the young pines to grow up amongst. No arbitrary rule can be set, the owner will have full scope for all his acumen and individuality in producing the best results. Constant care and attention would be needed, and it should ever be remembered that silviculture is a slow process. Seed cannot be sown one year and reaped the next. This leads up to the question of ownership and fixity of tenure, which is a necessity for all operations extending over a long period of time.

4th. An entirely different method would have to be pursued in the case of a forest where the timber is all within say fifteen or twenty years of being the same age, the bulk of the trees being large but mixed with a good many of smaller diameter; twenty years is a short time in the life of a pine tree, and the different diameters arise through the large trees existing under more favorable circumstances. With more space and sunlight they have overshadowed the others, and although the small trees may be nearly the same age and height, they may not be more than one-half or one-third the diameter, and if the large trees were cut down, taking away the shelter from the long slender trees, they would inevitably blown down. The custom amongst lumbermen operating in a forest of this kind has been to cut down every tree, and the policy was sound enough; but if the object is to keep the bush in timber, then it would become necessary to cut only within certain defined areas, leaving enough standing as the original forest to reseed the cut over spaces. The selections would have to be made on good forestry principles; the timber would have to be left on hill tops and ridges so that the seed could distribute itself over a wide field; if the country were comparatively level then alternate blocks should be selected, not necessarily of any given space or size, but taking advantages of the inequalities of the ground and thickness and position of the standing timber. No exact formula can be indicated, as no two sections of the country are alike; each locality would have to be considered by itself and good judgment exercised in what to cut and what to leave, making sure only that enough is left to fairly cover the ground with seed.

5th. A large number of broad and prevalent types of forest could be cited, but enough has probably been said about what the course of procedure should be in the economic administration of forest lands. Another example only will be given, where hemlock, spruce and balsam are the prevailing trees, mixed it may be with some hardwood and moderate quantity of pine; to increase the quantity of valuable trees and eliminate the others is somewhat difficult; whatever distribution of pine seed there may be from time to time has little chance to come up where the ground is covered by other conifers. Their seed is all more or less shade enduring and will germinate and grow up where small pine would be smothered. The conclusion reached in considering this example is that the much dreaded fire would here be a friend and not an enemy; keeping in mind always that it is a growth of pine that is wanted, a careful survey should be made of this forest and the sections where pine exists, and under favorable conditions for the distribution of seed, should be marked off and a space cleared around them over which a fire could not go; cut all or a portion of the large pine, as the case may be, all the hemlock or spruce of market value, and set fire to the balance on a favorable opportunity.

Fire over a district, if not so fierce as to kill all the timber, is not much to be dreaded; it is the second and recurring fires, killing the young trees which may have sprouted and burning the soil, which is most to be dreaded. A fire that kills the useless trees and burns up the old needles and debris of the forest, leaving the large timber, is often a great benefit, as it brings the ground into a fit condition for receiving seed, and young trees will grow much faster than where overshadowed by an old forest; there is and can be no set formula in these matters, but much room for the exercise of observation and good judgment.

These questions of forest treatment have all to be considered from an economic standpoint, and as entirely within the scope of the owners of forest land in Ontario. No great expense need be incurred and no looking forward for a hundred years to obtain returns. A set of rules could easily be framed to govern all licenses, that while not depriving the licensees of anything of value, would at the same time preserve for the province a very valuable asset in young timber, dues for which would be collected in after years.

Much has been said and written on the annual growth of young trees, but as that matter was dealt with recently in the preliminary report of the Ontario Forest Commission, it need not be gone over now; one thing, however, may be said, that in a preserved pine forest a crop may be gathered every twenty years, more or less, without reducing the growth of the forest per annum.

And now to conclude with the most difficult question of all, what can be done with those areas of land burned over again and again; many of them can be seen from the windows of the railway car passing up the beautiful valley of the Ottawa river. They are evidence of the carelessness that should be amended as soon as possible; left alone they are a disgrace to the country. We are not the only sinners on the continent, the great State of Michigan is to-day earnestly engaged in an endeavor to reforest some three or four million acres of mostly abandoned lands within the State. When the regrowth of pine on such lands is spoken of, the idea is often met with unbounded jocularity, and the only question in the mind of the listener is what particular asylum the speaker should be sent to. In imagination a gang of men are seen putting in seedling trees much as young cabbage are planted; why it would cost millions upon millions, and the whole matter is dismissed with a laugh; nevertheless, the question is up for solution.

Covered again with forest these desolate areas would be of incalculable benefit to the country, and when the people fairly grasp its significance they will see that the government take proper measures to reclothe our bare hills and desolate valleys.

It is not here pretended that a full solution has been found; much thought and study will be needed, men of practical minds and experience will be found to undertake the work and a beginning can be made now.

It can be seen that on some of the burnt over districts a quantity of young pine has been left standing here and there; they should be regarded as a nucleus for future seed distribution, and keeping away fire, nature will do the rest.

There are localities, however, where fire after fire has swept over the country until not a single tree is left. This is the case often near settlements; carelessness and worse have produced the inevitable results, and it will be with much labor and difficulty that favorable conditions can again be attained. Individual planting over wide areas is in this country out of the question, and the only alternative that would seem to be left is to carefully select small patches, so situated as to effectually cover the country with seed, and by the inexpensive process of putting some seed in the ground raise clumps of trees of the desired species that would by and by reproduce themselves.

At the age of from 25 to 30 years more or less young pine would commence to bear cones and scatter seed; just how far seed will fly depends on many circumstances, but from observations made in burnt districts, which have been reseeded by solitary trees, and also noticing seed floating in the water, there seems little doubt but what the seed of conifers will distribute itself anywhere from the vicinity of the parent tree to a mile, or even more. Cones open in the fall when storms prevail, and no doubt the seed is detached very often during a violent wind, and from the vantage ground of the high tree-top and with the beautiful sail attached to the kernel, will fly great distances in stormy weather. Sufficient time being allowed, the reforesting of burnt over districts presents no economical difficulty. It is the ordinary process that takes place in a longer or shorter time in all forest countries. What is really needed by man's interference is to shorten the period of non-production and to assist nature to give us the varieties most wanted. The length of this paper leaves no time to speak of the benefits to be derived by having bleak barren wastes again covered with forest verdure. Neither can anything be said about the desirability of again causing white pine to grow in that very interesting region around the north shore of Lake Superior; that it can be done is proven by the evidences of pine growth north of the watershed. It would be an interesting pastime for some member of the association, with leisure on his hands, to devote some time and thought in demonstrating how pine can be made to take the place of the less valuable spruce in that most interesting region; and it is to be hoped that the zealous inspector of forestry will be able to induce someone to undertake the work.

DISCUSSION.

The discussion was opened by Schenck, who referred to the different forestry policies as adopted by Professors Pinchot, Fernow, and others. Scientific forestry, he said, was practical forestry, or a knowledge of forestry. He was quite in sympathy with the lumberman who cut over his limits as speedily as possible, as they were in great danger of being destroyed by fire. With them it was a business proposition. He advocated the selling of timber to lumbermen in large blocks, as in this way they would be more likely to protect the forest from fire.

Mr. W. N. Hutt said that in Southern Ontario it seemed that the climate was changing owing

THE Canada Lumberman

MONTHLY AND WEEKLY EDITIONS

PUBLISHED BY

The C. H. Mortimer Publishing Company of Toronto, Limited

CONFEDERATION LIFE BUILDING, TORONTO

BRANCH OFFICE:
IMPERIAL BUILDING, MONTREAL

The LUMBERMAN Weekly Edition is published every Wednesday, and the Monthly Edition on the 1st day of every month.

TERMS OF SUBSCRIPTION:

One Copy, Weekly and Monthly, One Year, in advance..... $1.00
One Copy, Weekly and Monthly, Six Months, in advance..... .50
Foreign Subscriptions, $2.00 a Year.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in anyway affecting it. Even when we may not be able to agree with the writers, we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

NOTICE TO SUBSCRIBERS.

Subscribers who may change their addresses on the 1st of May are requested to advise us of the fact, and send us promptly their new addresses, thus insuring correct delivery of their papers.

THE FORESTRY MEETING.

The recent forestry convention at Ottawa, of which a report appears in this issue, marks another step towards the adoption of practical methods for the preservation and perpetuation of our timber supply. The meeting was of a most successful character, and the proceedings of a nature to interest lumbermen and the public generally, as well as scientific foresters. The Association is to be congratulated upon the presence at the meeting of an experienced scientific German forester, in the person of Dr. Schenck, now principal of the School of Forestry at Biltmore, North Carolina, and superintendent of the forestry interests of the Vanderbilt Estate. Dr. Schenck proved beyond a doubt his able grasp of the forestry question, and his views were well received. He pointed out that scientific and practical forestry were identical, and showed himself to be the friend of the lumberman, and the object of forestry to be an ultimate advantage to the lumber industry.

The papers presented were of a most interesting character. Those having perhaps the most interest for our readers were by Mr. Bertram on the "Economic Management of White Pine," and by Mr. Langelier on "The Pulp Industry." In Mr. Bertram's opinion the various types of forests require special treatment in each case. He offered a system of management for five different kinds, namely: 1st, where white pine is the predominant wood, but well mixed with other kinds; 2nd, where pine is the chief timber, but mixed with conifers and a sprinkling of hardwood; 3rd, a forest mainly of hardwood, but mixed with large pine trees; 4th, a forest where the timber is all within fifteen or twenty years of being the same age; 5th, chiefly a hemlock, spruce and balsam forest, but mixed with some hardwood and a moderate quantity of pine.

Much interest centred in the discussion regarding the growth of timber. Mr. Bertram advocated that in a preserved pine forest a crop should be gathered every twenty years, without reducing the total growth of the forest per annum. It was stated that the growth of spruce in Ontario, according to experiments made extending from Ottawa to Rat Portage, was about one inch in diameter in five years. In the Maritime Provinces the growth seems to be more rapid, inasmuch as the method of lumbering employed by Mr. Snowball has been to cut over the ground every five or seven years, and this without reducing the annual cut. No explanation was offered as to the great difference in the rapidity of growth of spruce as between Ontario and the Maritime Provinces. As the quality of spruce found in Ontario resembles very closely that in the eastern provinces, the annual growth would be expected to be about the same.

The deduction made Mr. Langelier, based on the census' figures of 1891, was that at the present rate of cutting 840 years will be required to deplete our spruce forests. While these figures may be above the mark, they show that our spruce supply is practically inexhaustible, inasmuch as spruce is said to reproduce itself in from twenty to thirty years.

A DOMINION EXHIBITION.

THE Dominion Government is said to have appropriated large sums of money to cover the cost of Canadian exhibits at the Glasgow and Pan-American Exhibitions. A large sum was spent for this object at Paris last year. We are not disposed to question the wisdom of these expenditures. It is good business policy to advertise to the world the character and extent of our capabilities and productions, thereby inducing increase of our population and investment of capital. Why should not this be supplemented by the holding of a Dominion Exhibition in Canada and the effort to induce foreigners to come and actually see for themselves the kind of country we have and the greatness of its resources? We cannot hope to carry out an exhibition on the scale of those held at Chicago and Paris, nor should the attempt be made. Our natural development has reached a stage, however, which should warrant us in entering on an undertaking of this character on a properly proportioned scale. The Dominion Government last year refused to assist such a project, perhaps because of the large expenditure that was felt necessary to secure adequate representation at the great international Exhibitions at Paris, Glasgow and Buffalo. Next year when these shall have passed out of sight the subject of a Dominion Exhibition should receive practical consideration, and the Federal and Provincial Governments, which for many years have been spending money on Exhibitions got up by and largely for the benefit of other countries, should make a liberal appropriation towards a Canadian Exhibition to be held in Canada, which the mother country, our sister colonies and our neighbors across the line should be invited to visit and send exhibits to. We have the nucleus of such an Exhibition at Toronto, and in connection with the proposal to erect new buildings the larger project should be kept in mind. It is doubtful if the property owners of the city whose approval must be obtained will sanction the proposed large expenditure for new buildings until just cause of complaint with the management of the Exhibition shall be remedied. If the project of holding a Dominion Exhibition in the near future is to be proceeded with, it would be desirable to defer action with regard to new buildings in order that a comprehensive scheme adapted to the larger requirements might be formulated.

THE COMMERCIAL POSITION OF GREAT BRITAIN.

FOLLOWING closely upon the announcement that Russia has increased its tariff on United States goods, comes a despatch from London that as an outcome of the inroads of American manufacturers upon British trade there is being formed the National Federation of Master Associations and Trades Unions to educate the minds of employees and employers in respect to the expansion of British trade, to devise means to meet foreign competition, to send joint deputations of capital and labor abroad to enquire into the conditions of other countries, and to provide a federation where employers and employees may meet on the same plane. This movement is under the leadership of Mr. John Lockie, late conservative member for Devonport, and is said to have the approval of the present British government.

The United States have not only become a strong competitor for the foreign trade of Great Britain and other European nations, but have also invaded the British market, and are securing a large share of the home trade. It is stated that in one industry alone (the manufacture of boots and shoes) Great Britain's trade last year was less by $5,000,000 than in the preceding year, notwithstanding that the firms engaged in this industry are said to be among the most progressive and enterprising in the way of adopting improved machinery and other manufacturing facilities. The American manufacturer takes infinite pains to adapt his goods to the requirements of the particular market in which he seeks to sell, and by liberal advertising and persistent push keeps their merits before the notice of prospective buyers. In Great Britain there are many long established businesses which have descended from father to son. This has in many instances induced the idea that the system of management and character of goods that have been successful for so long a period may safely be continued. Rapid and startling changes are, however, taking place throughout the world, bringing changes in methods and requirements of the people. The nation that studies most carefully these changes, and constantly adapts its products to the new conditions, is the one which will obtain and maintain commercial supremacy. In this regard the United States seem to stand foremost to-day among the great commercial nations of the earth, hence the strides

they are making in the development of their foreign trade.

It is gratifying to note that Great Britain is awaking to the situation and considering ways and means whereby she may hold her commercial position. History has shown that the British people when once aroused are prompt to act for the protection of their interests whether territorial or commercial. Prompt, intelligent and thorough enquiry into the subject of Britain's commercial facilities and relations with other nations would seem to be a present and important necessity, and should be followed by equally prompt, intelligent and thorough reforms in methods, where such are found to be necessary.

The United States exports to Great Britain and Ireland are valued at $600,000,000 per year, while the value of the imports from Great Britain into the United States is but 25 per cent. of that amount. The United States exports to Canada for the fiscal year ending June 30th, 1900, were valued at $109,844,378, or more than the combined imports of France, Australasia, Austria-Hungary and Russia. While profiting so largely by British and Canadian trade, the United States continues to maintain a high tariff wall against these countries. The time seems to have arrived when freer access should be demanded by Great Britain and her colonies to the United States market, and in default of reciprocity of trade there should be a nearer approach than at present to reciprocity of tariffs.

Great Britain has in her colonies commercial allies which as yet she has scarcely taken any steps towards reaping the advantage of, but which, if brought into closer relations with her, would greatly assist in extending and maintaining her commercial supremacy. Canada has shown a desire to enter into such relationship by giving a substantial preference to British goods entering this market. That this action has not resulted in greater advantage to British manufacturers is largely due to the failure of the latter to make their goods better known in Canada, as well as to adapt the goods to our requirements.

Another phase of this question, as seen by an American writer, is presented in the following extract from the Engineering Magazine, of New York: "To the outside world the most impressive lesson of the Queen's death is the magnificent stability of British institutions and the British commercial system. Not a wheel stopped, save as a token of reverence; not a tremor in values disturbed financial centres; not an uneasiness or uncertainty as to national politics caused business undertakings to waver or hesitate. Compare this with the quadrennial upheaval in the United States, where economic legislation of every kind is the football of politics, and industry follows with uncertain feet now artificially raised on an unstable platform of protection, now sinking back from the morass of free silver, certain of nothing but uncertainty with every change of chief executive. The "demise of the Crown" demonstrates anew England's industrial strength, and those who are ready to cry her downfall before her industrial rivals would do well to remember that this stability of commercial organization outweighs much mechanical aptitude. Machinery can be bought, skilful brains and hands can be hired; but stable, political and commercial systems are of slow growth, and not soon attained."

EDITORIAL NOTES.

The footing up of accounts in connection with the Paris Exhibition indicates that if there be a deficit at all, it will be but a small one, while possibly there may prove to be a surplus—depending upon the willingness of the city to purchase certain improvements of a permanent character on the banks of the Seine. The cost of the buildings and other works was $18,000,000; the expenses of administration $1,700,000; policing, lighting, etc., $2,500,000; "unforseen expenses" nearly $10,000,000; miscellaneous expenses, $250,000, a total of $23,450,000. The receipts from all sources, including subscriptions of $4,000,000 each from the city of Paris and the Government of France, amounted to $23,050,000, leaving a deficit of $400,000. This is a much better showing than was made by the French Exhibition of 1878, when the receipts fell short of the expenditure by six million dollars.

The quantity of food and other supplies required by the British Government for the South African campaign is enormous. Many classes of supplies, such as canned goods, hay, cheese and bacon, flour and salt, portable houses, wagons, bicyles, axes, etc., Canada could supply, but the bulk of the orders seem to go to the United States. As an example the war office is said to have just contracted with a United States firm for 3,000 axes. We have given British manufacturers a preference in our market, and should have a claim to British orders for products which can be as well supplied by Canada as by the United States. If the British Government are ignorant of our ability to supply many of its requirements blame attaches to the Dominion Government, and no time should be lost in putting before the home authorities the fullest possible information regarding the character and extent of our resources.

The Michigan lumbermen are believed to have abandoned their suit against the Ontario Government on account of the legislation prohibiting the export of saw logs from the province. It will be remembered that in the fall of 1899 the case was heard in the Trial Court at Toronto, when Mr. Justice Street gave judgment in favor of the Crown. The case was then taken to the Court of Appeal. The judges of that court were unanimous in holding that the Crown had the right to pass the Act and to alter the terms of timber limit licenses, or renewals of them. The decision was couched in strong terms, but notwithstanding this, the Michigan lumbermen announced their intention of appealing to the Privy Council. Apparently, however, the lapse of time has caused them to take a different view of the matter. This change of attitude will be generally admired, as in view of the two adverse decisions, there seemed little hope of their success.

The resolution introduced in the Dominion Parliament by Mr. Bennett to impose an import duty on lumber was the result of a lively discussion in the House recently. Mr. Bennett pointed out that last year Canada imported lumber to the value of $3,614,557. Much of the lumber imported had displaced the Canadian product. Col. Prior supported the motion in the interest of the lumbermen of British Columbia, and was followed by another supporter in the person of Mr. John Charlton, who contended that it was a question of equal rights. As a matter of sentiment alone he believed in meeting the American duty. He thought we should make it clear to the American people that Canada at last intended to stand on her own rights and protect her own interests. The resolution was strongly opposed by Mr. W. C. Edwards, the well-known Rockland lumberman, who, however, is an out-and-out free trader. In view of the announcement of the Finance Minister that no changes are to be made in the tariff, it is feared that the lumbermen will obtain no relief at the present session of Parliament at least. The present situation, it may be said, is not one of free trade, but of discrimination against our own industries, as the markets of this country are thrown open to the United States manufacturers, while a $2 duty excludes much of our product from that market.

The quality and dimensions of the lumber produced in Canada to-day are inferior to that produced twenty or thirty years ago. This is equally true in all other countries of the world where the timber supply has become more or less depleted. For this reason it becomes imperative that the lumbermen should manufacture their timber in such a manner as to produce lumber of the best possible quality. This, we fear, is not always done. One class of lumber which calls for special attention in its manufacture is basswood. It is sawn both in the winter and summer seasons, but for most purposes winter-cut basswood is superior to that cut in summer. The logs sawn in summer are usually allowed to remain in the water for some time. The result is that after about one week in water the sugar in the log causes a fermentation, and if allowed to remain for a longer period this fermentation is converted into a substance resembling vinegar, which gives forth a most disagreeable odor. The action of this fermentation is to discolor the lumber, making it inferior to the white basswood which is obtained by winter sawing. Of course, the millman must be governed by circumstances. In many cases the equipment of mills is such as to make practical only summer sawing, while the distance of the timber from the mill renders it necessary from an economical standpoint to float the logs to the mill. It is profitable, therefore, that a large proportion of our basswood will continue to be sawn in summer, but the advantages of winter cut stock should not be forgotten.

PERSONAL.

Mr. Albert Mitchell, shipper for the Rat Portage Lumber Company, was found dead in the Ottawa hotel at Rat Portage on March 10th.

Mr. John Firstbrook, president of the Firstbrook Box Company, Toronto, is at present in Mexico with a view of extending the business of the firm in that country.

Mr. C. Beck, president of the C. Beck Manufacturing Company, of Penetanguishene, Ont., left last month on a tour of England and the Continent, combining business with pleasure.

Mr. J. Hobson, of Toronto, has been appointed secretary of the Canadian Yukon Lumber Company, with headquarters at Dawson City, and left last month for his new field. The Canadian Yukon Lumber Company operate saw and shingle mills and own twelve berths on the Pelly, Yukon and Stewart rivers, the chief timber of which is spruce.

(Con inued from Page 9.)

to the cutting away of the forest. Heavy storms were more common, and the streams were drying up. As the trees are taken off there is nothing left to retain the moisture. In some sections arable land had been destroyed by the drifting of sand from the lake shores. He believed that the farmers recognized the advantages of planting trees and preserving the present supply, and if the principles of forestry were outlined systematically, he thought it would do much towards checking the destruction.

As showing the great dsstruction of timber which has taken place, Mr. Little read extracts from a letter dated Thorold, Ont., April, 1826, written by his grandfather to a friend in Dublin. In this letter reference was made to the timber on his farm, pine trees 120 feet long which squared 20 to 30 inches for half their length, and oak which squared five feet. This timber, however, was cut down within ten years. The custom of the country at that time was to give one-half the timber for the sawing of it. Mr. Little referred to the enhanced price of timber at the present time as compared with twenty or thirty years ago. Quoting from the CANADA LUMBERMAM, he said the present price of square white pine, 40 to 45 feet average, was 45 cents at Quebec. He had taken out white pine averaging 145 feet and sold it for 25 cents per cubic foot. He submitted figures showing the decadence of the square timber trade, which he said was an indication that the timber supply was becoming exhausted.

Mr. John Waldie explained that the reason why the lumbermen had largely abandoned the square pine business was that it was a very wasteful method of lumbering. By manufacturing the timber into lumber nearly twice as much timber would be obtained out of the tree. The taking out of board pine occasioned much waste, leaving large stumps in the bush, and lumbermen had become more accustomed to look upon the economical side of the question. Mr. Waldie said that when he was in Florida last winter he was told by some friends there that their timber tracts had been burned over, but that the timber had not been destroyed. He asked for an explanation of this.

Dr. Schenck replied that the long-leaf pine is clad in a bark that fire cannot penetrate. Under certain circumstances fires running annually were of advantage in clearing up debris, etc.

Mr. Thomas Southworth said that it was becoming to be more generally recognized that the aims of scientific foresters were not inimical to the interests of lumbermen. Concerning fire, he said that some three years ago his department had asked the opinions of a number of prominent lumbermen as to the practicability of burning the debris in the wet spring. The universal reply was that the method was too expensive to be practical. The Ontario Government were just now interested in the forestry problem, being desirous of deciding upon some practical and commercially successful method for cutting over the new reserve, which contained from three to four billion feet.

Mr. Bertram stated that a pine forest was practically covered with needles, branches, debris, etc. He would like to know how far the seed would penetrate this debris. His plan had been to burn over the ground; this notwithstanding the main fact that we should not have fires in our limits.

Hon. J. B. Snowball dissented from the opinion which had been expressed that there are useless trees growing in the forests. While pine was the commercial timber of Ontario, spruce occupied that position in the Maritime Provinces, and in France you could get as much for hemlock as for spruce. His experience had been that pine grows much slower than spruce. He had adopted a policy of going over his grounds and taking off all the spruce trees down to 11 inches, and found that he could go over this ground five to seven years later and take off another crop.

An interesting paper on the pulp industry was then read by Mr. J. C. Langelier, Superintendent of Forest Rangers, Quebec. This paper in part appears in the Pulp Department.

Forest Insects.

A most interesting and instructive address on "Forest Insects" was then given by Dr. James Fletcher, Dominion Entomologist. Before reaching his subject Dr. Fletcher spoke of the various agents which destroy the forests. He pointed out that fire invariably injured trees. In his opinion it was a most dangerous thing to employ fire in the forest in any manner. He was glad to state that his experience had been that the lumbermen were keenly interested in preserving the forests. It was now admitted that when a fire swept through the forest before August the timber must be cut the following winter instead of the second winter, otherwise it would be found that grubs had penetrated six and eight inches. He spoke of the method called "rossing" adopted by some of the lumbermen to prevent the attack of insects. It consisted of cutting a strip from the top of the log so that air could penetrate between the bark and the log. Another method of protecting the logs was to cover them up with boughs of evergreens. The insects which attack trees, he said, were very numerous. Investigation had shown that 500 different varieties attack oak trees, and 200 pine trees. The large beetles appeared in July. He exbibited a number of specimens of various insects.

DISCUSSION.

Mr. W. C. Edwards, M. P., was called upon to address the meeting. He said that the question of forestry was one in which he was much interested. He was the prime mover in securing the establishment of the present system of forest protection in Quebec. In that province alone disastrous fires had occurred, destroying timber which, if growing to-day, would be worth from two hundred to three hundred million dollars. It was not yet too late, however, to preserve our forests. As to the pulp industry, he thought that the development was likely to be too rapid for the good of the country, as it was conducive to the cutting of small logs.

A paper on "Forest Botany in the Schools" was submitted by Dr. W. H. Muldrew, of Gravenhurst, Ont.

The Committee on Resolutions then reported, presenting a resolution of sympathy with the Royal Family, and another expressing the appreciation of the services rendered the Association by the president. Votes of thanks were also tendered to the authors of the various papers, the railways, the press, and the officers of the Association. Special reference was made to the faithful manner in which the arduous duties of assistant-secretary and treasurer had been d charged by Mr. Campbell.

ELECTION OF OFFICERS.

The chief officers of the Association were unanimously re-elected, as follows: Honorary president, His Excellency, the Earl of Minto, Governor-General; president, Hon. Sir Henri Joly de Lotbiniere, K.C.M.G.; vice-president, William Little; secretary, E. Stewart; assistant secretary and treasurer, R. H. Campbell. For directors the following were chosen: John Bertram and Thos. Southworth, Toronto; Hiram Robinson, Prof. John Macoun, C. Jackson Booth, Dr. Saunders, and W. C. Edwards, M. P., Ottawa.

The directors subsequently met and selected the following vice-presidents for the different provinces and districts: Ontario—Mr. J. B. McWilliams, Peterborough, Ont.; Quebec—Hon. S. N. Parent, Commissioner of Crown Lands, Quecec; New Brunswick—Hon J. B. Snowball, Chatham, N. B.; Nova Scotia—Dr. A. H. MacKay, Superintendent of Education, Halifax; Prince Edward Island—Sir Louis Davies, Minister of Marine & Fisheries, Ottawa; Manitoba—Mr. Stewart Mulvey, Winnipeg, Man.; Assiniboia—J. S. Dennis, Deputy Minister of Public Works, Regina; Saskatchewan—Mr. J. G. Laurie, Battleford, Sask.; Alberta—Mr. William Pearce, Calgary, Alberta; Athabaska—Mr. Frank Wilson, Ft. Vermilion, Atha.; British Columbia—Mr. H. Bostock, Ducks, B. C.; Yukon—The Commissioner; Keewatin—The Lieutenant Governor of Manitoba, Winnipeg, Man.

EVENING SESSION.

An evening session was held in the assembly hall of the Normal School and was in the nature of an address on "Governmental and Private Forestry," by Dr. Shenck. The large attendance present was an indication of the interest which is taken by the public in the forestry question. The chair was occupied by Mr. William Little, vice-president of the Association. The lecture was illustrated by a number of excellent stereoptican views. In dealing with Governmental forestry Dr. Schenck said that if the forests of the country were to be a financial success they must have Government protection from fires. Eliminate forest fires and the forest would perpetuate. Referring to Germany, he said there was no rivalry there between agriculture and forestry, as whatever was the best investment for the land was adopted. Experiments conducted in Germany for twenty years had proven that the forest was not a rain maker. He spoke at some length on private forestry, and at the close was accorded a hearty vote of thanks.

LUMBER SURVEYORS' ASSOCIATION.

The lumber surveyors of St. John, N. B., have formed themselves into an association, to be known as the St. John Lumber Surveyors' Association. The purpose is to protect the interests of lumber surveyors. The by-laws of the Association provide that the scale of prices for surveying lumber shall be as follows: Spruce deals and battens, 7 cents per M; scantling and boards, 10 cents; hardwood deals, etc., 10 cents. The fee for furnishing extra survey bills per lot where there is more than one lot is to be 25 cents for spruce and 50 cents for hardwood. A clause provides that no member of the Association shall deliver lumber to any vessel where she is receiving cargo from an outside surveyor when any member of the Association is idle, nor shall any member of the Association work for any shipper employing the same. The officers are: F. E. Hill, president; C. F. Langan, vice-president; H. J. McLoon, secretary; C. Robertson, treasurer.

CANADA LUMBERMAN

WEEKLY EDITION

The Lumberman Monthly Edition, 20 pages } $1.00 PER YEAR { The Lumberman Weekly Edition, every Wednesday

THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN, THE UNITED STATES, AND OTHER FOREIGN MARKETS.

VOL. VII. TORONTO, ONT., MARCH 27, 1901 No. 9

CANADA LUMBERMAN

PUBLISHED BY

The G. H. Mortimer Publishing Co'y of Toronto, Limited

Confederation Life Building - TORONTO.

Branch Office:
IMPERIAL BUILDING, MONTREAL.

Weekly Lumberman, published every Wednesday. Contains reliable and up-to-date market conditions and tendencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canaian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

WANTED AND FOR SALE

Advertisements will be inserted in this department at the rate of 15 cents per line each insertion. When four or more consecutive insertions are ordered a discount o. 25 per cent. will be allowed. This notice shows the width of the line and is set in Nonpareil type; 12 lines make one inch. Advertisements must be received not later than 4 o'clock p.m. on Tuesday to insure insertion in the current week's issue.

COMPETENT BAND SAW FILER OPEN FOR engagement. Good References. Box 181, LUMBERMAN.

HEAVY PLANER, MATCHER AND MOULDer, in good order; cheap for cash. J. S. FINDLAY, Owen Sound.

FOR SALE.—36 in. Wickes Gang, cutting 14 in deep; located in Canada; price low. WICKES BROS., Saginaw, Mich.

FOR SALE—ONE MILLION FEET GOOD White Pine Mill Culls, Dry. Address "OTTAWA," office CANADA LUMBERMAN.

FOR SALE.

15,000 feet dry firsts and seconds 2 in. maple. H. S. MILNE, Brown's Corners, Ont.

PERSONS HAVING GOOD BEECH TIMBER Lands for sale are requested to send particulars of quantity, price and situation to the undersigned.
GORDON & SAMPSON, 157 Bay St., Toronto.

WANTED— PARTY WITH $2,000 WANTS interest in a good saw mill, or a small mill with established business to buy. Will entertain any scheme in the way of lumber manufacturing. Give full particulars. Address W. B., CANADA LUMBERMAN.

FOR SALE.

THIRTY-TWO INCH RUN OF STONE'S Swing Shingle Machine, Wheel Jointer, Lath Machine. Will exchange for lumber. R. J. DOUGALL, Hallville, Ont.

WANTED.

ONE CARLOAD OF 1 INCH CEDAR Boards, to be clear one face, 4 inches and up wide 8 to 16 feet long, 10% 5 to 8 feet long—either green or dry, for Eastern market. Box 18, CANADA LUMBERMAN.

SAW FILER WANTED

A FILER WANTED, ACCUSTOMED TO CIRcular Saws. Apply by letter to JAS. H. SANDERSON, Prince Albert, Saskatchewan.

FOR SALE.

SAW AND PLANING MILL COMBINED, AT Acton, Ont.; well equipped and machinery in perfect order. Plenty of timber with which to operate for many years; wood business in connection. Business well established and profitable. *For further particulars and terms apply to the proprietor.

JAMES BROWN,
Acton, Ont.

WANTED

GREEN HARD MAPLE SQUARES, 6½ x 6½ in., 12 feet and up. Cash on delivery at any station in Ontario or Quebec. Address Box 40, CANADA LUMBERMAN.

LUMBER WANTED

WE WILL PAY CASH FOR 2 IN. COMMON Red or White Pine, 6 to 10 in. wide, 12 to 16 ft. long, (dry or green), next season's delivery, delivered in Toronto. A. BRYCE & CO., 2 Toronto Street, Toronto.

FOR SALE.

THE PLANT OF A FIRST-CLASS CIRCULAR Saw Mill (Waterous make), consisting of one steam fed mill and one rope feed, with belting, pulleys, automatic emery grinder, double edger, butter, &c.—all in good order. Price low. Apply to J. K. WARD, Westmount, Que.

FOR SALE.

A LARGE QUANTITY OF GOOD SOUND Tamarac lumber in standard sizes, 2x4, 2x6, 2x8, etc.; Dimension timber, 16 ft. long, 4x4, 4x6, 6x8, 8x8, etc. Also other sizes cut to order. Apply to EDWARD LLOYD, Limited, Sturgeon Falls, Ont.

WANTED

1, 1½ and 2 x 12 in., 12 to 16 ft., White Pine Stocks, Dressing and better preferred. State quantity each, with lengths and price. Box 30, Canada Lumberman.

For Sale—The following Red Pine Lumber

120 M 1 in. x 4 in. and up x 6/19 ft., only 5% 6/11 ft.
25 M 6/4 in. x 4 in. and up x 12/19 ft.
207 M 8/4 in. x 4 in. and up x 6/19 ft., only 3% 6/11 ft.

Quality Log Run. Mill culls out. Cut 1900 For particulars apply to MASON, GORDON & CO., 589 Temple Building. Montreal, or Mason Mills, Ottawa.

Virgin Timber Berths

BY AUCTION

TOWNSHIP OF "ERMATINGER"

(North Shore of Lake Huron)

The Timber Licenses for the above Township will be offered for sale by Public Auction, on

Thursday, April 18th, 1901, at 2 p.m.

At the Board of Trade Rooms, Toronto,

subject to the terms and conditions which will be announced at the time of sale.

Lot 1.—The South-East Quarter of the Township, 9 square miles, more or less.

Lot 2.—The South-West Quarter of the Township, 9 square miles, more or less.

Lot 3.—The North-West Quarter of the Township, 9 square miles, more or less.

Lot 4.—The North-East Quarter of the Township, 9 square miles, more or less.

The Township of Ermatinger is one of the best berths in the province and can be cheaply lumbered. It has been recently examined for the owners by James Barclay, Cheboygan, and the estimates will be furnished to lumbermen who wish to examine the berths.

Terms of payment.—One fourth in cash at the time of sale, and the balance in one, two and three years with interest at 6 per cent. per annum, payable annuall .

For further particulars and maps, apply to E. R. C. Clarkson, Ontario Bank Chambers, or to

PETER RYAN,
Toronto.

FOR SALE.

WATER POWER SAW MILL, CAPACITY 20 to 25 M per day, together with Horses, Waggons, Sleighs, Cart, Harness and whole outfit, fully equipped, with or without stock of logs; would give purchaser contract to cut logs. Price very reasonable. Address Box 255, CANADA LUMBERMAN.

CURRENT TRADE CONDITIONS.

ONTARIO.

Lumber manufacturers and dealers are apparently satisfied with the volume of business they are doing; it is quite up to the average for this season of the year, with indications of much more activity in a week or two as a result of the commencement of spring building operations. The quantity of lumber required for building purposes is expected to be greater than last year, and with an average consumption by manufacturing industries, a good season's trade at satisfactory prices is looked for. In Ottawa the buildings commenced and under contemplation are chiefly of the cheaper class, calling for the lower grades of lumber. As a result of a by-law passed in Ottawa some time ago preventing the use of wooden shingles on houses, the local demand for shingles is extremely quiet, but a good enquiry is reported from outside points. In the Georgian Bay district sales of pine mill culls are being made at $10.50 and $11 at the mill. Michigan dealers are looking to Georgian Bay points to supply a considerable quantity of the stock required for the coming season.

There is some irregularity in hardwood prices, and the market is not as firm as might be wished for. In Toronto some dealers are asking $24 for first and second black ash, 1 and 1½ inch, which others are quoting at $22. Mill run is selling at $18, with $20 asked in exceptional cases. There is practically no basswood offering in firsts and seconds, but from $20 to $22 could be realized for good stock. Mill run basswood is selling at $17.

QUEBEC AND NEW BRUNSWICK.

Influenced by favorable reports from the Eastern States, the spruce lumber market is showing more strength. Manufacturers are looking forward to an active demand from the United States and to a considerable consumption of lumber for local purposes, paticularly of the cheaper grades. While the price of clapboards is nominally unchanged, the supply is so small that if there should arise even a moderate demand, it would be reflected in higher prices. The supply of New Brunswick cedar shingles is likewise small. Sellers are asking $3 for extras, $2.65 for clears, and $2.20 for second clears, Boston rate of freight, although sales are being made by small manufacturers about five cents less.

UNITED STATES.

A most satisfactory volume of business for the past week is reported from the white pine producing points. In the Ashland and Duluth districts the buying by wholesale dealers has been quite active, and most of the stock is now held $1 to $1.50 higher than last fall. Sales of No. 3 boards are being made at $12.75, and some manufacturers are holding out for $13 for the coming season's cut of that grade. This is about $1 in advance of the price at which this grade was sold last summer, and shows the steady appreciation in the value of pine lumber. The feeling in the Lake Superior district is that the spring will bring forth a sharp demand for lumber, and that the year will be one of general prosperity for the lumber trade. Indications are that the cut of logs for the mills of Duluth-Superior will be not more than 390,000,000 feet, as compared with 425,000,000 feet last winter. Buyers in the east are apparently convinced that there will be no break in prices, and are therefore placing contracts for their supply of lumber. In the Chicago market there is a scarcity of No. 1 and No. 2 12-inch boards, and piece stuff is none too plentiful. Both white and Norway pine piece stuff is selling at $14.50 to $15 for short lengths f.o.b. cars Chicago. Tonawanda trade is more settled, with less cutting of prices on the coarser grades. Good lumber seems to be most wanted in the east, although some demand has developed for box lumber.

There is no perceptible improvement in the call for hardwoods. The better grades are selling more freely than cheap lumber, but the large consumers are apparently keeping out of the market as long as possible. Maple is showing more strength, while birch and elm are weak. Basswood still leads both in point of demand and scarcity of supply.

GREAT BRITAIN.

The British timber market continues to be somewhat unsettled. Swedish shippers are firm in their prices for deals, but the White Sea exporters are said to be offering to accept a reduction of ten shillings per standard from late asking prices. This has led importers to look for a general decline in prices, and consequently buying is at a standstill. So far as Canadian deals are concerned, however, the market seems to be steady, al-

though the reports are rather contradictory. From one source of information it is learned that pine and spruce deals have been sold heavily at high prices, while another report states that contracting in pine goods for the coming season has been on an unusually restricted scale. The most reliable advice is to the effect that the quantity of pine and spruce placed with importers is slightly less than last season. Concerning spruce deals at Liverpool, a correspondent says: "The stock in this market is heavy, and the large shipments that have been coming forward have upset the calculation of a good many with regard to this class of timber. It would be an advantage to the trade generally if the import could be restricted, as sales are being made at low prices, and a weakening effect is the result."

STOCKS AND PRICES.

J. E. Moore & Company have completed sawing operations at Bonny River, N.B., having cut 1,200,000 feet of lumber.

Gibson Bros., of Wroxeter, Ont., are cutting a large quantity of maple rollers and 1½ inch square chair leg stock.

The W. & A. McArthur Company have put in 30,000,000 feet of logs during the past winter, and expect to operate their mill at Little Current, Ont., day and night this season.

Two tenders were received last week for the supply of lumber for the Board of Works, Hamilton. Brennan & Company tenderd at 17.51 per thousand, and W. J. McAllister at 17.15, the latter being accepted.

At Cleveland there is a scarcity of lath. No. 1 white pine is selling at $4, No. 2 white pine at $3.50, and hemlock at $3. The demand from country yards is fully one-third greater than at the same time last year.

The sale of the timber on Grand Island, in Haliburton county, is reported. Seven hundred acres are included in the deal, by which the Standard Chemical Company, of Fenelon Falls, get the maple, birch and beech, the Rathbun Company the cedar, pine, hemlock, and T. H. DeCew & Sons, Fenelon Falls, the elm, ash and basswood.

Fears are expressed for the British barque Elizabeth Nicholson, which sailed from New Westminster on November 26th last for Shanghai with 638,652 feet of lumber valued at $6,678.

The Georgian Bay Lumber Company, of Waubaushene, Ont., have closed a successful season's logging in the Blind River district. They have taken out upwards of 100,000 pieces, which will yield in the neighborhood of 11,000,000 feet.

The steamer Dundee last week completed loading 1,713,000 feet of lumber at Chemainus, B.C., for a foreign port. The German Barque Antuco is now loading lumber at Hastings mill, Vancouver, and the ship Anna is under charter to load at same point.

The Calhoun Lumber Company expect to cut during the coming season about 5,000,000 feet of spruce at their mills at Gaspe Basin, Que., about the same quantity at Calhoun, N.B., and about 3,000,000 feet at Albert, N. B. Practically all the stock will be for the British market.

A quantity of spruce deals, ex Grecian from Halifax, N.S., was sold by auction at Liverpool last week by Alfred Dobell & Company. The deals were 9 feet and up, and brought the following prices: 4 x 7, £7 5s per standard; 4 x 5, £7; 3 x 12 and up, £7 17s 6d; 3 x 10 and 11, £9; 3 x 9, £7 7s 6d; 3 x 8, £7 2s 6d; 3 x 7, £6 15s; 2½ x 7, £6 7s 6d; 3 and 2½ x 6, £6 15s; deal ends at £6.

A correspondent at Fort Frances, Ont., writes that Seaman & Company are finishing up their cut in the woods near that place. The cut of their different contractors will be about as follows: Tierney & Fraser, two camps, 5,000,000 feet logs, 25,000 ties, and a considerable quantity of piling 45 to 80 feet long; Bartley & Mosher, two camps, 300,000 feet logs, balance tamarac piling, 20 to 80 feet long; G. Franson, one camp, 200,000 feet logs and considerable piling. Seaman & Co. have moved one of their mills from Lake Shebandowan to Little Turtle Lake, and are taking 250,000 feet of lumber of last season's cut from their mill at Gash Point to stock their new lumber yard at Fort Frances, to supply the local trade. At Gash Point they have a stock of about 1,750,000 feet of lumber and timber.

The Shuswap Milling Company's saw mill at Kamloops, B. C., was destroyed by fire recently, at a loss of $30,000.

WINNIPEG LUMBER PRICES.

Following is the new retail price list for Winnipeg which went into effect March 1st, 1901:

DIMENSION NO. 1 PINE.

2x4 to 2x12, 6 and 8 ft., $16; 2x4, 10 ft., $22.50; 2x6, 10 ft., $19.50; 2x8 to 2x12, 10 ft., $19.50; 2x4 to 2x12, 12, 14 and 16 ft., $19.50; 18 ft., $21; 20 ft., $22.50; 22 ft., $23.50; 24 ft., $25; 26 ft., $26; 28 ft., $27.50; 30 ft., $28.50; cull plank, all widths, $14.

TIMBER NO. 1 PINE.

3x6 to 3x12, 4x4 to 4x8, 6x6 to 6x8, 12, 14 and 16 ft., $21; 18 ft., $22.50; 20 ft., $24; 22 ft., $25; 24 ft., $26; 26 ft., $27; 28 ft., $27.50; 30 ft., $29; 4x10 to 6x12, 8x8 to 12 x 12, 12, 14 and 16 ft., $23; 18 ft., $24; 20 $25; 4x10 to 6x12, 8x8 to 12x12, 12, 14 and 22 ft., $26; 24 ft., $27; 26 ft., $28; 28 ft., $29; 30 ft., $30.

Tamarac dimensions and timber same price as pine. Spruce dimensions and timber $2 per M less than pine. $1 per M advance on each inch over 12 in. depth and width.

Extra dressing one side $2, two sides $3, three and four sides $4.

BOARDS.

ROUGH OR D. 1 S., 10 TO 18 FT.—1st com. white pine, or C select, $36; red pine, $29; 2nd com. R. and W. pine, $22.50; 8 and 10 ft. stock, $24; 12 ft. stock, $25; 3rd com. R. and W. pine, $19.50; spruce boards, $18.50; No. 1 cull pine or spruce, $17, No. 2, $13; 2nd com. ½ in. S. 1 S., $17.50; 8 ft. longand less, deduct $2; No. 1 box boards 14 in. and up, $36; No. 2, $26; extra dressing per M add, $2.

SIDING, FLOORING AND CEILING.—8x10 in. pine and spruce, $26; cull, $22; 2nd white pine 4, 5 and 6 in., $41; 2nd red pine 4 in., $33; 2nd red pine 3 and 6 in., $34; 3rd white pine 4, 5 and 6 in., $34; 3rd red pine 4 in., $29; 3rd red pine 5 and 6 in., $28; 4 R. and W. pine 4 in., $22; 5 and 6 in., $24; native spruce 4, 5 and 6 in., $23; cull R. and W. pine and spruce, $17.50: 8 ft. long and less deduct; $2; dressing two sides add $2; 1¼ and 1½ thick, add $1; bevel siding No. 1 ½x6 in. $29; No. 2, 26 in., $26.

SHIPLAP.—8 and 10 in. pine, $22; 6 in. pine, $21; 8 and 10 in. spruce, $21; 6 in. spruce, $20.50; 8 and 10 in. cull pine or spruce, $18; 6 in. cull pine or spruce, $15.50; ½x6, 8 and 10 in. pine, $18.50.

FINISHING.—1¼, 1½ and 2 in. white pine 1st, 2nd and 3rd clear, $65; select, $48; shops, $40.50; Red pine, clear, $42; select, $37.50; for 2½ and 3 in. add $6.50; 4x4 to 6x6 shop W. P., $47.50; select, $54.

ONE INCH.—White pine 1st and 2nd clear, $64; 3rd clear, $50; B select, $41; C select, $36; No. 1 stock 12 in., $56; 8 and 10 in., $52.50; No. 2 stock, 12 in., $50; 8and 10 in., $48; No. 3 stock12 in., $40; 8 and 10 in., $38; red pine, clear, $44; select, $36.

THE ONTARIO TIMBER SUPPLY.

In the Ontario Legislature recently, Mr. W. A. Charlton, M.P.P. for South Norfolk, gave a great deal of information respecting the timber resources of the province. The Doyle system of measurement had been unanimously adopted by the lumbermen of the province in 1879, in preference to the Scribner. The total cut of saw logs since Confederation was 15,896,156,278 feet ; of boom timber 681,847,463 feet ; of square timber, 2,092,804,152 feet, a total of 18,670,807,893 feet, and an average of 549,141,408 feet per year. More than the average, or 679,000,000, was reached as early as 1872. In 1882 the cut was 623,000,000, and in 1892 694,000,000. The largest cut of any year was in 1896, 952,000,000 feet ; the next in 1895, 843,000,000 ; the third in 1889, 818,000,000, and the fourth in 1888, 781,000,000.

Mr. Charlton declared that the whole export of sawlogs to the United States since Confederation (none occurred before 1889) was only 1,529,324,917 feet, so that less than 10 per cent. of the logs had been exported, and over 90 per cent. were sawn in this province. The total revenue from pine timber since Confederation had been $26,582,883, an average of $781,846 a year. There were 26,000 square miles of timber land in Ontario west of the Ottawa river and south of the 48th parallel of latitude, and in the Rainy River district ; that meant twenty-six billion feet, at the moderate estimate of one million feet per mile. To this should be added eight billion feet on land under license, making thirty-four billion feet in all.

The government report of 1893 embraced an area of 20,000 square miles under license, then estimated to have on it ten billion feet. As a fact, since that estimate, based on 1887 examination, ten billion feet had been taken. Mr. Charlton said he had personal knowledge that large quantities remained uncut, estimated at eight billion feet. A United States Government commission in 1880 estimated Minnesota's timber at ten billion feet. Since then twenty billion feet had been cut, and twenty billion more feet were left. He reminded the House that in addition to the three billion feet referred to by the honorable treasurer as existing in Nipissing, there were 30 townships south of that portion which were rich in pine timber.

He approximated the value of the 26,000,000,000 feet as worth to the government as it stands $91,000,000, and the crown dues to be collected from the 8,000,000,000 feet on the licensed lands would not be less than $9,000,000, making an asset of $100,000,000 in pine timber alone, leaving all the other timber, land and minerals in the hands of the government.

Respecting the areas of the north, Mr. Charlton pointed out that Nipissing contained 27,000 square miles, 16,000 explored ; Algoma 65,000, 20,000 explored ; Thunder Bay, 31,000, 15,000 explored ; Rainy River, 19,000, three-quarters explored. Total area, 140,000 square miles, less than half explored. Col. Matheson had estimated the pulp wood on Mr. Clergue's concession at ten cords to the acre. On this estimate the treasurer's estimate of 288,000,000 cords would be more than doubled. Mr. Charlton said he had been over the height of land at different points, and had personal knowledge of the existence of large tracts of valuable farming lands.

REMARKS ON HARDWOOD AND OTHER FINISHING.

The practice, which is now fairly established in Canada, of finishing two or more rooms in good houses, with hardwood, is a commendable one, and deserves to be extended to all rooms in the main stories of good dwellings. There is no lack of good and suitable hardwoods in the Dominion, and in some instances these woods may be obtained at a less cost than clear white pine, and the cost of working and finishing them is perhaps 25 or 30 per cent. more than for the same character of work in pine, while the results are a hundred times happier.

Black birch (Betula Nigra), which is a native of this country, is especially adapted for inside finish, and when properly wrought, has a fine quiet refined appearance, and for the last fifteen years has been quite popular. It is close-grained, and can be stained with a filler to resemble walnut exactly. It is just as easy to work, and is suited for any of the purposes to which the more costly wood is applied.

To give birch the appearance of cherry or mahogany, it should be rubbed with diluted nitric acid, after it has been planed and finished up with either scraper or No. o sandpaper. Afterwards, to a filtered mixture of one ounce and a half of dragon's blood dissolved in a pint of spirits of wine or alcohol, add about half an ounce of carbonate of soda, the whole constituting a very thin liquid which must be applied to the work with a soft brush. This process must be repeated with very little alteration, and at short intervals of time, until the work assumes the tint required. If the work has been well done and the composition properly made, the surface wil assume quite a brilliancy. To complete the work, raw linseed oil should be rubbed over the surface and wiped dry, as no portion of the oil should show on the work. This same process will answer for finishing cherry—which is now getting to be a very scarce wood—which shows more veining in the finish than birch.

Cherry may be darkened by coloring the spirits of turpentine used in thinning down the filler, but, when no filler is used, it may be washed down with lime water, which will give it a desirable color. It is best always to try a piece of the wood before washing down the work to insure the proper tint.

Where it is desired to stain white pine, cedar, poplar or basswood, to give an appearance of cherry or black birch, any one of the following compounds may be used :

For a water stain, boil in a gallon of water one pound of Spanish anneto and one ounce of concentrated lye (potash) ; should this not be deep enough, allow the water to evaporate by a gentle heat. The stain can also be made darker by adding gamboge previously dissolved in a weak solution of potash.

For a good oil stain for pine make the following :—Mix gamboge in linseed oil, dilute with turpentine, add a little japan as a siccative, apply with a fine hair brush, not too thickly. This produces exactly the same tint as the water stain, but will not fade as the other may in some conditions. The tint may be deepened by adding a little dragon's blood or burned sienna finely ground in linseed oil.

Another durable stain may be made by stirring and well mixing together one quart of spirits of turpentine, one pint of varnish, and one pound of dry finely ground sienna ; apply with a brush and after it has been on about five minutes wipe it clean off with rags. This stain requires about twelve hours to dry, after which it may be varnished and rubbed.

A better stain than either of the ones given may be made by taking one quart of alcohol, two ounces of dragon's blood ; pulverize the latter along with about a quarter of an ounce of alkanet root ; mix and let stand in a warm place for several days, shaking it up from time to time. Apply with a sponge or a fine brush, giving a thin coat at first. Two or three coats may be required to give the proper tint.

This stain penetrates the wood for some depth, and when properly varnished and rubbed down, makes the soft wood look exactly like cherry or birch, as the case may be.

When "rubbing" is not desired, a coat of good shellac varnish will make a very fine soft finish and show up the grain of the wood to perfection.

There are over forty kinds of oak, natives of the American continent, about ten of which grow in Canada, and of these the white oak, (Quercus Alba,) the red oak, (Quercus Rubra,) and the black oak, (Quercus C. Tinctoria,) are the most employed in interior finishings and furniture, and are all capable of being handsomely finished, the black and white oaks being the best, and the red being next.

What is known as quarter-oak is made by first sawing the log from end to end through the middle. Then each half is sawed from end to end through the middle, thus leaving four quarters. Each quarter has only three sides, one side the bulge part of the log, and the other two sides flat and coming to an edge. The boards are sawed off the sharp edge, and each sawing, therefore, throws off a board wider than the one before it. Sawing the quarters of the log in this manner, lumber possesses that beautiful cross-grained figure that is so much admired in oak.

To make a good imitation of antique oak, lamp black or vandyke brown should be mixed with the wood filler, and the latter should be made about the consistency of thin cream and applied with a brush. After standing an hour or so, the superfluous filler should be removed with excelsior and cleaned off with rags. When hard and dry the work may be varnished or otherwise finished.

Another method of imitating antique oak is to expose the wood to the fumes of ammonia, but as this is only possible with small works, the application of aqua ammonia with a brush is resorted to with a fairly good effect. Several applications must be made to get the required shade.

A quicker, and perhaps better method, is to use strong vinegar with iron filings or shavings added ; by a little experimenting, this can be made to suffice with one coat, depending upon the amount of iron added to the mixture.

The ammonia and vinegar processes answer effectively only on white and black oak. Red oak must be treated with stains mixed with the fillers, when excellent results follow.

The British Columbia Mattress Works, of Vancouver, B.C., have put in machinery for the manufacture of excelsior. They recently received a car load of cotton-wood for the purpose.

THE NEWS

—Louis Bachelor, saw miller, Milverton, Ont., has sold out to Peter McLellan.

—C. McGiven is making improvements to his saw mill at Penetanguishene, Ont.

—A wood-working factory will be built at Sussex, N. B., by George H. and S. H. White.

—Haley & Son, of St. Stephen, N.B., are engaged on a contract to supply 10,000 boxes for a Glasgow firm.

—The Firstbrook Box Company, box manufacturers, Toronto, are about to erect a new factory, 80 × 300 feet.

—George Chew is reported to have sold an interest in his saw mill at Midland, Ont., to E. Letherby and Manley Chew.

—It is said that the Victoria Harbor Lumber Company, of Victoria Harbor, Ont., may purchase anonther shunting engine.

—The legislature of Oregon has appropriated $30,000 for a forestry exhibit at the Pan-American Exposition at Buffalo.

—John Sinnott will establish a lumber yard at Gilbert Plains, Man. He also intends reopening his yard at Dauphin.

—R. S. Staples and John Kennedy, of Pontypool, have purchased the saw mill and timber limits owned by D. P. Ridge.

—Ross Bros. have purchased the saw mill property at Balmoral, N. S., owned by the estate of the late A. M. Sutherland.

—The box factory at Dollartown, Ont., recently owned by Firstbrook Bros., has been purchased by Mr. Potvin, of Midland, Ont.

—It is the intention of C. J. Willis & Company, wholesale lumber dealers, Sackville, N. B., to remove on May 1st to Amherst, N.S.

—The dissolution is announced of the firm of I. S. Charbonneau & Company, sash and door manufacturers, St. Louis du Mile End, Que.

—The saw mill of H. & F. Duffy at Seven Mile Lake, N.S., was destroyed by fire recently. The headquarters of the firm are at Liverpool, N.S.

—Josiah Keane, of Fesserton, Ont., is making extensive improvements to his saw mill, putting in a circular and machinery for the manufacture of barrel hoops.

—D. McQuaig, who has been operating a planing mill at Portage la Prairie, Man., has accepted a position as manager of the mill there until recently operated by J. M. Taylor.

—The British Columbia Mills, Timber and Trading Company, of Vancouver, have decided to go out of the retail lumber business at Winnipeg, and will henceforth confine their attention to the wholesale trade.

—A number of prominent lumbermen, including Alex. Fraser, John Charlton, M.P., J. R. Booth, John Gilmour and W. C. Hughson, have petitioned the Dominion Government for the extension of the Gatineau River Railway to James Bay.

—It is reported that the Cleveland Saw Mill & Lumber Company have secured a favorable site and will erect a large saw mill near the mill of the Edmund Hall Lumber Company at Sarnia, Ont. The company is said to own a quantity of timber in the Georgian Bay district.

—Several capitalists recently looked over the situation at Fort Frances, Ont., with a view to erecting large saw mills there. A local exchange states that if suitable arrangements can be made for timber supply and water power, steps will likely be taken at once to establish the mills.

—The annual meeting of the St. John River Log Driving Company will be held at Fredericton, N. B., on Wednesday, April 3rd, and that of the Tobique River Log Driving Company at Andover, N. B., on Tuesday, April 9th. The former company will let the contract for driving on the Upper St. John for the next four years.

—The annual meeting of the Upper and Lower Southwest Miramichi Log Driving Companies was held at Fredericton, N.B., on March 12th. M. Welch was elected president of the Upper Southwest Company, with J. H. Barry secretary-treasurer, and in the Lower Company William Richards was re-elected president and H. Beck secretary-treasurer.

Mr. Francis Baker, lumberman, of Gravenhurst, Ont., was accidentally drowned in an uncovered well at Utterson, Muskoka. Mr. Baker was well known and highly respected by the lumbermen throughout the province.

—Hon. William Engel, of Bangor, Me., recently purchased timber limits on the Nepisiguit river in New Brunswick. Speaking of the purchase he said: "I won't operate the land at present. I wanted the property in case of emergency such as the giving out of the supply of logs for pulp purposes on the Penobscot."

—Messrs. Beardmore, Patton, and Wells, who recently purchased lumber property at St. Margaret's Bay, N. S., from Young Bros., are applying for incorporation as the Dominion Lumber Company and the Dominion Leather Company. It is proposed to utilize the bark taken from the saw logs in the manufacture of leather.

—The following persons made application to the British Columbia Government during February for timber licenses: G. A. Carlson, Kalso, for 450 acres; E. O. Patterson, Chilliwack, 320 acres; James Mulligan, Vancouver; E. Dewnedy, Allison, 1,000 acres; Thos. J. McAlpin, 1,000 acres; Atkins & Company, Vancouver; St. Anthony's Exploration Company, Vancouver; J. A. Stoddard, Windemere, 1,000 acres; W. K. Rogers, Yale, 1,000 acres.

—Seamen & Company, of Port Arthur, Ont., have a large force of men at work getting out ties, piling and bridge timber, to fulfill their contract with the Ontario and Rainy River Railway Company. Between Fort Frances and Stanley Junction no less than six miles of open bridging will be required. Mr. Seaman states that the mill at Gash Point, managed by R. Lockhart, is cutting dressed lumber, but as soon as the ice goes out the cutting of dimension timber will be commenced. A large lumber yard has been opened by the company at Fort Frances, in charge of W. Floyd.

TRADE NOTES.

The annual meeting of the Canadian Rubber Company was held in Montreal recently. A satisfactory statement was presented and the board of directors re-elected.

A very attractive calendar has been issued by the Syracuse Smelting Works, of Montreal. In the centre are a couple of lady cyclists mounted on a tandem machine coming down a mountain side on a bar of the company's babbit metal. Below are the words "Let em slide—it is frictionless."

SUIT TO RECOVER FREIGHT ON LUMBER.

In the Liverpool assize court, before Mr. Justice Bucknil and a special jury, the Mediterranean and New York Steamship Company, Ltd., sought to recover £175 15s. 3d. from the defendants, A. F. & D. Mackay, of Liverpool, balance of freight alleged to be due for the carriage of certain timber on plaintiffs' steamer Pocohontas, from St. John, N.B., to Liverpool, where she arrived on August 8th last. The defendants stated that they had paid sufficient for the carrying of the timber, and they claimed for certain short delivery, while the plaintiffs denied that the defendants were entitled to make that claim.

Mr. Carver said that the question arose out of the carrying of a part of a cargo of timber by the Pocohontas, shipped at St. John N.B., by Mr. W. Malcolm Mcakay, and consigned to the defendants, A. F. & D. Mackay. The question raised by the defendants was that the quantity of timber delivered was less than that which appeared on the bill of lading—that the measurement was less-and, therefore, they said they were entitled to deduct from the freight the value of the short delivery. The timber was shipped under bills of lading which showed the number of pieces shipped, and the number of superficial feet in those pieces. All they had to consider was the deals, and there was no trouble about any loss of cargo, because the number of pieces turned out was slightly in excess of what was stated in the bills of lading. The number of pieces given in the bills of lading was 82,300, whereas the quantity actually turned out, according to the defendants' own counting, was 82,313 pieces. The charter party provided that the freight was to be paid one-third in cash on arrival and the remaining two-thirds on right delivery of the cargo, less the value of short delivery in cargo if there be any. The freight was also to be paid upon the intake measure—the measure taken at the port of shipment by the surveyors there—and according to a sort of summary report of the shipment sent by shippers to the defendants, they reported the quantity was exactly as the bill of lading put it, viz., 675 standards of spruce deals and 40 standards of spruce ends.

Mr. Pickford stated that the defendant's case was that they were 1,253 pieces short of deals and 806 short of ends, making 2,059, and there were over delivery on scantlings 369, and on boards 1,703, making 2,072, or 13 pieces over. His point was that the rate of freight being different on the different things they were entitled to claim shortage of ends and allow on boards.

The judge: That seems a business like point.

Mr. Carver remarked that the defendants said the plaintiffs had not given them right measurement. What the plaintiffs said was that they had to deliver the 82,300 pieces that were put on board. By the terms of the charter party, however, he contended that the measurement was to be determined, not in Liverpool by the methods adopted there, but by the intake measurement as it appeared in the bills of lading.

Mr. Pickford contended that the only question for the jury was what was the quantity on the out-turn.

His lordship agreed, and evidence on that point was called by the defendants. One witness stated that there were 1,253 deals and 806 deal ends less taken out in Liverpool than appeared in the bills of lading, while there were 1,703 boards and 369 scantlings in excess, making a net in excess of 13 pieces. In measurements, however, the shortage was 15 standards.

His lordship said that on the evidence of the defendants there was a certain excess and shortage. A certain amount had come out of the ship, and on what came out only the plaintiffs were entitled to freight, and freight was a question of law. After hearing further arguments, the judge put to the jury the following question: "Are you satisfied that the evidence of the defendants' witnesses represents truly the different number of prices under the different descriptions mentioned by them?"

The jury answered in the affirmative. His lordship reserved the legal aspect of the finding for further argument in London.—Timber Trades Journal.

WOOD PULP DEPARTMENT

THE PULP INDUSTRY IN RELATION TO OUR FORESTS.*

By J. C. Langelier.

The pulp industry has within the past fifteen years assumed a considerable development in our country. It was first mentioned in the census of 1881, which gives the following figures in connection with this industry: Capital invested, $92,000; wages paid, $15,720; value of products, $63,300. Ten years afterwards the census of 1891 gave the following: Capital invested, $2,900,907; wages paid, $292,099; value of products on the market, $1,057,810. By comparing these figures we find for this period of ten years an increase of 3,052 per cent. in the capital invested, of 1,758 per cent. in the wages paid, and 150 per cent. in the value of the products delivered to the trade.

Such extraordinary progress has produced a great impression on many people who take a special interest in the preservation of our forests; many begin to raise the alarm cry, proclaiming that before long this new industry would cause the ruin of our spruce forests. Is this alarm justified by facts, are these fears well founded? We will proceed to consider the question.

CONSUMPTION OF SPRUCE.

For a couple of years yet, that is until the next census is published, the statistics of 1891 are the only ones that can give us complete information respecting the consumption of spruce in the four older provinces of the Canadian Confederation, the only ones in which, for many years to come, the pulp industry is destined to assume all the development of which it is capable.

The data given by that census are somewhat confused, but after deducting what is necessary, we get the following figures approximately with regard to the consumption of spruce for various purposes in the four provinces in question:

	Feet.
Saw logs	2,958,926,740
Firewood	1,556,412,166
Square timber	212,582,464
Lath wood	111,889,150
Pulp wood	130,400,000
Railway ties	98,267,801
Shingles	67,749,166
Total	5,146,236,787

We get the following figures for each of the provinces respectively:

	Ontario. Feet.	Quebec. Feet.
Saw logs	1,049,450,350	968,133,170
Firewood	673,049,500	563,398,566
Square timber	51,968,283	123,530,033
Lath wood	36,631,500	64,722,750
Pulp wood	57,457,000	65,599,500
Ties	59,920,768	20,038,333
Shingles	49,398,500	7,317,666
Total	1,969,880,901	1,812,740,018

	New Brunswick Feet.	Nova Scotia Feet.
Saw logs	461,990,100	479,347,770
Fire wood	154,012,250	175,952,250
Square timber	10,604,148	26,480,000
Lath wood	5,735,900	4,799,000
Pulp wood	5,685,500	1,667,000
Ties	12,361,000	5,947,500
Shingles	.....	11,033,000
Total	650,388,898	705,226,450

What is the proportion of pulp wood? 2.53 per cent. for the four provinces together; 2.90 per cent. for Ontario; 3.51 per cent. for Quebec; 9.03 per cent. for New Brunswick; 0.23 per cent. for Nova Scotia. More than one-half the pulp wood got out in 1891 was exported to the United States in the raw state.

LIMIT OF PULP CONSUMPTION.

Let us now see whether there exists any danger for the future. By multiplying ten times the quantity of pulp wood mentioned in the census of 1891 we get the following figures for each of the four provinces:

	Feet.
Ontario	574,570,000
Quebec	655,995,000
New Brunswick	56,855,000
Nova Scotia	16,670,000
Total	1,304,090,000

Taking 600 feet superficial or board measure for a cord of 128 cubic feet, and a cord and a half of firewood to make a ton of pulp, the exaggerated quantity of 1,304,900,000 feet of spruce would give enough wood to manufacture 1,448,988, or, in round numbers, 1,500,000 tons of pulp a year. This is very nearly the total actual production of the United States, the country which makes the most pulp and paper in the world. With this quantity the four older provinces would suffice for the domestic consumption of Canada, supply a couple of hundred thousand tons of pulp to our neighbour's paper mills, and allow of our shipping a million tons to Great Britain, France, and other European countries. It would be difficult, even for the most enthusiastic, to imagine a more brilliant future for this great pulp industry.

What extent of forest would have to be denuded every year to get the spruce required to make this quantity of pulp?

In the Maritime provinces, as well as in those portions of Quebec and Ontario comprised within the old limits, that is, situated to the south of the water-shed or height of land, the forests can yield an average of 5000 feet of spruce to the acre for pulp wood, which takes in seamy trees, small head logs up to four inches diameter, even small trees three and four inches in diameter growing in wet lands and swamps. Therefore, taking 5,000 feet of wood to the acre and multiplying the yield of 1891 by ten, the extent of forest annually denuded in each province is as follows:

	Acres.
Ontario	114,914
Quebec	131,199
New Brunswick	11,371
Nova Scotia	3,334
Total	260,818

EXTENT OF SPRUCE FOREST.

If, since the date of the last census, *2,500,000 acres in New Brunswick and 300,000 in Nova Scotia have been redeemed from the forest by settlement, the present extent of the forests in those provinces would be about as follows:

	Acres.
Ontario	52,818,420
Quebec	144,363,454
New Brunswick	11,224,540
Nova Scotia	10,853,544
Total	219,259,958

TOTAL CONSUMPTION.

The exigencies of the pulp industry represent a very slight proportion of the needs that spruce is called upon to satisfy. Let us see what is required yearly for other purposes. We have already seen the quantities given by the census of 1891; let us double these quantities, let us add the quantity multiplied ten times for pulp and we get the following results, showing the quantity of spruce required yearly:

	Feet.
Ontario	4,399,417,802
Quebec	4,150,376,076
New Brunswick	1,345,261,796
Nova Scotia	1,423,788,900
Total	11,318,844,570

The area denuded yearly to get these quantities of wood and the number of years required to exhaust the present extent of the forests, are shown in the following table:

	Area Denuded Yearly. Acres.	Period of Exhaustion. Years.
Ontario	879,883	60
Quebec	830,750	173
New Brunswick	269,052	41
Nova Scotia	284,757	38
Total	2,264,342	

It is a well-known fact that when operations are carried on in a wise and provident manner, a spruce forest renews itself in fifteen or twenty years at most, especially when the soil is rich and the climate favorable as in New Brunswick and Nova Scotia. It is therefore reasonable to infer that even in those two provinces, where the forest reserve is least extensive, the spruce forests are practically inexhaustible, inasmuch as the needs of domestic consumption, of trade and the pulp industry are below the capacity of production and reproduction of these forests.

WHERE IS THE DANGER?

These considerations show beyond contradiction that the pulp industry does not constitute a threat or a danger with the preservation of our spruce forests; on the contrary, it adds greatly to the productive value of those forests. The great, the true dangers in this respect are: Fire in the first place, then the abuses committed under pretext of colonization, and wastefulness in lumbering operations.

It is hardly possible without having made a special study of the subject to form an idea of the destruction caused by fire in our forests. Take the Province of Quebec, for instance. With the proceeds of the sale of the timber destroyed by fire in its splendid forests of Lake St. John, the St. Maurice and the Ottawa, the province could pay the whole of its debt and still have several millions to spend in developing its resources. In the Saguenay and Labrador districts the ravages caused by fire have been more extensive, if not more disastrous, as regards the value of the timber.

WASTE UNDER PRETEXT OF COLONIZATION.

The pillaging of the forest under the specious and alluring pretext of colonization is a danger more to be dreaded than the pulp industry.

Of late years the value of timber has increased considerably. To take advantage of this increase a great many people—I speak more particularly of the province of Quebec—have recourse to the colonization pretext to get at the timber. This practice is especially common in the vicinity of railroads and in places where the timber can be easily got out by water. Many interloping traders who hold no timber licenses, use this pretext for securing the cut of timber which they could not otherwise obtain. In most cases they advance to the pseudo settler the necessary money to pay for his lot, taking security that all the timber will be cut for them. Notwithstanding all the efforts of the government to stop these fradulent practices, they are carried on to an extensive scale, and this explains how so much land unfit for profitable farming is every year given over to colonization.

These so-called settlers are a two-fold source of danger to the forests. In the first place, to hide their game, and give it a little color, they feign to make clearings, and for that purpose start fires which in many cases destroy considerable areas of green timber. In the second place, as their sole object is to get the wood and abandon their lots when denuded, they take only the trees that will give them the most money, wasting lots of young trees which would become valuable if allowed to grow. In the young timbers thus destroyed or wasted enough might be found to meet the requirements of the pulp industry.

Were this havoc wrought only on good lands, the practice might be tolerated, because the lots abandoned by these pillagers would be taken up again by bona fide settlers who would make farms of them. But unfortunately the quality of the soil is not considered in the selection made by these "winter harvesters," whose sole object is to get the timber, and, as in most instances the fine timber grows in mountainous regions or on lands the least fitted for cultivation, it happens that most of the lots given up to colonization are not suitable for profitable farming.

Some facts concerning the district in the vicinity of Ottawa may give an idea of this kind of colonization, the

*Paper read before the Canadian Forestry Association, Ottawa, March 7th, 1901.

*There has been cleared and put under crops 2,000,000 acres of wood lands in Ontario, 1,500,000 acres in Quebec. Divide this quantity by 260,818 acres, the extent denuded each year, and the conclusion will be arrived at that it will take this industry 840 years to exhaust our spruce forests. Province by province, the period of exhaustion would be 1,103 years for Quebec, 860 for Ontario, 987 for New Brunswick, and 3,255 for Nova Scotia.

object whereof is to make the settlers get their living out of the timber.

In 1891 there were in the county of Pontiac 440,795 acres of land occupied or taken from the Crown domain for colonization purposes, and of this quantity 138,548 acres, or about 31 per cent., were under crop. The average yield per acre of these farms was 6.31 bushels of grain, ¼ ton of hay, 1.92 bushels of potatoes, and ¼ bushels of turnips or other roots. The greater portion of the cereals consisted of oats. Estimating the cereals at 50 cents a bushel on an average, the potatoes and turnips at 25 cents, and the hay at $12 a ton, the average yield of these farms was $6.70 per acre, barely enough to cover the cost of cultivating and harvesting.

The county of Ottawa had 923,614 acres of land occupied, of which 241,443 acres, or 26.14 per cent., were under crop. These yielded on an average, per acre, 6.19 bushels of cereals, 0.37 ton of hay, 2.37 bushels of potatoes, and 0.80 bushel of other roots, of an aggregate value of $7.79. In the centre of Cure Labelle's famous colonization region—the townships of Wentworth, Montcalm, Howard, Clyde, Joly and Marchand—73,258 acres were taken up for colonization, whereof 12,091 or less than 17 per cent. were under crops. The product of these crops gave an average yield per acre of 4.13 bushels of cereals, 0.38 ton of hay, 2.62 bushels of potatoes, 0.54 bushels of other roots, of an aggregate value of $7.42.

Apart from this there were 62,210 acres in pasture in Pontiac and 103,754 in Ottawa, in all 165,964 acres. Supposing the value of products of the live stock to be equal to that of the crops, we find that the agricultural revenue of those 545,955 acres under crops and in pasture amounts to $4,036,773.

Under a well managed cutting, carried on with prudence and discernment, these lands, most of which were richly timbered, would have yielded permanently 2,500 feet per acre of merchantable timber, say a total of 1,364,887,000 feet yearly, worth $6,824,440 at the current prices of timber. The revenue derived from the timber thus exceeds that from agriculture by $2,793,667, or over 69 per cent.

These lands are nearly all situated in the Laurentian Mountains; most of them are of poor, rocky, rugged soil, on which improved implements cannot be used, and are difficult and costly to cultivate, but they were covered with the finest timber.

At the present prices for spruce saw logs, pulp wood, pine and hardwood, the timber would bring much more than the value of the crops and would entail less labor in working.

The time has perhaps come when we should consider whether, in the interest of the country, it would not be advisable to put a stop to this kind of colonization which does no good to bona fide farming and is rapidly ruining our forests. These facts, however, show only a portion of the loss suffered by the country by this stripping of the trees from land that is unfit for profitable farming. The use of agricultural produce does not extend beyond its consumption, inasmuch as it cannot supply any large industry. The products of the forest, on the contrary, possess an industrial value far beyond their intrinsic value.

We have seen that the 545,955 ares of land under cultivation could produce annually 1,364,887,500 feet of lumber, worth, in logs or in the natural state, $6,824,440. If these logs were converted into pulp or into paper they would yield 1,091,910 tons of merchantable pulp, 272,977 tons of chemical pulp and 682,443 tons of paper, taking only one-half the pulp to make paper. Calculating the cost of labor at $2.50 per ton for making one ton of mechanical pulp, at $8.00 for chemical pulp, and $3.00 for paper, we find that this lumber would, in its manufacture, give the following in wages to workmen:

1,091,910 tons of mechanical pulp at $2.50	$2,729,775
272,977 tons of chemical pulp at $8.00	2,183,816
682,443 tons of paper at $3.00	2,047,329
	$6,960,920

At an average of $1.25 per diem, this would represent the wages of 18,560 men over and above those employed in cutting the logs and driving them down the rivers. These workmen and their families would constitute a population of at least 100,000 souls, and with the additional population supported by these industrial centres we should have a total of 150,000 souls.

Who will maintain that, as regards populating the country, the settlement of infertile lands can produce equal results?

From the standpoint of national wealth the result is still more striking.

The 545,955 acres of land on which these calculations are based would yield farm produce to the value of $4,030,773. The yield of the forest would give industrial products worth ten times more. Calculating mechanical pulp at $10 a ton at the mills, chemical pulp at $30, and paper at $35, we get the following figures:

545,955 tons of mechanical pulp at $10	$ 5,459,550
136,488 tons of chemical pulp at $30	4,094,640
682,443 tons of paper at $35	23,885,505
	$33,439,695

The value of the farm produce from these lands would be $7.35 per acre. For lumbering and industrial purposes, to supply paper and pulp mills, the value of the product of these lands would be $61.25 an acre, or eight times as much. As regards increase of population it is much greater from a manufacturing than from an agricultural standpoint.

The conclusion to be drawn from all this is that the Government should give up to colonization only fertile lands that can be easily and profitably cultivated, and keep as forest reserves all that do not possess these qualities. It would be better to support at the expense of the state the unfortunately too large class of so-called settlers, who take up lots merely for the purpose of cutting the timber on them and abandon them afterwards when the forest is destroyed.

ADVANTAGES OF THE PULP INDUSTRY.

Apart from the advantages pointed out above, there are others connected with the pulp industry which deserve the consideration of all who are interested in the preservation of our forests.

In saw mills nearly all the old establishments refuse to take logs under nine or ten inches in diameter at the small end, and the portion of the trees out of which saw logs of that diameter cannot be made are left in the woods and

KENTVILLE, N.S

ost, as are also the small trees which are cut down merely or opening roads and providing places for piling logs. Finally, but little use is made of seamy or crooked trees r of those otherwise defective. Black spruce, even when f the right size for saw logs, is nearly always left aside ecause it is almost impossible to saw it into deals of niform thickness or to make merchantable lumber of it.

The pulp industry makes use of all this wood rejected s saw logs and thereby increases by at least 20 per cent. he productive value of our pulp forests. In the province f Quebec several manufacturers doing business on a large cale are beginning to understand the advantages offered y the pulp industry in this respect, and are erecting pulp ills in connection with their saw mills for the purpose of sing up the refuse stuff which has hitherto been lost.

In some saw mills on the St. Maurice a system has been dopted which also possesses great advantages. Even in he best saw logs only two or three choice deals are taken ithout making board to square the logs. The thick slabs re squared and converted into pulp wood, which is worth nore than the inferior quality boards that were formerly ade in preparing the logs for sawing into deals. By this eans they get only first quality deals and avoid the ac- ummulation of boards of inferior quality which would lut the market and affect the price of good lumber. inally, all the seamy and broken logs are turned into ulp wood as they come from the boom instead of allow- ng them to be wasted as was formerly done.

If this system were adopted everywhere the pulp industry ould be supplied with raw material in a great measure om the refuse of the saw mills, and 20 per cent. would be dded to the productive value of our forests without in ay hastening their exhaustion. It is therefore easonable to say that the pulp industry does not consti- ute a danger for our forests, and that, on the contrary, it s calculated to add greatly to their value.

WHEREIN THE DANGER LIES.

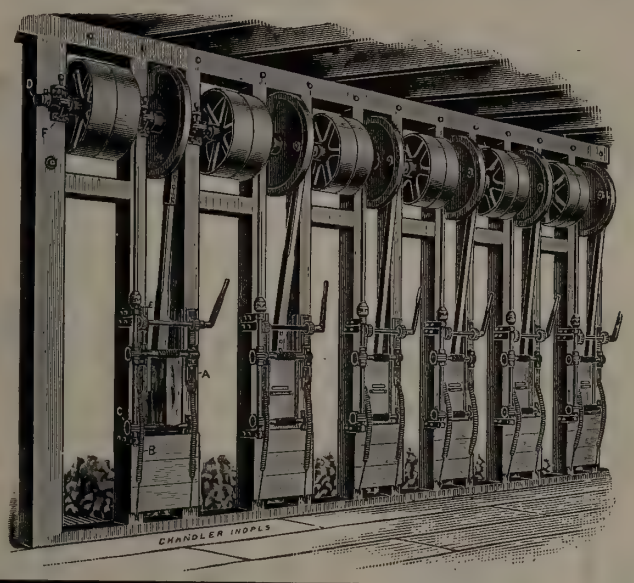
The apprehensions that have arisen in connection with his industry are due to the confusing of the cutting of mber for our own mills with the cutting of pulp wood for xportation to the United States.

The owners of Canadian mills get nearly all their timber from limits belonging to them. They are interested in preserving their forests to keep up the value of the capital invested in their mills. Take, for instance, those of the Laurentide Pulp Company, which cost from $1,500,0000 to $2,000,000 and require yearly a supply of some twenty million feet of lumber. What would the two million dollars represented by its mills, machinery, and plant be worth if the lumber were to fail? The management of this company are so alive to the danger that they have adopted a complete system with regard to cutting timber which assures its supply and infinitum. They carefully watch over the protection of their forest, and their only fear is that, under the pretext of colonization, their domain may be so encroached upon as to render it unable to supply all the lumber needed for its mills. The same applies to all the large companies having mills in this country, but is otherwise in the case of pulp wood cut for exportation to the United States.

The raising of the duty on pulp wood cut for exportation on Crown lands has brought in a host of merchants who buy timber cut on patented lands or lots belonging to individuals which are not subject to the regulations of the provincial government respecting the cutting of timber. As prices are comparatively high and purchasers take timber as small as three inches diameter, the forests are razed and not even the young trees are left for producing seed and the reproduction of the forest. This is really a devastation worse than the ravages of fire. The danger lies in this, and it is all the greater that the quantity of pulp wood cut for export is much greater than that cut for the Canadian mills.

Unfortunately, the provincial government have no way of

The Best Excelsior Machine in the World



When two or more knives are run with one belt, all must stop when the belt is stopped to set bits or from any other cause. Our Machine has a belt for each knife, hence but one knife stops at a time. This great advantage should not be overlooked by purchasers. Time is money. Our Machine cuts more excelsior in a given time than any other machine. Get our circulars and prices.

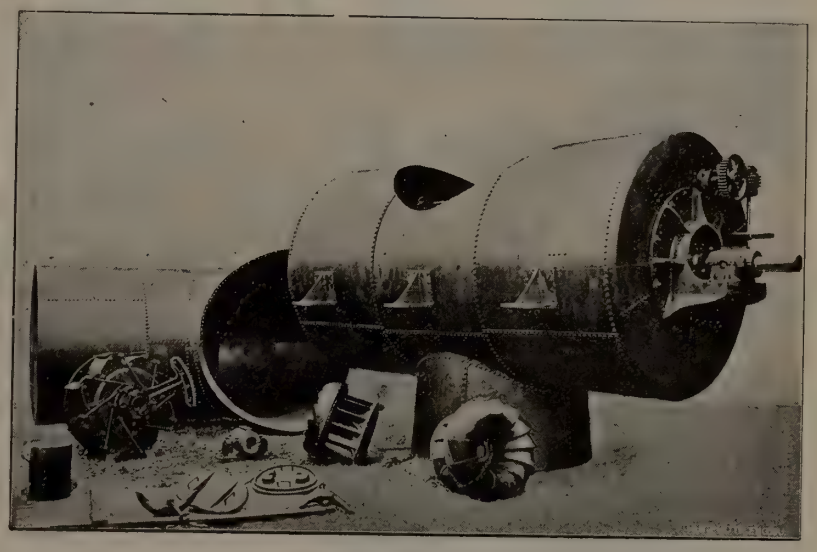
CORRESPONDENCE SOLICITED



THE above view shows one of the many styles of setting and case to which our

CROCKER PATENT TURBINE

may be adapted. This plant was built for direct connection to Wood Pulp Grinders.

We invite correspondence from those contemplating the erection of Ground Wood Mills. Estimates submitted for complete equipments.

Let us have your address and we will send you a copy of our new 1900 Turbine Catalogue, also circulars of the Port Henry Grinder, etc.

THE JENCKES MACHINE CO.
36-40 Lansdowne Street - SHERBROOKE, QUE.

controlling this cause of the ruin of our spruce forests. The only remedy would be to have an export duty imposed by the federal authorities. The wise measures taken by the provincial government will have but slight results until completed by imposition of an export duty which also affect the timber cut on lots under patent. The present state of affairs is conducive to fraud and is a source of trouble for the provincial governments. To evade the stumpage duties, lots are taken under the pretext of colonization, and all means are resorted to in order to get the patents for them so as to free the timber from the duties imposed by the provincial authorities.

Therein lies the great danger as regards the pulp industry.

PULP NOTES.

The pulp mill of the Canada Paper Company at Riviere du Loup, Que., was destroyed by fire last month.

The pulp mill to be built by a syndicate on the Knight property at Musquash, N.B., will be a sulphite mill of 60 tons capacity per day. Chas. F. Burrill, of Weymouth, N.S., is one of the promoters.

QUEBEC WOODS AND FORESTS.

From the annual report of the Commissioner of Lands, Forests and Fisheries for Quebec, it is learned that during the twelve months ended June 30th, 1900, the receipts from woods and forests were $1,112,589.52. The territory under license, 51,194 square miles, realized $170,508.71 for ground rent and annual charges, and $942,020.81 for timber dues and bonuses on current year's sale, transfer bonuses, trespass penalties and interest. The total receipts as given above do not include the proceeds of the sales of May 30th and June 26th, 1900, at which 4,903 square miles realized the sum of $394,604.11, representing an average per square mile of $80.50.

The Commissioner draws attention to the large purchases of timber lands that have been made by pulp companies, and expresses his belief that in a short time the major portion of the area purchased will be operated upon.

It is pointed out that may incipient fires were quenched in consequence of the well directed efforts, and the activity displayed by the staff of fire rangers. The service, up to the present only organized in the Ottawa and St. Maurice districts, should, in the opinion of the Commissioner, be extended to all other agencies in the province.

The following statement is given of timber cut on Crown lands during the year :

Pine logs, at $130 per thousand	223,696,252 ft. B.M.
Small pine logs, at 80 cents	67,036,637 ft.
Spruce, at 65 cents per M	308,914,039 ft.
Boom timber	48,330 ft.
White and red pine	419,831 cubic ft.
Cedar	233,300 lineal ft.
Cord wood	3,549 cords.
Birch timber	222,481 cubic ft.
Ties	388,476 pieces.
Pickets	9,835 pieces.
Pulp wood	6,926 cords.
Posts	2,177 pieces.
Rails	8,333 pieces.
Shingles	13,067 M.
Poles	854 pieces.
Spool wood	2,325 cords.

The importations of mechanical pulp into France last year amounted to 78,468 tons, as against 87,068 tons in 1899 and 92,573 tons in 1898. The import of chemical pulp shows a substantial increase last year, being 56,161 tons, as compared with 46,424 tons in 1899, and 40,479 tons in 1898.

A bill has been presented in the Quebec Legislature to incorporate the Methabetchouan Pulp Company, which is to form a part of the Consolidated Pulp & Paper Company, of Toronto. This latter company will control the pulp and paper mills at Newburg and Napanee, Ont., and the Methabetchouan mills at Lake St. John and Indian Lorette, near Quebec, about to be erected. The Lorette mills will be built on the old Reid property and will consist of two mills of 30 tons and 40 tons respectively.

R. H. SMITH CO., LIMITED

St. Catharines, Ont.

We are the Sole Manufacturers of Saws under the **Simonds' Process** in the Dominion of Canada.

There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. **All such Claims are FALSE,** as the patentee in the U. S. and ourselves are the only firms in the world who use it.

MILL STREAM, QUE., on I. C. R'y, December 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—Driving a 20 in. 13 gauge saw into frozen hardwood, using a 9 in. 4-ply belt, if it can be done satisfactorily, is a very severe test. Your saws have stood that test better than any I have tried. I have been experimenting with different makes—both home and imported—during the last five years, and give yours the preference. Last order is just to hand and will report on them by and bye.

Yours very truly, JAMES McKINLAY.

CAMPBELLTON, N.B., Nov. 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—In regard to your Shingle Saws, you can say that I have been using Shingle Saws of your make (Simonds) for the past four years, and they have given good satisfaction. I am running nine machines and use a good many saws, but have never had a saw yet that did not work satisfactorily. Before using your saws I used saws of American make, which worked well, but after giving your saw a trial have continued to use yours, as they are cheaper, and in regard to working qualities are all that is needed.

Yours truly, KILGOUR SHIVES.

CLAVERING, ONT., May 3rd, 1897.

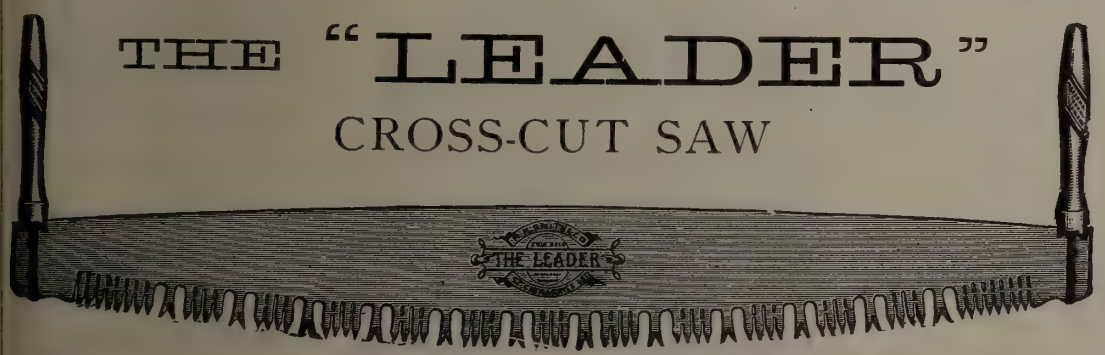
R. H. SMITH CO., LTD., St. Catharines, Ont.

GENTS,—In reply to your letter asking me how I liked the 62" SIMONDS Saw, I must say in all my experience I never had a saw stand up to its work like the one purchased from you last month. Having used saws for the last 22 years, and tried different makes, I can fully say it is the best saw I have ever had in my mill, and would recommend the SIMONDS' Process Saws to all mill men in need of circular saws.

Yours truly, W. G. SIMMIE.

P.S.—I am sending you my old saw to be repaired; please hammer to same speed as new one. W.G.S.

THE "LEADER" CROSS-CUT SAW



These Saws are made from the best DOUBLE REFINED SILVER STEEL, warranted four gauges thinner on back than front, and the only Saws on the market that are a perfect taper from the points of the teeth to the back, and require less Set than any other Cross-Cut Saw.

They are tempered by the Simonds' Patent Process, insuring a perfectly uniform temper throughout the plate, and stand without a rival as the BEST, FASTEST, AND EASIEST-CUTTING SAW KNOWN. A gauge to regulate the clearing teeth is furnished with each saw.

Directions for Setting and Filing are plainly Etched on every Saw. None genuine without our Registered Trade Mark as shown in cut.

THE "LEADER" SAW SWAGE

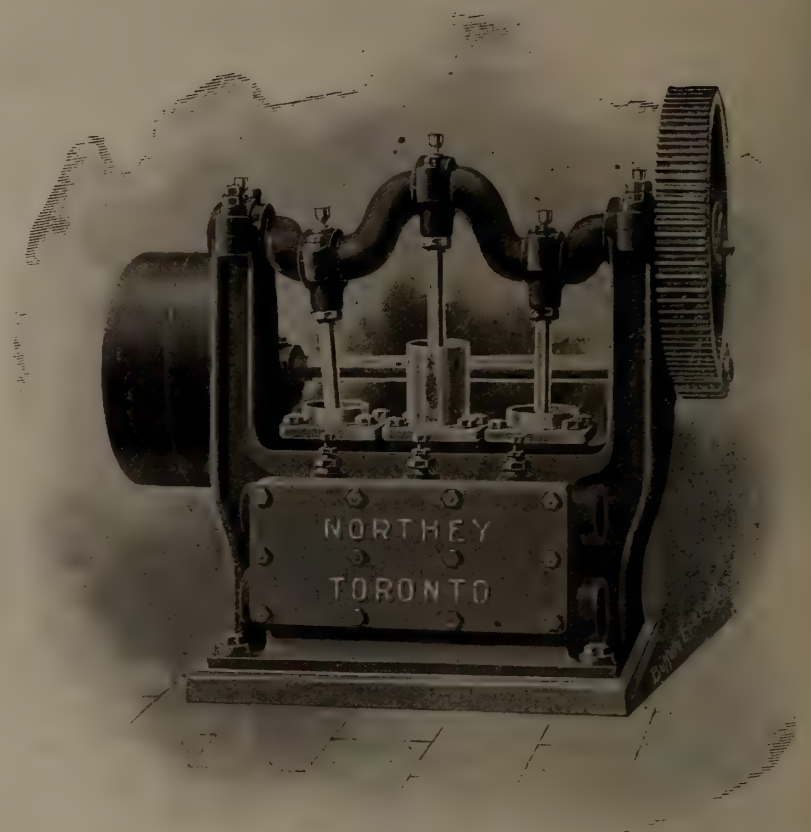
Northey Triplex Power Pump

FOR BOILER FEEDING AND GENERAL PRESSURE PURPOSES

In the Northey Triplex Power Pump we offer a machine put together with the skill brought by years of experience in pump building, and with full provision made for the varied demands likely to be made upon a pump of this character. A feature of value is that the three cranks are placed 120 degrees apart, thus giving a practically constant flow of water—minimizing strain on pump and economizing power. The pump can be readily repacked and taken up, and all details are carefully worked out. It can be conveniently operated by electricity, by water power, or by belt from engine. Different styles and sizes made to suit all duties.



WE ARE MANUFACTURERS OF OVER FIVE HUNDRED DIFFERENT STYLES AND VARIETIES OF STEAM AND POWER PUMPS FOR STATIONARY AND MARINE PURPOSES. WE INVITE ENQUIRIES FROM ENGINEERS, MINE SUPERINTENDENTS AND OTHERS FOR THEIR REQUIREMENTS IN OUR LINE. CATALOGUES AND SPECIFICATIONS FURNISHED UPON REQUEST.

We are also manufacturers of the Northey Gas and Gasoline Engine which has proved to be the handiest and most convenient power for small or intermittent power users in the market. Suitable for machine shops, pumping and electric light plants, etc. Write for illustrated descriptive booklet.

VOLUME XXI. NUMBER 5. | TORONTO, CANADA, MAY, 1901 | TERMS, $1.00 PER YEAR Single Copies, 10 Cents

THE VICTORIA LUMBER AND MANUFACTURING COMPANY.

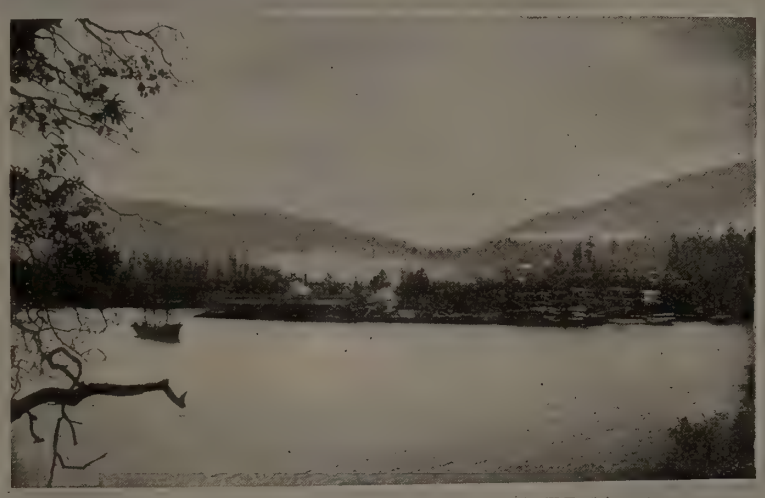
Located at Chemainus, in British Columbia, is one of the largest and most modern saw mills on the Pacific coast, the property of the Victoria Lumber and Manufacturing Company. The town is about fifty miles from Victoria, on the east side of Vancouver Island. It is situated on Horseshoe Bay, which is sheltered by Bare Point, making a perfect harbour, where ships of all sizes may load with perfect safety. Harbor views are presented on this page, and on the following page are shown some scenes in connection with the Victoria Lumber and Manufacturing Company's lumbering operations.

The present saw mill was built in 1890, but the full complement of machinery was not installed until later. The main mill is 450 feet long by 74 feet wide, and the boiler house, a stone structure, is 64 feet long by 64 feet wide. The motive power is supplied by two 24x30 slide valve engines and one 22x28 twin engine, while a 15x22 upright engine is used for driving the dynamo, the company supplying their own electric light. Steam is supplied by four tubular boilers 66 inches by 16 feet, and four two flue boilers 56 inches by 24 feet. Fuel used is sawdust and refuse, fed automatically.

In the mill proper are two band saws, a Wickes' gang, two gang edgers, two gang slashers, and one patent trimmer. One side of the mill is equipped with a Hill steam nigger, and the other with a Simonson steam log turner. From the time the log is pushed onto the saddle on the log haul-up, until the lumber lands on the extensive docks, which surround the plant, the lumber is all handled by machinery, flippers, transfer chains, etc., being strongly in evidence. The log haul-up is an endless chain, fitted with rigid saddles, which carries the log up on to the deck, from which it is thrown by steam flippers to either side of the mill, as required. The mill can cut timbers up to 130 feet in length, and is especially adapted for the handling of large and long timbers. Besides the main mill, is a well equipped machine shop, lath mill, blacksmith shop, and planing plant.

The lumber cut is mainly Douglas fir, commonly known as Oregon pine, although a certain amount of cedar and spruce, to meet the local demand, is also cut. The output, at present, is largely shipped to foreign markets, and consists of deals, flitches and timbers, with a certain percentage of decking, selects and flooring. The Esquimalt & Nanaimo Railway runs within a short distance of the plant, and, as the C. P. R. is reported as intending to install a ferry system, connecting the E. & N. Railway with their line, no doubt it will not be long until the Chemainus Company is shipping to eastern markets.

CHEMAINUS LOOKING OUT TO HARBOR ENTRANCE



CHEMAINUS FROM HARBOR ENTRANCE

Fire protection is afforded by the company's own water-works system, in conjunction with two large steam pumps and their private hose.

About two hundred men are employed in and about the mill, and from forty to sixty in loading the vessels.

The company operate their own logging camps, which are situated about six miles from salt water, immediately back of Chemainus. The logs are all hauled to the boom in front of the mill over the company's own railroad, which is a standard guage, well ballasted road. In the woods the company employ from 100 to 150 men. The logging plant consists of ten donkey engines, one Climax geared locomotive, two direct connected locomotives, and a large number of logging cars. This plant when working full is capable of putting in 250,000 feet of logs per day. The company own their own timber lands, and supply all the logs used in their mill.

The officers of the company are: J. A. Humbird, president; R. P. Rithet, vice-president; T. J. Humbird, treasurer; W. H. Phipps, secretary; E. J. Palmer, manager. Messrs. R. P. Rithet & Co., Victoria, B. C., are selling agents for the company.

TESTS OF TIMBER.

According to tests of timber made by Professor Henry T. Bovey, of McGill University, Montreal, spruce failed by compression at 9,000 pounds, tamarac at 11,000 pounds, and British Columbia fir at 14,000 pounds. H. J. Gamble, division engineer of the Canadian Pacific Railroad, located at Vancouver, B. C., writes: "In bridges exposed to the weather fir lasts in this wet climate about ten years, and in the dry interior of the province, a few years longer. I would also state generally that it is very strong and excellent timber for bridges, trestles of buildings, joists, etc., and when cut 'edge grained' makes as fine a flooring as can be desired."

LUMBER DAMS.

In a report to the Commissioner of Crown Lands, Mr. G. W. Bartlett, superintendent of the Algonquin National Park, calls attention to the destruction of timber around the lake shores by water. He says: "It is very much to be regretted that so many of the lakes in the park are being damaged by having the water kept up too long in the spring, thereby killing the timber around the lake shores. Dams must be built, it is true, but I think each spring the limit holders should be notified, as they were last spring, to let off the water as early in the season as possible."

The annual meeting of the St. John Log Driving Company was held at Fredericton, N.B., on April 3rd. Reports were presented, and the affairs of the company stated to be very satisfactory. The following directors were elected: W. H. Murray, A. H. F. Randolph, R.A. Estey, D. Fraser, jr., and F. H. Hale. W. H. Murray was elected president and J. Fraser Gregory secretary-treasurer. The contract for steam driving from Grand Falls to the boom limits was awarded for a term of four years to J. A. Morrison and Robt. Nobles, at 30 per cent. off the upset. The contract price per thousand is 14 cents from Grand Falls to the boom, and 11 1-5 cents from Tobique to the boom.

ONTARIO FORESTS.

The annual report of the Commissioner of Crown Lands of Ontario for the year 1900 states that the revenue from woods and forests during the year was $1,276,376.48. Of this $636,464.54 was on account of bonuses, $61,704.70 on account of ground rents, and $1,886.25 on account of transfer fees, leaving the net revenue from timber dues $576,320.99. The prosperous condition of the lumber business and the success of the manufacturing clause affecting pine saw logs is referred to.

The activity in the demands for woods suitable for the making of pulp and paper, the report states, has been undiminished. The Sault Ste. Marie Pulp and Paper Company have operated their mechanical pulp mill continuously throughout the year, and have also erected a sulphite mill of large capacity. Work at the Sturgeon Falls mill has been suspended through litigation respecting this property. Since the last report three new agreements have been entered into by the Government and ratified by the Legislature for the erection of paper and pulp mills, namely, with the Spanish River Pnlp and Paper Company, the Blanche River Pulp and Paper Company, and the Nepigon Pulp and Paper Company. The Spanish River company have prepared elaborate plans for the establishment of their industry, and are proceeding with the erection of dams, mills, etc. The other two companies, namely, the Blanche River and the Nepigon, have not yet succeeded in settling matters in connection with the water powers for their proposed mills.

The explorations in the country north of the height of land have revealed the fact that this province has almost boundless resources in pulp woods, and with the higher prices and greater demand for this class of raw material, we may confidently look for a great expansion in the pulp and paper industry in the not distant future.

Regulations have been passed prohibiting the export of spruce pulp wood cut on lands of the Crown, as well as of hemlock bark to be used for tanning purposes, the object being, as in the case of pine sawlogs, to realize for the province all the benefits arising from the utilization of these natural resources in our own country.

FIRE RANGING.

The following reference is made to the fire ranging system as now in vogue :

The number of licensees who had firerangers on their limits last season was 79, and the number of rangers employed on licensed lands was 185. There were also 12 rangers employed on Crown lands in the Temagaming country (which is a favorite resort for tourists) and in the Wahnapitae country and the district of Rainy River, where prospectors have gone in. The total cost of the service to the Department was $26,985.43.

In the Ottawa country and in the districts of Muskoka, Parry Sound and Nipissing, the season was comparatively wet and there were no large fires. In the districts of Algoma, Thunder Bay and Rainy River, however, the summer was a particularly dry one, and some serious fires occurred, especially on limits in Algoma and Rainy River. In the township of Dana, on the Sturgeon River, owned by the Crown, a fire broke out in June. The Department's rangers from Temagaming hurried to the scene and succeeded in confining the fire to some lots in the first concession. A good deal of timber was damaged, and after inspection by woodrangers of the Department it was decided to dispose of the timber standing on lots 1 to 5 in the first concession, so that its value might be realized to the Province.

At the last session of the Legislature the fireranging system was put upon a statutory basis, and whereas in the past the employment of firerangers was merely optional on the part of limit owners, the Department has now authority to place men on licensed territory where there may be danger from fire, and charge half the cost of the same to the lumberman. This was undoubtedly a proper step, as it was manifestly unfair that a licensee who had protected his limits year after year by the employment of rangers should be exposed to loss from fire running over from the limit of his neighbor who employed no rangers.

It has been the practice of the Department to keep close watch on the fireranging system, in order to see that it is being properly carried out, and to strengthen it from time to time where it may be weak. In order to get definite information upon the working of the system, it has been customary every two or three years to send out a circular to all those licensees who have employed firerangers, asking them a series of questions as to the working of the system, and what suggestions they have to offer in the direction of improving it. This year circulars were sent out to those licensees who have employed firerangers during last summer, and replies have been

LUMBER SCENES—VICTORIA LUMBER AND MANUFACTURING COMPANY, CHEMAINUS, B.C

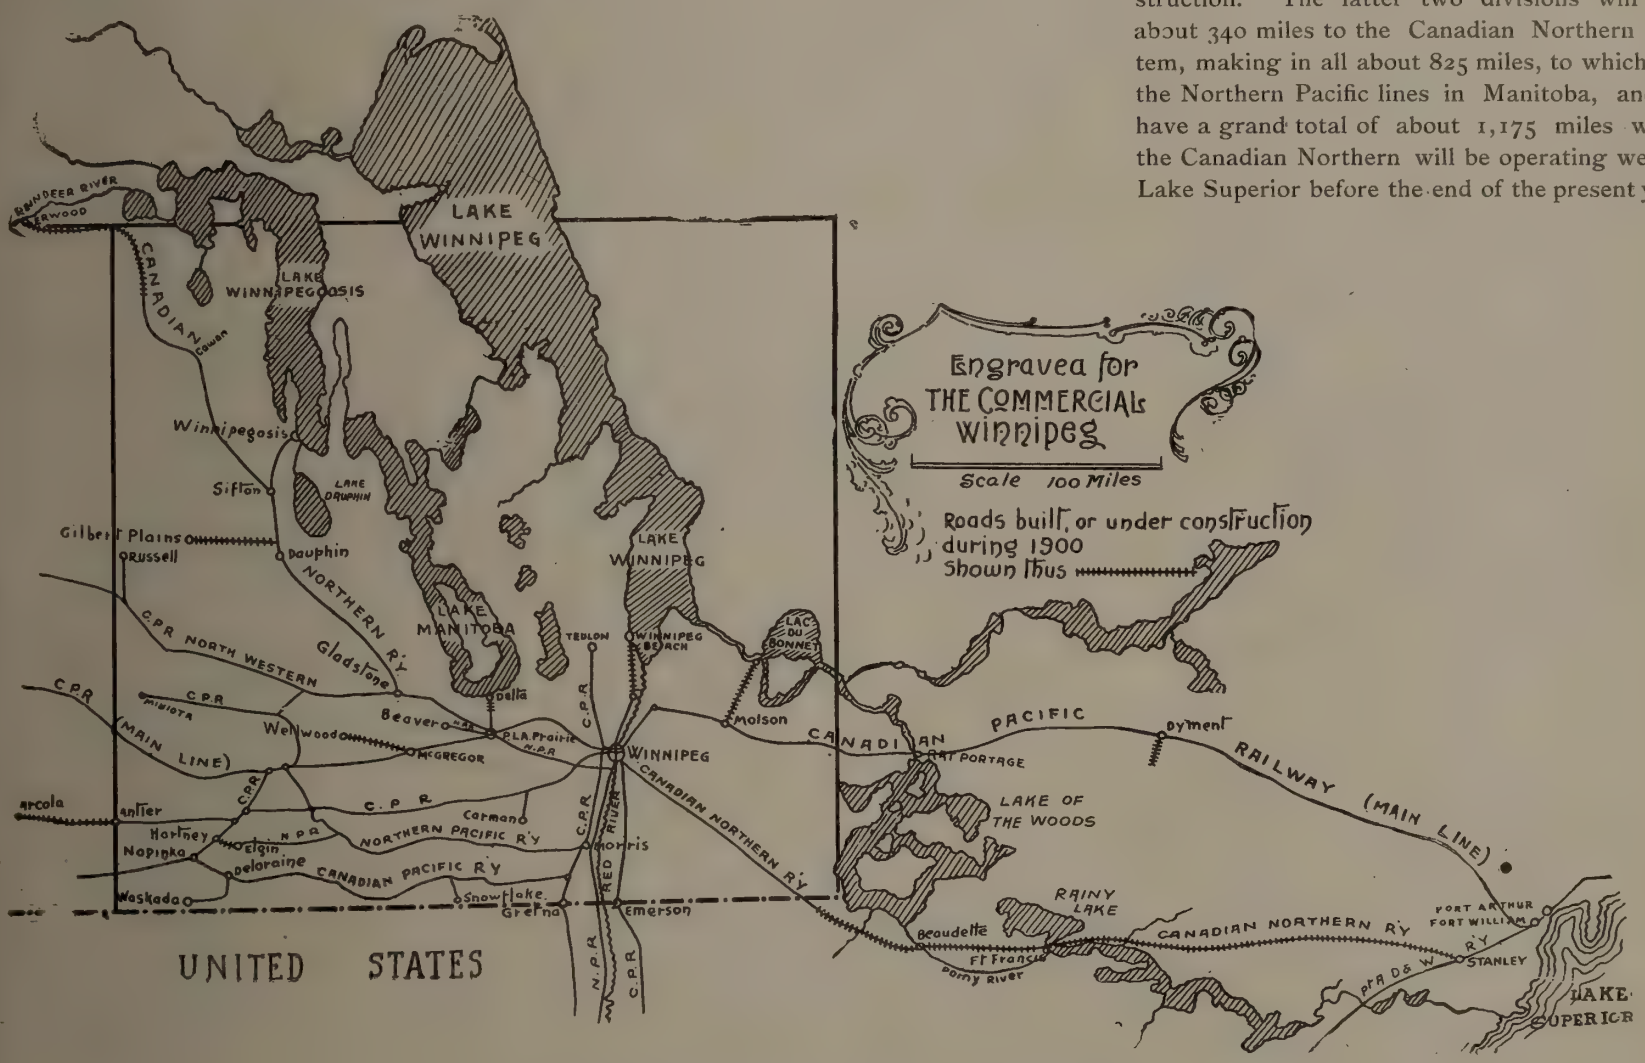
received, and from these it appears that there were about ninety fires extinguished by the different fire rangers before they got much headway, which, if there had not been firerangers on duty, would no doubt have spread and destroyed large quantities of timber. The licensees all expressed themselves as satisfied with the management of the service, and in only one or two instances out of the whole number employing rangers were any suggestions made, and they were all in the direction of increasing the number of fire rangers and making more severe the penalties for setting out fire or leaving it burning in the bush during the dangerous period. It has been suggested that the forest rangers of the Crown should be kept on duty during the whole summer, and have supervision of the firerangers. Perhaps the service would be benefitted by a closer inspection, but without an increase of the vote for forest ranging it is not possible to keep the rangers on duty longer than is required to supervise the cutting operations in the winter and collect the sworn returns of the same.

Following is a statement of timber taken from Crown lands during the year ending December 31st, 1900 :

Area under license	16,732 acres.
Pine saw logs	643,510,766 ft. B.M.
Other saw logs	36,721,998 ft. B.M.
Pine, boom and dimension timber	34,724,488 ft. B.M.
Other dimension timber	6,866,900 ft. B.M.
Square white pine	1,919,230 cubic ft.
Birch timber	2,380 cubic ft.
Ash timber	555 cubic ft.
Pile timber	524,387 ft. B.M.
Cedar	135,008 lineal ft.
Cordwood	29,184 cords.
Tanbark	1,253 cords.
Railway ties	1,143,374 pieces.
Posts	5,309 cords.
Telegraph poles	9,784 pieces.
Shingle bolts	1,145 cords.
Head blocks	164 pieces.
Pulp wood	65,051 cords.
Traverses	148 pieces.
Stave bolts	5,559 pieces.

THE RAILWAY SYSTEMS OF MANITOBA.

In view of the relation which the transportation problem bears to the lumber supply of Manitoba, and of the proposal of the Canadian Northern Railway to assume control of the Northern Pacific lines in that province, the accompanying map will be of interest to many of our readers. The map, for which we are indebted to the Winnipeg Commercial, shows the new Canadian Northern system up to date ; also the Northern Pacific lines in Manitoba, which may come under the control of the Canadian Northern. The cross-sectioned lines show railway built or under construction last year. The Canadian Northern system includes the Port Arthur, Duluth and Western railway, and the Ontario and southeastern section extending from Port Arthur to Winnipeg. A section of about 145 miles, extending eastward from Beaudette, where the latter line crosses the Rainy river, under construction, will make the line complete between Winnipeg and Lake Superior. This is also the northern section of the Canadian Northern systems, extending from Gladstone, in Manitoba, northerly to Erwood, in Saskatchewan territory. By building a short new line from Gladstone to Beaver, the western terminus of the Northern Pacific Portage la Prairie branch, the Canadian Northern will have a through line from Erwood, west of the extreme north-western corner of Manitoba, to Lake Superior. There are two branches connecting with the northern section of the line in Manitoba—the Winnipegosis and Gilbert Plains branches. The Northern Pacific lines in Manitoba proposed to be acquired by the Canadian Northern, are as follows : Winnipeg south to the United States boundary, Portage branch from Winnipeg to Beaver, Lake Manitoba branch from Portage la Prairie to Delta, and the line from Morris to Brandon, with a branch from the latter line to Hartney. The Northern Pacific lines in all aggregate 351 miles, as follows : Winnipeg to boundary, 65 miles ; Portage branch, 74 miles ; lake branch, 16 miles ; Morris-Brandon branch, 145 miles ; Hartney branch, 51 miles. The Canndian Northern lines are as follows : Northern section, Gladstone to Erwood, 279 miles ; Gilbert Plains branch, 29 miles ; Winnipegosis branch, 21 miles ; Southeastern section, Winnipeg to Beaudette (Rainy River), 155 miles. Total, 484 miles. This does not include the Port Arthur, Duluth and Western, nor the Ontario section east of Rainy River (Beaudette), part completed and part under construction. The latter two divisions will add about 340 miles to the Canadian Northern system, making in all about 825 miles, to which add the Northern Pacific lines in Manitoba, and we have a grand total of about 1,175 miles which the Canadian Northern will be operating west of Lake Superior before the end of the present year, not allowing for new branches which they may build this year. They will have to extend the Morris-Brandon branch eastward at once to connect with the line to Lake Superior, in order to give this branch an outlet, and the connection between the Beaver and Gladstone will no doubt also be made at once. Other new branches are projected. The Canadian Northern therefore becomes one of the great railway corporations of the continent, with the prospect that it will ultimately travense the Saskatchewan valley and beyond to the Pacific coast.



RAILWAY MAP OF MANITOBA AND NORTH-WESTERN ONTARIO.

The government agent for Canada in Belgium writes to the Canadian Manufacturers' Association that there is an opening in that country for a large trade in both axes and ax handles. He suggests that a sample room for various lines of Canadian goods should be opened, and is confident that the results would prove very satisfactory to the manufacturers.

One Copy, Weekly and Monthly, Six Months, in advance..... .50
Foreign Subscriptions, $2.00 a Year.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in anyway affecting it. Even when we may not be able to agree with the writers, we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

LUMBER AND RAILWAY MATTERS IN MANITOBA.

IT is almost beyond doubt that no import duty will be placed on United States lumber at the present session of the Dominion Parliament. The consumers of Manitoba and the Territories will be permitted for another year at least to import lumber from Minnesota without being called upon to contribute to the funds of the Dominion treasury. A circumstance has arisen, however, which, although not meeting the requirements of the entire Dominion, seems likely to give a measure of relief to Canadian lumber manufacturers, who are rightly entitled to the Manitoba market. This is the probable control by the Canadian Northern Railway of the lines in Manitoba now operated by the Northern Pacific Railway.

An agreement to that effect has been arranged between the owners of the Canadian Northern Railway and the Manitoba Government, but up to the time of writing the agreement has not been ratified by the Dominion Government. There are, as might be expected, opponents to the proposed contract, and probably justly so. As a lumber journal, we are not particularly concerned with the political aspect of the contract, but only in so far as it is likely to affect the lumber interests of Canada.

The lack of railway accommodation has in the past been a great drawback to Manitoba. Some points were reached only by the Northern Pacific Railway. Consequently, the freight rates were so manipulated by this road as to almost entirely shut out Canadian lumber from these points. The freight rate on lumber from the principal saw mills in Minnesota to all points on the Canadian Pacific Railway in Manitoba has been 16 cents per 100 pounds, this being a flat rate to all points. The Northern Pacific Railway have refused to carry lumber produced on other railway lines than their own except at local rates. These rates were almost as high for a short haul as the long haul rates from Minnesota points. For example, on lumber carried from Winnipeg to Mariapolis, a point 119 miles west of Winnipeg, the rate is 14 cents, or just 2 cents less than the rate from Little Falls, Minn., to Brandon or Hartney, a distance of nearly 500 miles. The Northern Pacific rate from Winnipeg to Roundthwaite, a distance of 170 miles, for lumber produced by Canadian manufacturers, is 16 cents per hundred, while the same rate is charged for a haul of about 500 miles for lumber manufactured along their own line of railway.

The Canadian pine lumber being practically all produced east of Winnipeg, must bear a freight to Winnipeg, which, together with the local rate charged by the Northern Pacific Railway, excludes almost entirely all lumber produced in Canada from the markets on the Northern Pacific Railway system in Manitoba.

Should the Canadian Northern Railway Company take over the lines of the Northern Pacific Railway, which now seems probable, and operate them in connection with their line nearing completion from Port Arthur to Winnipeg, a rate will no doubt be given as low, if not lower, from the mills on the Lake of the Woods and along their line of railway as the rates which now obtain from the lumber centres of Minnesota to all points in Manitoba reached by the Northern Pacific Railway. This will have the effect of opening up a market in Manitoba for Canadian lumber which Canadian manufacturers heretofore could not reach, for the above stated reasons. Such an arrangement as is proposed would not be likely to shut out the American product entirely, but would doubtless decrease materially the quantity imported.

The system of the Canadian Northern Railway from Port Arthur to Winnipeg, which is expected to be completed this summer, passes directly through the principal pine territory from which the west is supplied, touching the Lake of the Woods and crossing Rainy River, the outlet to Rainy Lake, and again crossing Rainy Lake, to which water all tributaries from Northern Minnesota and the many tributaries from the pine forests of Western Ontario flow. Being the shortest and most direct system of railway to the prairie country, it should be of great benefit to the lumber consumers of Manitoba, as well as serving, by means of competition, to lower the freight rates charged to the west. Instead of being a disadvantage to the farmers and other users of lumber, as some contend, we believe the proposed railway agreement would have the ultimate effect of lowering the price of lumber to consumers.

THE PREFERENTIAL TARIFF AND TRANSPORTATION.

The preference of 33⅓ per cent. which is granted by the Canadian tariff to British manufactured goods entering Canada, appears not likely to benefit British manufacturers to any considerable extent. The reason is that United States manufacturers, in their determination to maintain their hold on the Canadian market, are cutting the prices of their goods to Canadian buyers to the extent necessary to enable them to undersell the British manufacturer, notwithstanding the advantage which the latter enjoys under our tariff. In order to do this, United States manufacturers are selling their goods in Canada at prices much below those charged to their customers in the home market. The only person, therefore, who is being benefited by the preferential tariff is the Canadian consumer.

Discrimination in railway freight rates also enables United States manufacturers to undersell Canadian manufacturers in their own market. As an illustration, we may take the case of corrugated iron. Every sheet of this material used by Canadian manufacturers must be brought into this country from the United States. Most of the material comes from Pittsburg. We find that the Pittsburg mills are selling the finished product to the customers of the Canadian manufacturers to whom they supply the sheets. On account of lower freight charges, the Pittsburg mills are able to ship the manufactured material to British Columbia, pay 25 per cent. duty, and undersell the Canadian manufacturer in that market. They can lay the finished product down at $1.00 per 100 lbs. plus the duty, while it costs the Canadian manufacturer $1.48. The Canadian Pacific Railway Company claim that they cannot meet the rates granted by the American roads, although their freight carrying facilities are not fully taxed. Surely it would be better for them to carry Canadian goods at a small profit and thereby help on the Canadian manufacturer, than allow his trade to go to the United States manufacturer and the goods to be entirely carried by American roads.

It will be seen that the tariff question has become one of the greatest importance in Canada. Some means of regulating rates and conditions are needed. Whether the proposal of the government to appoint a railway commission would effect the object in the most satisfactory manner is a difficult question to determine, and one which would largely depend on the powers and privileges granted to the railways by their charters. If such a commission is appointed, it should be entirely beyond political influence, and should be so constituted that the character of its administration would be continuous, giving opportunity for the members to become thoroughly familiar with the questions with which they would be called upon to deal.

The proposition has been brought before the Canadian Manufacturers' Association that the preference should only apply to British goods brought into Canada through Canadian ports. This proposition has in view the laudable object of building up Canadian seaports, but there are other phases of the question which are equally important and which must be taken into consideration. If Canadian manufacturers are to successfully compete with those of the United States for foreign trade, they must enjoy equal shipping facilities. It is evident that we can only bring to Canadian ports as many ships as we can supply with cargoes, and that the frequency of their arrival and departure must also depend upon the volume of shipments. With

a population less than one-twelfth that of the United States, and with seaports much less advantageously situated, we cannot hope to be able to give our shippers for export as good facilities as they now enjoy by the use of American ports. Under the bonding privileges which now exist, they are placed on equal footing with the shippers of the United States, while if they were compelled to use Canadian ports, they would be subject to delays which would make it impossible for them to compete.

EDITORIAL NOTES.

IF you have carried over any lumber, remember that it will be greatly preserved by re-piling. It will cost a little, but will be economy in the end.

WOULD the present season not be an opportune time to visit Great Britain, take in the Glasgow exhibition, and do a little missionary work towards forming a connection with Britsih timber importers and consumers? Last year the United Kingdom inported timber to the value of $125,000,000. A greater share of this trade may be yours for the seeking.

THE lumber shippers of St. John, N.B., have encountered a labor strike, although not of serious proportions. The surveyors who tally the lumber loaded on the vessels formed an association a short time ago, and after getting in working order asked for an increase in the fees paid for the duties performed by them. This increase was paid by one or two of the shippers and refused by the others, but at time of writing a settlement seems to be in sight. The lumber trade has for some time been singularly free from labor disturbances, and the outlook at the opening of the sawing season is that the friendly relations will continue to exist between employers and employees. The scale of wages is materially higher than a few years ago when strikes were more common, and it should be said in justice to the men that they apparently recognize the betterment of their position.

THE recent outbreak of small-pox has called attention to the question of the sanitary condition of lumber camps, and government inspection has been suggested. Without advocating the necessity or otherwise of such inspection, it may safely be stated that the employing lumbermen would place no obstacles in the way of the enforcement of proper measures for the prevention of the spread of this disease, even if an official inspection should be necessary. Voluntarily, the sanitary condition of the lumber camps has been greatly improved in late years, notwithstanding the statements of newspapers of the filthiness which exists in some quarters. A radical change in the personal habits and general sanitary conditions has taken place, but is no doubt capable of being carried still further. In some of the lumber camps laundries have been established, by means of which the clothing of the men is washed and mended.

IN lumber shipping circles considerable agitation has been shown on account of the proposition of Hon. R. R. Dobell to again introduce in the Dominion Parliament legislation providing for government inspection of deck loads of lumber. The main objections have come from the Maritime provinces, where it is claimed that such a law would be inimical to the interests of lumber shippers, that it has not been asked for by the British Underwriters, and that it would cause unnecessary expense and delay. These objections have been answered by Mr. Dobell, who points out that at a meeting of the London Chamber of Commerce the Underwriters stated that they had been led to increase their rates of insurance on vessels trading to British North America owing to the loss of deck loads. The charge for inspection, he contends, would range from $5 to $10 per vessel, which would not be a serious handicap when it is considered that the average freight on a vessel carrying 375 standards of deals would be $750. There would be no delay in the sailing of vessels, as if an inspector were not on hand when the steamer had finished loading, the captain would be justified in sailing without inspection. Any slight disadvantage which might result from the necessity of such inspection would, in Mr. Dobell's opinion, be more than offset by the improbability of accident by having the decks overloaded. An illustration which bears directly on the case was furnished at St. John early in April, when a vessel bound for London with lumber and pulp was unable to make any progress and would neither steam nor steer owing to her being almost over on her beam ends. After getting a short distance out, tugs were dispatched for the purpose of relieving the vessel of some of her deck load. The consequent delay and expense would probably have been obviated by compulsory inspection. It is understood that the Minister of Marine and Fisheries has decided not to include in his bill at this season anything relative to the inspection of deck loads, but it is improbable that the matter will be allowed to drop.

QUESTIONS AND ANSWERS.

"R. W. R.," Liverpool, writes: I shall be much obliged if you will give me the names of a few of the largest exporters to Liverpool of hard and soft wood handles for tools, and such like Canadian goods ready for use.

ANS.—There are, in Canada, a number of manufacturers and exporters of turned wooden goods, of whom the following might be mentioned: Alexandria Export Co., Alexandria, Ont.; Canada Wood Specialty Co., Orillia, Ont.; Ker & Harcourt, Parry Sound, Ont.; Dominion Paper Co., Kingsey Falls, Quebec; Colin Reid, Bothwell, Ont.; Lachute Shuttle Co., Lachute Mills, Que.; Blyth Handle & Turning Works, Blyth, Ont.; Gillies Bros., Braeside, Ont.; Cameron, Dunn & Co., Strathroy, Ont.

Dr. Young, Adolphustown, Ont., asks: "Can you give me the names and addresses of individuals and firms in Ontario who sell, wholesale, stock for apple barrels, such as staves, hoops, and heading?"

ANS.—Sutherland, Innes Co., Chatham; Steinhoff & Gordon, Wallaceburg; Rathbun Co., Deseronto; Fred Deutschmann, Teeswater; W. R. Thompson, Teeswater; J. Vance, Hepworth Station, and others.

The Georgian Bay Shook Mills, Limited, capital $40,000, has been incorporated, to take over the business of the Georgian Bay Box Company at Midland, Ont. P. Potvin, R. B. Little, and William Finlayson are the promoters.

DISCOLORATION IN CEDAR.

The discoloration in red cedar shingles has caused much protest recently from dealers to manufacturers. The complaint has been based on the ground that the discoloration was the beginning of rot, and that these shingles had been cut from trees with hollow butts or from timber that had been down for a number of years and which had been subject to decay in the action of the element. It may surprise the retailers who have been handling the beautiful, clear cedar siding that comes from the west coast, to be told that nearly all the stock is cut from hollow butted trees. Should any one of these retailers visit the forests of great coast cedars, he might wonder that any sound cedar lumber could be manufactured, for a very large proportion of the large cedar trees have butts that are hollow many feet above the ground; and yet the shell of the butt and the part of the tree above the hollow are as sound as any timber that grows. The belief that the shingles are cut from fallen trees may also be true; in fact, it is quite likely to be true; but the deduction therefrom that the shingles are any less sound is equally unwarranted. It is a peculiarity of the red cedars that the soundness of the wood is maintained hundreds of years after the life of tree is extinct. Scattered through the forests of Washington are hundreds of cedar trees that fell ages ago and which are covered with moss and decaying vegetation. When the outside shell is removed, the interior of the tree is found to be as sound as when the tree was standing. That these trees have been down for centuries is proven by the fact that other trees hundreds of years of age have grown up over them. The streaks of discoloration of which the shingle buyer complains are not an indication of decay. The belief that it is probably comes from a comparison with white pine. In fine dark streaks are more than likely to be rot; but it is a peculiarity of red cedar, as well as a number of other woods, that these dark streaks are as likely to be found in sapling growth as they are in mature hollow-butted trees. These complaints have become so common where the warrant for them is so slight that reputable firms have added to their price list a statement that objections to shingles because of discoloration will not be considered. This is done simply as a protection from the injustice of complaints that are without warrants, and retailers who find occasional shingles not entirely bright can be assured that the chances are that the stocks of discolored wood are as sound as the remainder of the shingle. As a matter of fact, few, if any, shingle men are expert enough to tell, after a shingle has been through the kiln, whether it was cut from a live tree or from one that has been lying prone for ages.—The Tradesman.

PACIFIC COAST SAW MILLS.

Mr. L. W. Knight contributed a paper at the twenty-fifth annual meeting of the Pacific Insurance Association, in which he states that on the Pacific coast, including British Columbia, there are 3,298 establishments engaged in the manufacture and sale of lumber and lumber products. In British Columbia there are 97 saw and shingle mills, 11 planing mills and box factories, 17 sash and door factories, 42 log and bolt camps, and 34 retail yards.

FORESTRY IN BRITISH COLUMBIA.*

By J. R. ANDERSON.

AT the present time British Columbia probably possesses within its limits larger unbroken areas of primeval forest than any other country in the world, and is destined in the near future to be the principal source of supply of timber and wood pulp. Hence the question arises how best to conserve our forest wealth to the best advantage and for the greatest good.

British Columbia, it must be premised, is a province of vast extent, extending as it does from the forty-ninth degree of latitude on its southern boundary, to the sixtieth degree on its northern boundary, bounded on the west by the Pacific ocean and on the east by the 120 degree of longitude and the Rocky mountains.

The climatic conditions within this great area, owing to natural causes, it can easily be imagined, are most variable and calculated to suit the requirements of many different kinds of forest trees. Amongst the most prominent of them I make mention of the following. And here I may explain that the descriptions are largely quotations from a report I made some years ago, at the request of the Admiralty, and will serve, to some extent, to give an dea of the forestry resources of British Columbia. I reproduce my remarks with all diffidence, and subject to correction, as I am quite aware of my liability to err in statements involving interests of such magnitude.

Without doubt the timber of greatest economic value in the province, and of which there is the greatest quantity, and most generally distributed, is the Douglas Fir, sometimes called Red Fir and Oregon Pine; it is now known under the botanical name of Pseudotsuga Douglasii—Carr.

The synonyms are :

Pinus taxifolia—Lamb.
Abies Douglasii—Lindl.
Abies mucronata—Raf.
Pinus Douglasii—Lamb.
Abies Douglasii—Gordon.
(var taxifolia)

Its range may be said to practically extend to the whole of the province with the exception of the Queen Charlotte Islands, where it is said it does not grow, and it accommodates itself to all altitudes from sea level to 6,000 feet; at great altitudes, however, it only grows in a very stunted form. Dawson says: "The best grown specimens are found near the coast, in proximity to the waters of the many bays and inlets which indent it. Here the tree frequently surpasses eight feet in diameter, at a considerable height above the ground, and reaches a height of from 200 to 300 feet, forming prodigious and dark forests." My own experience is that Dawson is quite right in his remarks, and therefore it will readily be seen that the shipping facilities are exceptionally good for the best qualities of this useful timber. Amongst the uses it is put to I may mention house building, ship building, bridging, wharves, piles, masts, furniture, fencing, etc. When growing singly in the open it forms a very beautiful and useful shade tree, the branches starting from near the ground and growing out very thickly all along the stem. It is, however, practically useless for commercial purposes when growing in this form, and it is only useful when growing thickly together in dense forests. In the latter state it grows without branches except at the top and so yields timber of immense size and length, without knots, particularly suited for bridging and similar works. In this country it is not particularly liable to attacks of insects and dry rot, except when immersed in the sea, where it (in common with most of the other woods of the country) is subject to the attacks of the Pennulifera teredo. When submerged or buried under ground, away from the influence of the air, it is very durable and will in these positions last for many years; it soon rots, however, if left lying on the ground exposed to damp. The usual methods of seasoning for ordinary purposes is by piling the manufactured wood in the open air and allowing a free circulation of air to pass through the pieces. When used for furniture and cabinet making it is usually seasoned in a hot air chamber. As much as 508,000 feet of good lumber have been cut off one acre in the Comox district, and this, although trees under two and over seven feet in diameter, were not used. This is by no means the only instance recorded of so large a cut.

The wood next in importance is probably the Cedar, generally known as Red Cedar; it is also sometimes called Yellow Cedar, (not to be confounded with Yellow Cypress or Cedar); botanically it is known as Thuya Gigantea—Nutt.

The synonyms are :

Thuya plicata.—Dom.
Thuya Menziesii.—Dougl.

This tree is very generally distributed on Vancouver Island and the coast of the mainland to the westward of the coast range. Scarce in the dry central plateau, it however again occurs in considerable quantities in the Selkirks and gold ranges of the mountains. As in the case of the Douglas Fir, the finest specimens are to be obtained in proximity to the sea coast. Here the trees attain an immense size, some idea of which may be formed from the fact that some of the native canoes which are all hewn out of the trunks, are six feet and more from the level of the gunwale to the bottom. An Indian plank hewn out of this wood is at present at the museum here, the dimensions of which are 5 ft. wide by 15 ft. long, and this is by no means anything like as wide as others on the west coast. Although second in importance as regards its economic value, it is a more valuable wood than the Douglas Fir, being used principally for interior finishing, cabinet making, doors, shingles, and posts. It is very ornamental when properly finished, splits well, and lasts a long time in the ground. In a specimen bundle of split shingles sent by this Department to the Chicago Exhibition, each shingle measured 22 inches wide, and split boards quite straight from 12 to 15 inches wide and 12 feet long. As regards attacks of insects, dry rot, seasoning and accessibility for transportation, my remarks under Douglas Fir will also answer for this wood. As an ornamental tree it has few equals, and is certainly the finest of our native trees.

Very little below Cedar as regards its economic value is the Spruce, botanically known as Picea Sitchensis.—Carr—with the synonyms of

Pinus Sitchensis.—Bong.
Abies Menziesii.—Lindl.
Pinus Menziesii.—Dougl.
Abies Sitchensis.—Lindley & Gordon.

Dawson says, "This tree seems to be confined chiefly to the immediate vicinity of the coast of British Columbia, where it attains a large size." It grows in large quantities in all low lying land in the vicinity of the coast, and is therefore easily accessible for transportation. Its height is not so great as that of the Douglas Fir, but if anything it is larger at the butt; I myself saw one which measured nearly sixteen feet in diameter. The wood of this tree is very white and light, resembling white pine, but is more elastic, and will bend with the grain without splitting. It is therefore much used for boat building, light spoon bladed oars, boxes, shelving and interior work. It lasts a long time without decaying and is an equally good insect resistant as the Douglas Fir. As the shrinkage is generally very great, it is generally kiln dried before using, or kept stored away until it is thoroughly seasoned. On account of the sharp pointed short fronds it is quite impossible to grasp them in the naked hand, and this renders this tree easily distinguished from the other Coniferae.

The Yellow Cedar or Yellow Cypress probably ranks next in its economic value. It is known botanically under the name of Thuya Excelsa—Bong—and the synonyms of

Cupressus Nutkaensis.—Hook.
Chamaacyparis Nutkaensis.—Spach.

This tree is not nearly so plentiful as any of the foregoing, its range being confined to the coast ranges of the mainland and islands, generally at a considerable elevation in the southern part of the province, where it occurs in no great quantities. On Queen Charlotte Islands, however, Mr. Dawson says, it is abundant and reaches the sea level. It there also attains a size of six feet and more in diameter. In my experience I have seldom seen it over four feet. On account of its beautiful color and close grain it takes a high polish, and is susceptible of being manufactured into beautiful articles of furniture and interior decorations, hence it commands a much higher price than the woods previously mentioned. It is highly esteemed for ship building, as it is very durable, and is generally credited on account of its strong, pungent, but rather agreeable odor to be teredo resistant; of this, however, I am not prepared to vouch. The natives of the northern part of the province use it largely for paddles, carvings, boxes, and articles of domestic use. It is said that on account of its liability to shrink lengthwise, as well as laterally, it requires to be well seasoned for use. The expense of bringing this timber to shipping points is somewhat great, except in the northern parts of the province, where it abounds near the sea coast. The long and slender pendulous fronds which hang from the branches give the tree a very graceful appearance, and the strong pungent odor of the wood which it emits when freshly cut, and which it never loses, renders it very easy of identification.

The Hemlock, known botanically as Tsuga Mertensiana—Carr—and its synonyms of

Pinus Mertensiana
Pinus Canadensis—Bong
Abies Mertensiana—Lindl
Abies Albertiana—Murray
Pinus Pattoniana
Abies Pattonii—McNab

is, except the bark, practically unused at the present time. Its range extends over the whole of the coast line, where it grows to an enormous size in dark, gloomy forests, generally barren of other vegetation, except scattered bushes of the whortle berry (Vaccinium parvifolium), with a thick carpet of moss covering the ground. The bark is extensively used for tanning, but the wood, although good for inside work, is liable to decay when exposed to wet. It is but fair to say that partly on account of the abundance of other coniferous woods, and the prejudice existing against it, it has never been fairly tested, and it is quite possible it may possess unexpected virtues. As its habitat is generally at no great distance from the sea, it is a wood which could be transported to shipping points without great expense. When young or growing singly the tree is decidedly pretty, and the yew like fronds which enshroud the trunk form a most welcome and soft bed for the weary prospector or trapper.

The Western White Fir or Balsam Fir, Abies Grandi—Lindl—synonyms :

Pinus grandis—Dougl
Picea grandis—Loudon
Abies Gordoniana—Carr
Abies amabilis—Murray

is quite common in the vicinity of the coast, and grows to a large size, but the wood is held in small esteem, being perishable and brittle. It is, however, white and light, and may in course of time be put to use for boxes, etc. The bark when young is thickly covered with large bladders or cells filled with a liquid resinous gum which has great healing properties.

The tree, with its thick flat fronds and rigid growth, although grand in appearance, is rather too stiff and formal and too much of the Noah's ark type to be quite pleasing.

The Western White pine, known as Pinus Monticola (Douglas), with its synonyms of

Pinus strobus var monticola (Nutt.)
Pinus porphyrocarpa (Lawson.)
Pinus strobus (Hook.)

Dawson says: "It is found in scattered groups, but in no great quantities, on the slopes of the mountains of the interior, where the rainfall is plentiful, and in certain parts of the interior of Vancouver Island it is abundant, and is found in all parts of the southern portions of the Coast Range where there is an abundant rainfall." This wood is nearly identical with and nearly equal to the celebrated "King of Woods," as it is called, the White Pine (Pinus Strobus) of Eastern Canada. It has, however, thus far been but little utilized, partly on account of the difficulty of getting it in sufficient quantities all together, and partly on account of the expense of transporting it to shipping points. It is the most useful wood for window sashes, doors, powder barrels and similar work. Being a white and very light wood, it is unsuitable for outside work, and has a tendency to absorb moisture when in contact with the ground, and is therefore liable to decay. It is a very grand looking tree, with long bluish green fronds, and cones from eight to twelve inches long.

The other coniferæ of the Province do not in my opinion require special descriptions, growing as they do in comparatively limited quantities, many of them in the interior of the country, and only used in default of better timber. Some of the principal varieties are:

Western Yellow Pine or Bull Pine (Pinas Ponderosu. (Dougl.)
Pinus Resinosa (Hook.)

Its habitat is the dry plateau of the interior mainland, between the coast and gold ranges. It is a remarkably handsome tree, with smooth red bark, very long fronds, and large cones bearing a large quantity of seed, which

*Paper read before the Canadian Forestry Association, Ottawa, March 7th, 1901.

the natives formerly used as an article of food. Synonyms :

Scrub Pine (Pinus Contorta, Dougl.)
Pinus Inops (Hook.)
Pinus Banksiana (Lindl. and Gordon.)

ts habitat is everywhere in the Province on Sandy nts and exposed rocky points, seldom growing larger th inches ; quite useless for timber and not at all ornamental. Black Pine (Pinus Murrayana, Balfour.) Synonyms :

Pinus Contorta (Macoun.)
Pinus Contorta par Latifolia (Dawson.)
Pinus Inops (Hook.)

Its habitat is on the slopes of the mountains of the interior of the Province, where it grows in dense masses very straight and long, but of no great size. Most useful for mining purposes, being strong and durable and the only wood procurable in many of the mining districts. It is said to make excellent charcoal, the only coniferous wood to my knowledge that is used for the purpose.

Larch or Western Tamarac (Larix Occidentalis, Nutt.) Synonyms :

Pinus Larix (Dougl.)
Pinus Nuttallii.

On the slopes of the mountains of the interior mainland. Used for rails, interior fittings, and shakes or shingles, where cedar is not available.

There are several other coniferous trees of the fir or pine and juniper order, which I do not think are necessary to mention particularly.

Broad leaved maple (Acer Macrophyllum.) This is probably the commonest and best of our deciduous woods. Its range is all over the lower lands of Vancouver Island, the Gulf Islands, and the mainland to the westward of the Coast Range. It grows to a large size, the trunks frequently attaining to a diameter of three or four feet, and when growing close together or with other trees, very straight and tall. When growing singly in the open, it forms a magnificent shade tree. One remarkable specimen near Victoria covers a space of probably eighty feet in diameter. The wood is close grained, takes a fine polish, and is well adapted for furniture, inside finishing and carriage building. That part which by reason of an abnormal growth is known as bird's-eye maple is very beautiful. Although used by furniture makers in some cases for inside work, it is comparatively little used, and is only cut by one or two mills to supply the demand.

There are two other native maples, viz., the Vine Maple, Acer circinatum, and another resembling it called Acer glabrum. The former is common on the low lands of the mainland to the westward of the Coast range, but does not occur to the eastward of the Coast range, nor on Vancouver or Gulf Islands. As its name implies, it only grows small and crooked, much in the shape of a vine. The latter occurs all over the province, principally in the dry belt to the eastward of the Coast range, where it never gets beyond a bush ; and on the islands, where it frequently attains to the dignity of a small tree.

Alder, Alnus Rubra, (synonym A. Glutinos) is another common tree on Vancouver and Gulf Islands and on the mainland to the westward of the Coast range. It attains in many places a diameter of two or three feet, but much of it is under two feet. Growing as it does in close forests, it runs up to a considerable height and is very straight. The wood, which is of a light brownish color, nearly white, resembles black walnut in the grain, and is used, stained to the proper shade, to a limited degree in imitation of that wood, for furniture, inside furnishing, bannisters, &c.

The only other representative of this genus is the mountain Alder, A. rhombifolia, a worthless variety and more of shrub than tree. Its range is general throughout the province, generally on mountain sides.

Poplar or Cottonwood (Populus Trichocarpa), sometimes called P. Balsamifera, is a common tree throughout the province on low lying lands in the vicinity of water. It attains to a large size in favorable localities, three or four feet in diameter being common, and attaining a great height in dense forests along river banks and on low islands. The wood is very little used, being white and soft, without any great quality to recommend it. The principal use it has been put to is for the manufacture of excelsior, for which purpose it is well adapted. It has also been used for boxes, being very light. but the objection to its use for this purpose, I am informed, is that it turns dark after being sawed. Possibly this difficulty could be overcome by allowing the wood to season in the log, or other methods.

Another representative of this genus is the Aspen leaved Poplar (P. tremuloides). Its range is also very wide, occurring as it does in all parts of the province. It does not attain to any great size, twelve inches being probably about the limit. The principal use it is put to is for fence rails in that portion of the province to the eastward of the coast range where other timber is scarce.

Oak (Quercus Garryana or Jacobi). The range of this tree is altogether confined to Vancouver Island and Gulf Islands, not a single specimen occurring on the mainland. Patches of it occur at the southern end of Vancouver Island and for about one hundred and fifty miles north. In some places it attains a size of from three to four feet in diameter, with good straight trunks from which logs can be obtained ten to twenty feet in length. It is likewise a highly ornamental shade tree. The wood resembles English Oak in appearance, having a beautiful grain, but it has never been much used, principally, I believe, on account of the difficulty of seasoning it properly, or rather the necessary room and capital for storing it away for several years. It is used to a limited degree by cabinet-makers, etc., for ornamental furniture and other purposes of that kind.

Canoe birch (Betula Papyrifera) is common on the mainland and very scarce on Vancouver Island. The wood is a good fine grained durable one when not exposed to the weather, but it has never been used to my knowledge for any purpose but for fire wood. It attains a size of from one foot to eighteen inches in diameter, but is often smaller.

Arbutus or Madrona (Arbutus Menziesii). This is quite a common tree on Vancouver and Gulf Islands and on some parts of the coast line of the mainland. It is a striking looking tree with its red bark and bright evergreen leaves. As a rule it does not attain to a great size, especially when growing on exposed rocks and headlands, but trees a foot in diameter are common, although, as a rule, twisted and crooked ; when growing in forests, however, it grows fairly straight and sometimes attains a large size. On the Albernia Road, in the vicinity of Nanoose Bay, many fine specimens are to be seen. When travelling in company with Dr. Fletcher and Rev. Mr. Taylor two years ago, I took the measurement of one tree which was ten feet five inches in circumference. I am not aware that the wood of this tree has been put to any particular use ; it is hard, fine, and close grained, and takes a good polish, but it is apt to warp and check if cut before it is well seasoned.

Dog Wood (Cornus Nuttallii). A highly ornamental tree with immense white flowers, fairly abundant throughout the islands and the coast of the mainland. It often attains a size of twelve inches in diameter and a height of thirty feet or thereabouts, and has a fine grained, hard, pinkish wood which takes a good polish. Not used to my knowledge except in isolated cases for ornamental work.

Buckthorn, sometimes called Bearberry, and from that wrongly often called Barberry (Rhamnus Purshiana) is not an uncommon tree on the islands of Vancouver and the Gulf and on the coast of the mainland. It attains a size of about a foot in diameter, but more frequently smaller. The wood is of a light yellow color, close grained and hard. Not used except for ornamental purposes.

Crab (Pirus Rivularis) grows commonly in swamps on the mainland to the westward of the coast range, on Vancouver Island and the Gulf Islands. It seldom attains a larger size than nine inches. The wood is hard and close grained, and is principally used for rollers in mills and similar purposes.

The following is from a paper supplied by the government to the Forestry Commission at Chicago in 1893, but I am not now prepared to vouch for the correctness of the figures :

"The average cut is easily 50,000 feet per acre. On the Mainland and Vancouver Island it has varied from 20,000 to 500,000 feet per acre."

Messrs. King and Casey cut 508,000 feet on one acre in the Comox district. This is not the only instance of so large a cut. And this although trees under 2 feet and over 7 feet were not used.

QUANTITY ON THE PRESENT LIMITS.

The acerage is at least this year (1893) 400,000. Suppose the average to be 30,000 feet to the acre, this would give 12,000,000,000 feet on the limits now occupied.

CUT PER ANNUM.

In 1892 the cut was 64,000,000 ft. Add for waste and cut unreported say 40,000,000 ft. This would give 100,000,000 ft. At this rate the present limits would last one hundred and twenty years. This, however, supposes an average of 30,000 feet per acre, no bush fires, and no increase in the annual output.

It is estimated that fire destroys fully 50 per cent. of the timber. This reduces the time from 120 to 60 years. However, the output must rapidly increase and will in the near future be treble what it is to-day. At this rate of cutting the present limits would be worked out in 20 years.

Some say one-third of the limit of the province is taken up. Suppose the entire acreage (of the average 30,000 ft. to the acre) be three times that taken up now. This would give 1,200,000 acres. The time required to cut the entire amount at three times the above output would be 60 years.

Although various causes will hasten the lessening of our forests the natural growth must add considerably to the amount above stated.

The chief element of destruction is fire, which should be guarded against both by the mill owners and the Government.

EXPORS FOR THE FOUR YEARS ENDING JUNE 30TH, 1894.

(To all countries including the United Kingdom.)

Burrard Inlet.....	136,054 M feet.	Value	$1,385,980
Victoria.....	8,352 M feet	"	70,541
Nanaimo.....	6,532 M feet	"	55,128
New Westminster...	5,900 M feet	"	50,012
	156,838		$1,561,661

(To the United Kingdom alone.)

Burrard Inlet.....	7,161 M feet.	Value	$113,304
Victoria.....	30 M feet	"	255
Nanaimo.....	836 M feet	"	12,180
New Westminster....	nil.		
	8,027		$125,739

The quantities are approximate, but the values are accurate and include fir, cedar and spruce planks, boards, deals, spars, masts, square timber, laths, poles, and posts.

The provisions of the acts relating to the forests are succintly as follows :

The Chief Commissioner of Lands and Works is authorized to grant special licenses to cut timber on Crown lands.

No such license is granted for a larger area than one thousand acres nor for a longer period than one year. License costs $50.

License entitles holder to all rights of property whatsoever in all trees, timber or lumber, within his limits.

The Chief Commissioner of Lands and Works is also authorized to grant a general license to hand loggers upon payment of ten dollars to cut timber upon Crown lands, not being timber limits, without any reservation as to the area ; such license is personal, however, and limited to one year.

A ground rent of five cents per acre is charged and a royalty of fifty cents per thousand feet, board measure, for general timber suitable for spars, piles, saw logs, railroad ties, props, shingle bolts of cedar, fir or spruce, and a royalty of twenty five cents for every cord of other wood.

A drawback is allowed on exported timber equal to one-half of the royalty. "Timber lands (that is lands which contain milling timber to the average extent of eight thousand feet per acre, west of the Cascades, and five thousand feet per acre east of the Cascades, to each one hundred and sixty acres) are not open for sale."

Under the Bush Fire Act any portion of the province may be created by order in council a fire district. It is unlawful to start a fire in a fire district between 1st of May and 1st October, except for clearing land, cooking, obtaining warmth, or for some industrial purpose. Precautions must be taken in clearing land not to allow fire to spread, and in other cases fires must be extinguished before leaving.

Locomotives are required to have spark screens on their smoke stacks.

Now, whilst the provisions of the acts relating to forest conservation are good as far as they go, the difficulties of enforcing them in a country but sparsely settled are so great that many of them are practically inoperative, and the question naturally arises how can this be remedied. The elaborate and undoubtedly efficient remedies pursued in older countries, notably Germany, are not suited to a

wild country; the cost alone of maintaining an armery of forest rangers is sufficient to appall any government undertaking the task, and after all would such a system be efficient? I doubt if it would, only to a limited degree. Those areas of forests lying beyond the limits of civilization would still be liable to the devastating influence of forest fires set out in many instances by prospectors in search of mineral wealth, in others by carelessness, and in some instances possibly by natural causes. Nevertheless no other system seems apparent, and if properly managed, it could, I believe, be made effective in those portions of the province adjacent to settlements and where the operations of the lumbermen and woodmen are carried on, and where also by special taxation the system might be made self sustaining.

In conclusion let me say to those members of the Canadian Forestry Association who have not visited the West that they have yet to see a forest in all its magnificence. No other word seems to me to convey a proper idea of a virgin forest of the west. Picture to yourselves thousands of trees, Douglas Fir predominating, of prodigious size, so close together that it is with difficulty and often impossible for an animal to go between, limbless except the tops through which the rays of the sun scarcely penetrate, the ground carpeted with mosses and ferns, and the hush of nature all around you, and you can perhaps form some idea of a forest in British Columbia.

DISCUSSION.

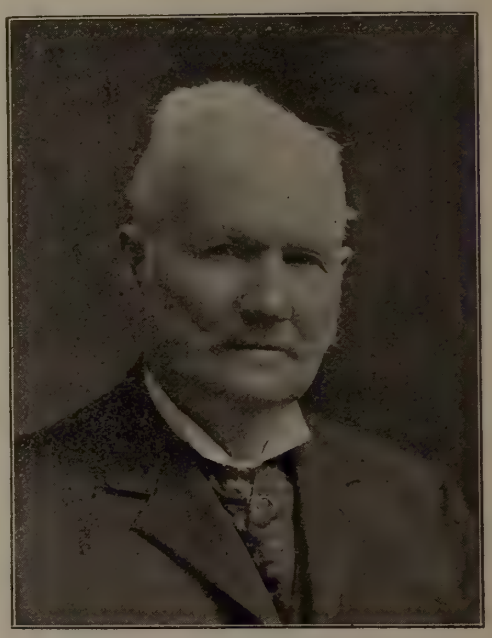
Dr. Saunders said that he could confirm the statements that were made by Mr. Anderson regarding the great forest wealth of British Columbia. In going through a forest thirty miles from Victoria he had found the trees so numerous as to make it difficult to get around. One tree which had fallen was measured and was found to be eleven feet in diameter and about 165 feet perfectly clear of branches, with about sixty feet with branches, making the total length of the tree about 225 feet. Speaking of the Experimental Farm at Agassiz, he said that on the mountain thousands of forest trees had been planted. Where they could get sufficient sunlight they had grown rapidly, which showed that it was the proper climate for tree growing. The ferns which grew very high on tops of mountains proved an obstacle in growing trees, as they shaded and partly smothered them and retarded growth. Now, however, some of these forest trees were getting above the ferns and were making better progress. These experiments, he thought, would be found very valuable as showing what varieties of trees should be grown, and especially in the case of hardwoods, which are greatly needed in British Columbia.

Prof. Macoun said that Mr. Anderson's paper was a thorough description of the forest trees west of the Cascade Mountains and on Vancouver Island, but not of the timber of the interior. At Comox 508,000 feet of timber had been taken from one acre without cutting the trees below two feet and over seven feet in diameter. In some sections there were trees ten to twelve feet in diameter, which are very difficult to cut owing to their size. As showing the great height of some of the trees of the interior, he said that thirteen ties 8 feet four inches in length had been cut out of one tree, and this tree small enough to make ties. The territory to which he referred extended from the 49th to the 60th latitude, and from 300 to 500 miles in width. In Northern British Columbia there were immense tracts of white and black spruce of the same quality as found in the Maritime provinces. These trees grew much larger in the west, many of them reaching three feet. Prof. Macoun lamented that much of this valuable timber was being destroyed by fire, but said that in the northern part of British Columbia fire could not destroy the timber, because the trees did not get dry enough to burn. The rotting of pine timber was caused solely by the fungus in the trees.

MR. R. McLEOD.

Reproduced on this page is the portrait of one of the oldest active lumbermen in Ontario, in the person of Mr. R. McLeod, manager of the London Lumber Company, of London, Ont. The likeness is a particularly good one, and was taken from a recent photograph.

Mr. McLeod was born in Scotland 74 years ago, and came to Canada when only three years of age. He learned the trade of cabinet-making and was for several years a manufacturer of furniture, pianos and organs. While in this business he acquired a thorough knowledge of the hardwoods required in the manufacture of furniture and musical instruments, and his company are largely patronized by manufacturers of these goods in Canada, the United States, and Great Britain. Some years ago Mr. McLeod entered into the hardwood business exclusively, under the name of the London Lumber Company, of which he has continued as general manager since



MR. R. McLEOD.

its inception. While dealing in all kinds of hardwoods, the company makes a specialty of sawing to order special size bills, such as birch and soft elm squares, quarter cut lumber, etc. Mr. McLeod is still actively engaged in the management of the business, and is enjoying excellent health for a man of his advanced age.

PUBLICATIONS.

In the 28th annual special issue of the Timber Trades Journal, of London, England, we find a combination of quantity and quality. The number is voluminous, neatly printed, and contains, besides the annual reviews and other articles, a sheet of portraits of timber trade represenatives at the war, also a very complete description of the timber trade of the Thames, with broadside map showing the position of the principal timber yards and saw mills on the river. Another interesting feature is an article under the caption of "1800-1900," being a glance at the timber trade of the last century. The publishers are William Rider & Son, 164 Aldergate Street, London, E. C.

The saw mill of Prowse Bros. at Souris, P.E.I., has recently been remodelled, and is now considered one of the best on the island. The new boiler was furnished by T. A. McLean, of Charlottetown, and the engine by the Waterous Engine Works Company, of Brantford, Ont.

PERSONAL.

Mr. C. Beck, of Penetanguishene, Ont., returned about the middle of April from his European trip.

Mr. A. Gunter has been appointed as superintendent for the Pembroke Lumber Company, in succession to Mr. C. A. McCool.

On April 19th Mr. H. B. Elderkin, of the firm of H. Elderkin & Company, ship builders and lumbermen, of Port Greville, N.S., was superintending the loading of a cargo of piling, when the tackle broke and a piece of piling swung round and struck him on the head. The injuries received resulted in his death three days later.

Many readers of the LUMBERMAN will be pleased to learn that Mr. John A. Bertram, son of Mr. John Bertram, of Toronto, has almost completely recovered from his long illness. Mr. Bertram was taken ill early last fall, from blood poisoning, and for a time was in a most precarious condition. He is now able to again give attention to business, and has gone to Little Current to engage in the inspection and shipment of lumber.

Owing to ill health, Mr. John Donogh retired from the Swan-Donogh Lumber Company, of Buffalo, N.Y., at the beginning of February last. His interest has been purchased by the Clark Jackson Lumber Company, of Duluth. It is probable that a new company will be organized to be known as the Clark-Swan-Jackson Lumber Company, which will absorb the old company.

The death took place last month of Mr. Robert Parker, until recently head of the timber importing firm of Robert Parker & Company, Liverpool, Eng. Mr. Parker commenced his business career with the firm of James Bland & Co., Canada Dock, which held the premier position of all the Liverpool timber trade. He went to Quebec as one of the assistants to Messrs. Dobell & Beckett, who represented there the interests of the Liverpool firm. Subsequently he was engaged in St. John, N. B., in making purchases and shipments for the house at home. Then he proceeded to Russia on similar business. Later he was in business as one of Carter, Taylor & Parker, and afterwards the firm was changed to Robert Parker & Co. He retired in 1899.

TRADE NOTES.

The Dodge Manufacturing Co., of Toronto, are sending out a neat little booklet containing a number of excellent testimonials from manufacturing companies, electric light companies etc., expressing satisfaction with the Dodge split friction clutch.

William C. Clarke and W. Demill, foremen respectively for the McGregor, Gourlay Company and Cowan & Company, of Galt, have formed a partnership, and will engage in the manufacture of woodworking machinery. Their factory will be located in Galt.

A new and very complete catalogue of embossed and turned mouldings, spindles, ornamental turnings, wood grilles, etc., has just been issued by the manufacturers, Boynton & Company, 67 West Washington street, Chicago, who will be pleased to send a copy to any subscriber of this paper on application.

Attention is directed to the advertisement on front cover page of this issue of Messrs. Horn Bros., of Lindsay, Ont. This firm make a specialty of all kinds of lumbermen's blankets, and sell direct to the consumer. They have supplied many of the largest dealers in competition with home and foreign manufacturers, and have filled several large government contracts. They manufacture union and all wool blankets, check horse covers, mackinaw cloth, long stockings and socks, using all pure wool. Lumbermen will find it to their advantage when requiring any of the above goods to correspond with them.

Attention is called to the advertisement of Mr. J. H. Wallace, C.E., and the Drewsen Co., of New York, appearing in the pulp department. Mr. Wallace, who was formerly a member of the firm of Tower & Wallace, mill architects, has recently associated himself with the Drewsen Co. for the purpose of carrying on the business of mill architects, engineers and chemists. They are prepared to furnish surveys, plans, estimates and specifications for foundations, buildings and entire equipments for paper and pulp mills, and for water, steam and electrical power development and transmission. The Drewson Company will give special attention to the design and construction of sulphite fibre mills and to the chemical work. The ground wood pulp, soda fibre and paper mills and other work will be attended to by Mr. Wallace.

CANADA LUMBERMAN

WEEKLY EDITION

The Lumberman Monthly Edition, 20 pages } $1.00 PER YEAR { The Lumberman Weekly Edition, every Wednesday

THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN, THE UNITED STATES, AND OTHER FOREIGN MARKETS.

VOL. VII. TORONTO, ONT., MAY 1, 1901 No. 14

CANADA LUMBERMAN

PUBLISHED BY

The G. H. Mortimer Publishing Co'y of Toronto, Limited

Confederation Life Building - TORONTO.

Branch Office:
IMPERIAL BUILDING, MONTREAL.

Weekly Lumberman, published every Wednesday. Contains reliable and up-to-date market conditions and tendencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canaian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

Lumberman, Monthly. A 20-page journal, discussing fully and impartially subjects pertinent to the lumber and wood-working industries. Contains interviews with prominent members of the trade, and character sketches and portraits of leading lumbermen Its special articles on technical and mechanical subjects are especially valuable to saw mill and planing mill men and manufacturers of lumber products.

WANTED AND FOR SALE

FOR SALE.

About 3½ million feet of White Pine, mill run. ½ million feet dry; cut last August. Address,
W. G. DOHERTY, Day Mills, Algoma, Ont.
or
W. DOHERTY & CO., Clinton, Ont.

FOR SALE.—36 in. Wickes Gang, cutting 14 in deep; located in Canada; price low. WICKES BROS., Saginaw, Mich.

FOR SALE—ONE MILLION FEET GOOD White Pine Mill Culls, Dry. Address "OTTAWA," office CANADA LUMBERMAN.

FOR SALE—1,000,000 FEET OF PINE and Mixed Timber, close to railway. Apply to E. TODD, 131 Brant St., Brantford, Ont.

FOR SALE — TWO THOUSAND CEDAR Fence Posts; 8 cents for split, 9 cents for round, f.o.b. cars, Leslie's Station. Apply N. H. HOWARD, Lynden P. O., Ont.

FOR SALE—We have about 65,000 feet of bone-dry Hard Maple, 1¾" and 2" thick (mostly 2"), 12, 14 and 16 feet long. Kindly write for prices, etc. Address, WALKERVILLE WAGON CO., Walkerville, Ont.

FOR SALE.

A LARGE QUANTITY OF GOOD SOUND Tamarac lumber in standard sizes, 2x4, 2x6, 2x8, etc.; Dimension timber, 16 ft. long, 4x4, 4x6, 6x8, 8x8, etc. Also other sizes cut to order. Apply to EDWARD LLOYD, Limited, Sturgeon Falls, Ont

White Pine for Export.

Correspondence with reliable saw-mill concerns with large steady stocks—specially good shelving grade.
"EXPORTER,"
10 Wall Street, New York City.

WANTED — EXPERIENCED LOGGING foreman for Newfoundland, capable of organizing and taking charge of logging camps with horses and men on a large scale, working summer and winter. Apply, stating experience and salary required, to LEWIS MILLER & CO., LIMITED, Glenwood, Newfoundland.

FOR SALE.

SAW AND PLANING MILL COMBINED, AT Acton, Ont.; well equipped and machinery in perfect order. Plenty of timber with which to operate for many years; wood business in connection. Business well established and profitable. For further particulars and terms apply to the proprietor.
JAMES BROWN,
Acton, Ont.

WANTED — STOCK TO CUT BY THE thousand. Have two Waterous Portable Mill, fifty and thirty horse power, immediately available. WELLINGTON WOODEN, Sturgeon Falls.

WANTED.

A QUANTITY OF GOOD ONE INCH CEDAR, any length, delivered at once.
PETERBORO' CANOE CO., Limited,
Peterboro', Ont.

FOR SALE.

SAW AND WOOLLEN MILL, BLOOMFIELD. A snap, as executors must sell. Yearly profits should make payments required.
WM. BOWERMAN,
26 Adelaide W., Toronto.

FOR SALE.

ABOUT ONE HUNDRED THOUSAND FEET of White Oak timber, within three miles of two railroad stations. Will sell timber standing or cut same. Also a quantity of white oak piles from 6 to 10 inches at top end. Address—Box 78, Dresden, Ont.

WANTED—BIRCH (Immediate).

Thirty thousand feet four inch firsts and seconds.
WM. B. YOUNG, Agent,
10 Wall St., New York city.

Province of Quebec.

DEPARTMENT OF LANDS, FORESTS AND FISHERIES.

WOODS AND FORESTS.

Quebec, 23rd February, 1901.

Notice is hereby given that, conformably to Sections 1334, 1335, and 1346, of the Consolidated Statutes of the Province of Quebec, the timber limits hereinafter mentioned, at their estimated area, more or less, and in their present state, will be offered for saleatpublic auction in the Department of Lands, Forests and Fisheries, in this city, on TUESDAY, THE 4TH DAY OF JUNE NEXT, at eleven o'clock a.m.

CONDITIONS OF SALE.

No limit will be adjudged at less than the minimum price fixed by the department.

The limits will be adjudged to the highest bidder, on payment of the purchase price, in cash or by cheque accepted by a duly incorporated bank. Failing payment, they will immediately be re-offered for sale.

The annual ground rent of three dollars per mile, with fire tax, is also payable immediately.

Those timber limits, when adjudged, will be subject to the provisions of all timber regulations now in force or which may be enacted hereafter.

Plans of limits offered for sale are pen for inspection in the Department of Lands, Forests and Fisheries, in this city, and at the offices of the Crown lands and timber agents in the different agencies in which said limits are situated, up to the day of sale.

N. B.—No account for publication of this notice will be recognized, if such publication has not been expressly authorized by the department.

S. N. PARENT,
Commissioner of Lands,
Forests and Fisheries.

CURRENT TRADE CONDITIONS.

ONTARIO.

The month of April, although not characterized by unusual activity, witnessed the movement of considerable lumber by rail, chiefly to local points and the Eastern States. If the predictions of the trade are to be realized, a much larger volume of business will be done during May. Everybody seems hopeful of a prosperous season, and this confidence alone will serve as an inspiration towards the placing of orders. The hopeful feeling which pervades the trade is based on a solid foundation; enquiries for stock are becoming more numerous, building is brisk, and manufacturers are fully employed. There is also a better inquiry for export stock. Before the new cut is in shipping condition, the stocks that were carried over will have become greatly depleted; in fact, it is now difficult to purchase any large quantity of certain grades of pine. The fact that early shipment of lumber purchased in the winter and spring is being urged, shows that stocks are low and that buyers are in need of the lumber. Several large lots are about to be shipped from the Georgian Bay to Michigan points. There seems to be more call for mill culls than for the lower grades generally. Hemlock is getting very scarce and higher prices are being asked. In hardwoods there has been only a slight improvement. Mills are planning to reduce the output this season, so that there is not likely to be any difficulty in maintaining the present prices. The statement that lath will advance has been further evidenced by the transactions of the past week.

QUEBEC AND NEW BRUNSWICK.

Vessels are now loading lumber at Quebec for the United Kingdom, and a number of charters have been effected for loading at St. Lawrence ports during May and June. Spruce deals seem to be a little firmer and in somewhat better demand. In square and waney timber the only change to note is a slight advance in Michigan waney pine, which is now quoted at from 48 to 52 cents per cubic foot.

The reports from the drives in Quebec and New Brunswick are very favorable, although all the logs will not be in safe waters for some time yet.

MANITOBA AND BRITISH COLUMBIA.

The weather throughout Manitoba and the Territories has not been favorable for outdoor work. The farmers are in the midst of seeding, and the lumber trade, consequently, is rather quiet. Large building operations, however, are comtemplated, and an early improvement in the demand for lumber is looked for. Railway and bridge timber is in good enquiry. A better demand for shingles is reported by British Columbia dealers, particularly for shipment to the east. Band sawn shingles are quoted at $3.35 in Victoria, dimensions at $2.85, No. 1 at $2.35, and No. 2 at $2.10. Lath is quoted at $4 for 3-8 x 1 3-8 in. x 4 feet.

UNITED STATES.

The past week has not witnessed a large movement of lumber, but transactions have taken place which show that the tendency of the market is upwards. Sales of mill culls have been made at $12.50 at the mill, and it is generally conceded that the lower grades of lumber are not as strong as the better qualities. At Buffalo and Tonawanda stocks of white pine are badly broken, and buying among dealers for assortment purposes is quite common. There is a scarcity of the best grades. The call for building lumber is improving, and it seems likely that this year will be a banner one in building construction. Spruce is showing exceptional strength. An anticipated shortage in the eastern log crop has advanced the price of logs to $15 per thousand. The present selling price of spruce lumber is, therefore, much too low, and an advance must be made if the manufacturers are to make a living profit. The hardwood trade is rather disappointing. Consumers, for some reason not easily explained, are pursuing a hand-to-mouth policy, and are purchasing, it would seem, only for immediate requirements. As the general condition of manufacturing industries is prosperous, it is believed that this policy will shortly give way to one of more liberality, particularly as hardwood prices are not likely to decline. Lath continues to be scarce, and higher prices are almost certain to rule in the near future. In our Buffalo price list the price of black ash has

GREAT BRITAIN.

Business in British timber circles is proceeding very slowly. Buyers are exercising what seems to be unnecessary caution, as there are many indications that prices have reached the bottom. Notwithstanding, the recovery is likely to be very gradual. At recent auction sales prices generally have declined, but it is significant that the best classes of deals have held their position with a marked degree of firmness. The spruce trade is showing more life. Dealers who have purposely delayed buying in the expectation that shippers would accept reductions from the fixed first-open-water prices, are now offering £8 10s and £8 per standard c.i.f. London for 3x9 second and third quality. At these figures they have been unable to effect purchases, an advance of 5s on these prices being asked by shippers, while £8 10s c.i.f. is predicted for third quality within a short time. Charters effected in Great Britain show a lower tendency of freights, 41s being the average for large vessels from the Maritime provinces, 42s 6d from the St. Lawrence to west coast of Great Britain, and 46s 3d to east coast.

STOCKS AND PRICES.

The str. Heighington is about to load a cargo of deals at Quebec for London.

The barque Bahama is loading box shooks at Hall's booms, Quebec, for the Canary Islands.

The tender of D. E. Sprague has been accepted for the annual supply of lumber to the city of Winnipeg.

The ship Roland sailed last week from Chemainus, B. C., for Greenock, with 834,560 feet of lumber.

Short hemlock is selling in the Chicago market at from $9.25 to $9.50, and long hemlock about $1 higher.

At Buffalo staves and coiled hoops for slack barrels are selling at $8 to $8.25, and first-class basswood heading at 6 to 6¼ cents.

Purcell & Kelly, of Port Arthur, Ont., have purchased from Seaman & Company all the lumber cut by them at Shebandowan during the past winter.

Michigan white pine is quoted in Saginaw at $20 to $24 for log run, Canadian at $17 to $21 ; box lumber at $14 to $14.50, and special bills from $14 upwards.

At the Crown Lands office, Fredericton, N.B., two timber berths were sold last week as follows : Head of Young's Brook, branch of Caraquet River, two miles, to W. T. Whitehead, at $9 per mile ; Big Sevogle River, 3 miles, to E. Sinclair, at $133.50 per mile.

Tenders are invited for the Department of Interior at Ottawa up to May 13th for licenses to cut timber on Berth No. 971, situated on the south side of the Saskatchewan river, and Berth No. 972, containing one and nine square miles respectively, both in the district of Alberta.

The Central Lumber Company, of Saginaw, Mich., have sold all their mill culls of the coming season's run, estimated at about 3,500,000 feet, to local dealers at $12.50 a thousand. A few years ago mill culls were a drug at $6. E. Nelson has sold 3,500,000 feet of Michigan white pine stock, cut at Cheboygan, to eastern parties, at between $22 and $25 per thousand for log run.

The following export shipments of lumber from Vancouver, B.C., were made during the week ending April 20th : Barque Anna, for Valparaiso, Chili, with 1,332,873 feet rough lumber, by Robert Ward & Company ; barque Passepartout, for Sydney, Australia, with 401,801 feet rough lumber and 35,090 pickets, by North Pacific Lumber Company ; barque Antuco, for Callao, Peru, with 1,225,458 feet lumber by B.C. Mills, Timber & Trading Company.

Do not neglect to read the advertisements in each issue of the WEEKLY LUMBERMAN. They contain much of interest.

THE LOG DRIVES.

FREDERICTON, N. B., April 25th.—The news from the Upper St. John log drives is encouraging. W. H. Cuniff & Sons, who operate on the Allegash, have all their logs out of the small streams. They will take out about 14,000,000 feet for W. H. Murray and Andre Cushing & Sons. Charles E. Jones is out of Little Black river and into the main St. John with 3,000,000 feet for W. H. Murray. Neil McLean, who operated on Big Brook for W. H. Murray, is into the main river with 2,000,000 feet. John Sweany has 2,500,000 feet out of Brown Brook and into the main river. He operates for Andre Cushing & Son. R. A. Estey is through with driving on the Tobique after only eleven days' work. This is the quickest driving ever known on the Tobique for the amount of lumber which Mr. Estey brought out, three million feet.

McCollum, who operates on the Tobique for Hilyard Bros., is also out with his drive. Hale & Murchie's drive at the headwaters of the Tobique is coming along well.

Gilman Bros. and Burden, who operate on the Upper St. John, have their lumber all in the main river except about 1,000,000 feet, which is coming along nicely.

On the Nashwaak the drives are getting along better than for many years, the conditions being exceptionably favorable.

James Hallet, who operates on the Grand River for Randolph & Baker, has his cut of 2,000,000 into safe waters. Jacob Hazleton, who has 3,000,000 on the Restigouche, expects to finish stream driving about the middle of next week. Daniel Nixon, who cuts about 1,500,000 for the William Richards Company, will be out next week with all his cut.

Jas. Burgess & Sons, who cut 2,000,000 for their mill on Little River, already have their logs in boom limits ; and the same is true of J. A. Patterson, who has a cut of 4,000,000 on Salmon River.

Bank logs are now coming freely to Springhill, four rafts having arrived down to-day. The lumber is being purchased chiefly by John Campbell and Wilmott Guion. Good spruce logs are selling at $9.50 per thousand feet.

THE NEWS

J. Henderson has started in the lumber business at Eli, Man.

A saw mill will be established at Otter Lake, Ont., by W. A. Moore.

Buie & Early are enlarging their veneer factory at Georgetown, Ont.

The Rideau Lumber Company are building a saw mill at Barry's Bay, Ont.

Joseph Pritchard, of Killarney, Man., has opened out a lumber yard at Holmfield.

J. E. McArthur, of Winnipeg, has decided to build a large saw mill at Lac du Bonnet, Man.

Campbell & Ferguson, lumber dealers, of Melita, Man., recently gave a supper to their employees.

It is reported that the Veneer Box Company, of Burk's Falls, Ont., will erect a factory at Sundridge.

R. Robinson has contracted to drive the entire cut of logs on the Seguin river to Parry Sound, Ont.

The lumber agency of the Rathbun Company at Peterborough, Ont., has been sold to two local men.

It is reported that the Savanne Lumber Company will open a lumber yard at Grand Coulee, N. W. T.

The Brunette Saw Mill Company, of New Westminster, B.C., has installed in their mills three new boilers.

Treeman Bros. are building a saw mill at Ponoka, N. W. T., to have a capacity of 20,000 feet per day.

A Bay City firm is said to be negotiating for a site at Penetanguishene, Ont., on which to build a saw mill.

Schurman, Lefurgey, Clarke & Company are building a new wood-working factory at Charlottetown, P. E. I.

G. Kastner and J. P. Newman, of Wiarton, Ont., have each placed Dutch ovens in the boiler rooms at their saw mills.

J. P. Newman, of Wiarton, Ont., is building a scow for his lumber trade, estimated to carry 110,000 feet of lumber.

J. R. McKay, of Lansdowne, Pictou County, N. S. has recently sold out his lumber business to J. N. and F. T. Pugsley.

The McKinley, Wood Lumber Company have installed in their saw mills at Parry Sound, Ont., a new engine and two new boilers.

W. W. Doherty is reported to have sold his saw mill and boom privileges at Restigouche, N. B., to W. C. Purves, of St. John.

C. H. Witthun & Company, of Wiarton, Ont., have just installed in their saw mill a gang resaw, steam feed, lath mill and new boiler.

A new lumbering firm has commenced operations at Dillon's Bay, Ont., doing business under the style of the Shebeshekong Lumber Co.

J. F. Alcorn & Company, of Hartland, N B., has put in turning machines for making broom handles, and expects to turn out 12,000 a day.

It is reported that Mr. Haines, late of tne Blind River Lumber Company, intends building a saw mill at Lake Lauzon, near Algoma Mills, Ont.

A. B. Williams, of Nampa, Iowa, has purchased the machinery of the planing mill at North Tonawanda, N. Y., recently owned by J. & T. Charlton.

Captain J. J. Campbell, of New Westminster, B.C., has purchased over 3,000 acres of timber limits about 200 miles from Dawson, in the Yukon district.

J. W. Stout, trading as the Summit Lumber & Timber Company, has opened a branch of his lumber business at Greenwood, B. C., in charge of Sydney Oliver.

Mason & Gordon's saw mill at Ottawa, Ont., resumed operations for the season early in April, about a month earlier than last season. Another edging machine has been installed.

Judgment has been handed out dismissing the petition of Mr. J. B. Klock against the Sheriff of Nipissing to compel the latter to declare him elected as representative in the Dominion Parliament. Mr. Klock claimed the seat on account of the Sheriff's action in postponing the date of nomination. The present member elect is Mr. C. A. McCool, lumberman, of Geneva Lake, who retains the seat.

It is reported that the Eddy mill site at Revelstoke, B. C., has been purchased and that a large saw mill will be built, under the management of D. Robinson.

A donkey engine has been installed by Herbert Gilley in his logging camp at Mud Bay, B. C. There will be a wire cable 7,500 feet in length, and the logs will be hauled a considerable distance.

The Northern Lumber Company, Limited, of Dauphin, Man., is applying for incorporation. T. A. Burrows, J. Hedderly, W. J. Osborne, H. E. Crawford, and Isaac Cockburn are the applicants.

Frank Laurie is operating a saw mill at Parry Sound, Ont., and expects to make an average cut this season of 12,000,000 feet per day. The Parry Sound Lumber Company have overhauled their shingle mill and put in a new boiler.

Larger premises are required by Shurly & Dietrich, of Galt, Ont., in which to manufacture saws, bedsteads, and other lines. They have made a proposition to the town to erect a factory with 80,000 square feet of floor space.

The Georgian Bay Shook Mills, Limited, capital $40,000, has been incorporated, to take over the business of the Georgian Bay Box Company at Midland, Ont. P. Potvin, R. B. Little and William Finlayson are the promoters.

The C. C. Barker saw mill at Saginaw is being dismantled, and the machinery shipped to Collingwood, Ont., where Mr. Barker and Thomas McLellan, of Bay City, are building a saw mill, which is expected to be in operation this year.

At the annual meeting of the Tobique Log Driving Company held at Andover, N. B., last month, Henry Hilyard was elected president. The contract for driving the logs was let to E. McCollum, at the rate of 17½ cents from the forks of the Tobique to the St. John river, and proportionate rates from points below the St. John.

The Northern Pacific Railway Company has found its expiriment of hauling logs for lumber companies a financial and practical success. The parties making the contract are the Muscatine Lumber Company, of Muscatine, Iowa, and William Kaiser, also of Muskatine, Iowa. The total amount of logs which will be transported by rail from Northern Minnesota under the contract is about 20,000,000 feet, necessitating the use of 4,000 cars.

ROPE TRANSMISSION IN SAW MILLS.

It seems strange there are not more rope transmissions used in saw mills. Possibly the matter has not received the thought and attention due to it, or possibly, saw mill machinery men are not in position to furnish the necessary machinery for a "drive," and, therefore, ignore that system in submitting estimates for new work.

Rope transmission is particularly suitable for a band mill, yet out of about a dozen new

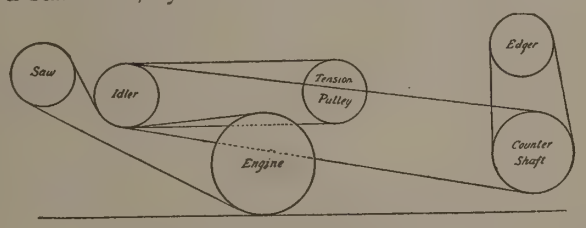

DIAGRAM OF ROPE TRANSMISSION.

band mills I have seen installed in late years, only one has a rope drive.

Hearing of it was, to me, to see it, and I cheerfully took the seven mile walk and the inconvenience of stranger, in a strange place, to get a look at it.

The mill was converted from a circular to a band, and had belts been used, it would have required that the engine be turned around to line with the drive shaft that had been changed to run parallel with the length of the mill. The engine had a band wheel, 18-inch face, very heavy, to answer as a fly wheel. This was left in place, and on the outer end of the engine shaft there was used an 8-groove pulley, carrying a 1¼-inch rope that made a quarter twist on two idlers and thence to the main shaft.

That is all there is connected to the engine—no edger counter to run, and heavy tighteners, nor any gearing nor framing of any sort near it. It is no trouble to get around it to work.

The edger is driven by a ¾-inch rope, four strands, and is run from the line shaft by two quarter-twist idlers. In the case of the engine, the tension carriage and tract are horizontal; at the edger it is perpendicular; in both cases of less than quarter the weight and strength required for tighteners for similar service.

The usual unsightly and cumbrous rig of a balanced swing saw or "jump" saw, gives place to a light frame jump saw, raised by friction and

WALKER'S ELECTRIC BOILER COMPOUND

and Sole Agents for Canada of the Brooks Oil Company, Cleveland

We have made a special and scientific study of the waters and conditions existing in the different localities in Ontario, and can cope with conditions existing anywhere. We don't care how hard or troublesome your scale is, we can clean your boilers without injury to boiler, packings or connections. BROOK'S OILS are perfect lubricants—give them a trial. Note the address—

The Electric Boiler Compound Co., Limited, Guelph, Ont

driven direct from its own shaft, without the usual two intermediate idlers, the single tension wheel handling the slack of the rope without all the equipment usual with a belt.

The only belt in use in the mill outside of the file room is used to drive a lumber transfer.

In the case of a circular mill, the rope drive especially commends itself. The sketch herewith is the plan of a circular mill now under way. In this case, as in that of the band mill, the one grooved pulley on the engine does all the work of the mill except the log haul-up, and that runs from small friction clutch pulley from the end of the engine shaft, that also being a rope drive. On the shaft carrying the idler is a groove pulley that runs the edger countershaft by traction of the rope drive to the saw. The plan shows two distinct drives from the one engine pulley, the tension pulley at the edger not showing in the sketch. An idler turning the edger rope to the tension carriage is used to drive a counter-shaft from which the cut-off saw and trimmer are run, and the other either drives the counter that runs the live rolls and refuse or slot chain.

In this case there is not a belt in the driving machinery of the mill, and only those on the trimmer, in contemplation.

Figures given by users who are in position to know give the cost of the two systems as about 40 per cent. in favor of rope, and the lasting qualities as above from 60 to 80 per cent. the same way. I know of an irrigating plant that was using a quart-twist belt, 10 inches wide, and used three belts a season. Six strands, or more properly, six ropes, one inch diameter, are now running their third season on a quarter-twist drive, and show no appreciable wear.

There is another feature of the rope drive distinctly advantageous to a circular mill, and that is there is absolutely no slip to the rope and no danger of choking down the saw as long as the engine is turning. The eliminating of slipping as a factor is of great advantage to the results of the motive power. As an example of how much this may contribute to the success of a mill, let me tell of some things I saw in a pine mill that was built to be the "crack" mill of the state in which it was located.

The mill was built for a double circular and gang; but, as seen in so many other instances, but one circular was installed. In this case the gang also stood idle. In looking for a cause I was told, and could easily see, that the outlet for the lumber could not accommodate more than 60,000 feet a day, having only one trimmer, and, while the sawing machinery could easily turn out three times that amount, the lumber could not be handled at the end of the mill.

I scraped acquaintance with the filer, and, noting a piece of 12-inch board standing against the wall, that showed marks of about a 30-inch feed, I made enquiry as to the saw belt. The engineer had told me it was the second belt in less than two years, and was 24 inches wide and endless. I saw that it was under a tightener, the weight of which added to the frame could not have been less than a ton. This "sample" of sawing that the filer was saving showed that the saw had choked down about 18 inches from the end of the log, but the momentum of the carriage had carried the log by and split off the board just as an axe would do. The filer was saving the board to show the manager what abuse his saws had to stand. If I had been the manager that would not go as an excuse, for his saws did not have enough hook to the teeth, and backs were too high to stand any feed. The sawyer knew this, and told me he did not propose to hold down the feed to suit the filer's idea of saw-fitting.

But to return to the belt. The engine never lagged at any cut, not even when the saw choked down, still carrying its load, with power to spare. Had this been a rope drive, the mill would have been benefited in the total output and in the grade of lumber, for every time the saw lagged I could see thick and thin boards, more especially in the 2-inch stock. At the planing mill the tale was told, for the sizer has all it can do to cut down the miscuts from the mill. This is one of the best constructed and best equipped mills that I have seen, but somehow or other the designer, the manager or the millwright must have run out of ideas before the job was through —not out of money, for they had it to throw away.

But we cannot expect to find perfection centered in one plant. I call to mind a plant I helped build, the original estimate of which was $42,000, and in six years it has been practically rebuilt twice. Originally designed to cut 50,000, it has never exceeded it, despite the addition of much new machinery. The millwright was one of the best known in this section. He said he would be ready in four months from the day the first framing was put on the ground, but notwithstanding the fact that it was only necessary to ask for material to have it at once, it was nearly seven months before we cut our first board. It may sound like telling tales out of school, but the beer bucket took too many trips to the corner during that hot summer.

In starting this mill there was another good chance to make some comparisons with rope and belt. The main drive belt was an endless rubber belt, 20 inches wide, and has been replaced about once a year, each time with a leather belt ready for splicing. A rope drive in a mill not far away is still running the same rope with which it started, and is probably good for two or three years more. This mill also had on the edge a leather belt, 12 inches wide, made endless, and when the mill started, in trying the engine, the belt tightener was carefully adjusted and the belt tracked exactly on both upper and lower pulleys. Being busy in the engine room, the belt was no longer watched, and in the course of a half hour the smell of burning leather called it to mind. We found it had run to one side, rolled up and was rubbing the boxing; it was totally ruined and gave an object lesson not to be forgotten. Had this been a rope drive such a thing could not happen.

The countershaft that carried the edge driving pulley was run from the line shaft by a bevel gear, and difference in cost would have been almost the total cost of the ten feet of shafting and the two gears, with the three journal boxes, the difference in cost of the rope sheaves and pulleys not being of much consequence, the millwright work being in both cases the same. In fact, I believe I would rather put up rope drives than belting, the results being so much more certain, and much more satisfactory to erect and operate.

There is another feature about it of which I don't lose sight, and that is the journal friction is in proportion to the load at all times, the tension pulley adjusting itself to the work with the sensitiveness of a governor. I recall a mill in which I worked that was one of the swift ones and cut an average of 85,000 feet. From the mill floor everything seemed to work smoothly and the mill looked clear and unencumbered by too much machinery. There were too bands, a double edge trimmer, three jump saws, slasher, sizer and four sets of live rolls and the transfer chains. On the lower floor a new hand simply got lost in the maze of false studding, bridging and belting. There was every sort of belt that had ever come into use, all trying to get the regular custom of the concern, but they changed foremen so often that no one sort of belt ever could get a steady advantage in the way of a regular indorsement.

One sort that did well in one place would not do in another, and the result was an assortment seldom equalled or hardly ever excelled. This condition of things was hardly one particular person's fault, but one of those that "just happens so." The manager was a chronic dyspeptic, and when he got a fit of his malady on and you ran foul of his ideas, your chances of standing at the cashier's window to get your pay were particularly good, no matter what your job. From my place in the mill at the sizer, I could get a good view of nearly all the lower floor, and have often figured out the rope drive for the mill —but I took good care to keep my reflections to myself.

I recently paid a visit to one of the crack pine mills and spent the day observing. The mill had one of the longest and best log haul-ups I ever saw, and although so long and with a heavy chain (1½-inch iron), it was driven by an 8-inch belt, being strongly geared. While there I saw one of those peculiar accidents that happen in milling.

The drive belt had got slack and the negro who hauled up logs had to use all his strength on the lever to get the belt tight enough to move the chain. The man at the boom end of the log slip put out logs on the chain as fast as the ends went up to make room, and it was not his business to watch the mill end of the chain. Getting tired of hard work, to keep the belt from slipping, the negro took down his dinner bucket, and from a cup he poured a couple of spoonfuls of molasses on the belt. At the highest touch of the lever the belt gripped and the logs moved right along. Mr. Negro had a grin on his face like a cut in a pie, for a few moments, but when he released the lever the belt still held its grip. On came the log up to the stop, knocking it down and going on over the bull wheel down on the mill floor. Another log followed its course, and still another. The man below supposed everything was all right and kept putting on logs, and the logs kept adding to the pile. The edger man and his crew left for outdoors, and it so rattled all hands that they forgot the signal whistle, and before the negro could run down to the engine room and get the mill shut down there was a couple of hours' sawing piled up in logs on the mill floor.

In the confusion resulting from so singular an accident I did not get a chance to continue my inquiries, and returned at a more propitious time to get information.—H. C. Haner in The Wood-Worker.

WOOD PULP DEPARTMENT

PULP WOOD FORESTS OF ONTARIO.

As the result of a recent exploration made under the direction of the Crown Lands Department of Ontario, it has been ascertained that there exists an immense area of territory in the northern part of the province on which there is almost unlimited quantities of pulp wood. It consists of a tract stretching from the Quebec boundary west across the districts of Nipissing, Algoma and Thunder Bay, and comprising an area of about 24,500 square miles, or 15,680,000 acres. The region is watered by the Moose river and its tributaries, the Abitibi, Mettgami and Missinable, and by the Albany and its tributaries, the Kenogami and Ogoke. The principal pulp wood forests are north of the ridge, extending across the districts of Nipissing, Algoma and Thunder Bay. The timber embraces all the common pulp woods, such as spruce, poplar, and jack pine, as well as tamarac and cedar. It is generally of good quality, and ranges in size up to three feet in diameter. It is estimated that there is 3,000,000,000 feet of pulp wood in the new territory.

PULP MAKING IN NOVA SCOTIA.

A history of pulp making in the province of Nova Scotia is published in a recent issue of the Halifax Herald, the author being Mr. R. R. McLeod. Among other things he says :

"The first wood pulp mill in the Maritime Provinces was erected at Penobsquis, N. B., in 1870 or 1871, under the superintendence of Daniel Hughes. In connection with it was a paper mill. This concern was a failure, due to heavy transportation charges. Paper was manufactured in Nova Scotia in 1837, perhaps a little earlier. Near Bedford was a small mill, operated by Keswick & Sons, who afterwards built a large one in that vicinity. In 1872 Daniel Hughes & Sons purchased the property and operated it successfully till its destruction by fire. The next mill was built at Ellerhouse by a German of that name, who also had a paper mill in connection with it. This was burnt, and after a considerable delay was rebuilt and is now in operation by Mr. Hart. In 1880 a Halifax company built a pulp mill at Mill Village, Queens. That has been in continuous operation, and is owned by the Nova Scotia Wood Pulp Company. Next in order was a small mill at Sheet Harbor, built by H. McC. Hart, using a Hughes & Horton grinder on slabs. After running a few years the concern went out of business there. In 1893 three new mills were built—one at Sissiboo, Digby, by an American company ; one at Morgan's Falls, Lunenburg, built by A. G. Jones & Co., in conjunction with John S. and Joseph Hughes ; one at Milton, Queens, by the Milton Pulp Company, organized by A. G. Jones & Co. Afterwards was organized the Acadia Pulp and Paper Mills Company, Limited. The list of officials is as follows : President, Hon. A. G. Jones ; vice-president, John F. Stairs ; managing director and secretary, Walter G. Jones ; directors, Geo. E. Pomeroy, R. E. Harris, M. Dyer, A. E. Jones, John Duffus, W. N. Wickwire, M.D., Wm. Chisholm.

"The property of this company consists of three pulp mills with a capacity of 150 tons of pulp per day in all, various large tracts of woodlands, several vessels and a steam tug. It is capitalized at $550,000. While no large dividends have been paid to the holders of common stock, still the prospect is excellent now that the mills are in successful operation. Thus far there has been a great absorption of the profits in purchasing lands and building the new mill that will bear a description somewhat in detail. It is situated in the village of Milton, at Cowie's Falls, and has been built from plans and estimates of John S. Hughes, and under his superintendence, assisted by his brother, Joseph S. Hughes, the manager of the Morgan's Falls mill. This new mill at Milton is built on an excellent site. The main dam is 400 feet in length, 40 feet wide at the base, and 8 feet at the top, and 20 feet in height. This structure was designed by John S. Hughes, and is in some features new to that section. Five to six thousand horse power can be developed. The mill is a substantial and appropriate structure, built by Jason McLeod, of Milton, who also set the water wheels and placed the machinery. The mill is fitted for three pairs of Smith & McCormick wheels, 36 inches in diameter. Two are now installed, also one 24-inch and one 22-inch wheels.

The Morgan's Falls mill is provided with the same make of water wheels. The upper mill at Milton is equipped with two pairs of these wheels, 33 inches in diameter, and one line of three turbines 36 inches in diameter, and other wheels generating 3,000 horse power. The product of these three mills is 150 tons of wet pulp per day. It requires 1⅛ cords of good spruce to make 1 ton of pulp. This wood costs on an average $3.60 per cord at the mills. A short line of railway connects the mills with the port of Liverpool. The company gives employment to nearly 200 men at the mills, and the wages range from $1 to $2.25 per day

"The supply of wood is mainly derived from drives that are brought down the river and from the company's lands near the western shore, whence it is brought to Liverpool by vessels and barges. From the output of the upper mill during the first two weeks in February there were shipped 2,412 tons of pulp in thirteen vessels, and landed by them in Port Medway and Halifax, and from these ports it will be shipped to England.

There is some chronic grumbling because the spruce trees are being ground into pulp instead of sawed into logs. The fact is that 1,000 feet of spruce logs made into pulp leaves twice as much money in the country as it does when shipped as lumber. A very large proportion of the pulp wood is of little or no value for any other purpose. It is too small for lumber and not accessible for fencing. As a rule the thick growths of small spruce and fir on our low grounds do not reach the dimensions of saw logs, owing to causes I need not discuss. The pulp industry is a great source of prosperity to our people, and it will increase to much larger dimensions as the natural facilities become better known. On the Medway River, at Queens, are about 40 miles square of green soft wood forests, admirably adopted to pulp purposes, and the water powers could be united by electrical transmission over some 15 miles of the river above Brookfield, and made to turn the wheels and grinders of a large mill at Brookfield. A railway is the indispensable requisite for this enter-

prise. Other portions of the province offer openings for this industry.

PULP NOTES.

Mr. Robert S. Hall has been appointed manager of the Riordan Paper Mills at Merriton, Ont.

Mr. W. H. Parr, C.E., of Vancouver, B.C., has lately returned from a trip up north, where he surveyed a site for a pulp mill near Bella Coola.

The John Bertram & Sons Company, of Dundas, Ont., have been incorporated, with a capital of $300,000, to manufacture pulp and paper machinery, tools, etc.

It is reported that a large pulp company is negotiating for the purchase of the timber owned by the Chappell Lumber Company in Hants County, near Windsor, Nova Scotia.

The Brompton Pulp & Paper Company seems likely to proceed with the building of pulp and paper mills at Brompton Falls, Que. A Mr. Wilson, of Lewiston, Me., is one of the interested parties.

Messrs. A. T. Mohr and J. B. Scovell, of Buffalo, and J. W. Munro, M.P.P., North Renfrew, waited on the Ontario Government a few days ago in respect to the establishment of a pulp mill at Petawawa.

The Spanish River Pulp & Paper Company have let the contract for building pulp and paper mills at Webbwood, Ont., to J. W. Munro, M.P.P., of Pembroke, the contract price being about $200,000. The work of construction is expected to start almost immediately.

There are in Germany, according to a correspondent, 601 wood pulp mills, the annual value of the raw material for which is estimated at about $5,000,000. It is contended that conditions for pulp manufacturing are less favorable in Germany than in other countries, and a higher import duty is advocated.

The bill to incorporate the Ottawa & Hull Power and Manufacturing Company has passed the Private Bills Committee of the Dominion Parliament. The incorporators include W. C. Edwards, M.P., Hiram Robinson and H. K. Egan, and the company is empowered to develop electric power and to operate saw and pulp mills, etc. It is proposed to build a pulp mill at Chaudiere, Ottawa.

Negotiations are said to have been completed between the Quebec government and a party of New York capitalists which will result in the erection of immense pulp and paper mills on the upper Saguenay, at a point known as the Grand Discharge of Lake St. John. The water power is said to be almost unlimited, and we are told that about $4,000,000 will be expended on the undertaking, and that the mills will be more than double in capacity those at Grand Mere.

During the year ended June 30th, 1900, Canada exported $905,752 worth of pulp wood, of which $864,077 went to the United States. Ontario exported 50 per cent. more pulp wood than in the previous year, while the export of Quebec was about equal to that of 1899. Of the exports of wood pulp during the year under consideration, amounting to $1,816,016, nearly $1,200,000 worth was shipped to the United States. The wood pulp exports increased, as in the case of pulp wood, nearly 50 per cent. during the year.

Charles E. Eaton, chief engineer of the Sissiboo Pulp & Paper Company, of Weymouth, N. S., states that after years of experience with the Dexter Sulphite Pulp & Paper Company, of Dexter, N.Y., and in the construction of the Chicoutimi mills at Grand Mere, Que., he is of the opinion that pulp can be produced as cheaply in Nova Scotia as any other place in the world. The new mill at Weymouth Falls will start with a daily output of 30 tons of dry pulp. The dam constructed at Weymouth in connection with the mill is one of the largest in the Dominion, being 74 feet broad at its base, 450 feet long and 60 feet high, the construction of which took 1,000,000 feet of timber, 20 tons of iron, and 1,900 cubic yards of stone. The steel flume from the dam to the mill is 200 feet long and 15 feet in diameter. Three miles away, at Sissiboo Falls, a second mill of 20 tons daily capacity has lately been entirely reconstructed by the Sissiboo Pulp and Paper Company, of which Charles Burrill is managing director.

HUBBARD'S FULL CONCAVE.

THE KEEWATIN POWER COMPANY.

In the closing days of the Ontario Legislature an agreement was ratified granting certain concessions to the Keewatin Power Company. The company is the owner of Tunnel Island, in the Lake of the Woods, where it has expended upwards of $500,000 in a water power on the Winnipeg River, and intends to construct extensive pulp and paper mills, at a cost of $1,500,000, which it will operate, to give an annual output of 40,000 tons, employing at least 500 hands. Half a million must be spent, according to the agreement, within a year, and the whole million and a half within three years. In consideration of this expenditure the Government grants the right for a period of twenty-one years, to cut spruce, poplar, or whitewood and banksian or jackpine to enable the company to work its mills to their full capacity along the rivers and streams tributary to the Lake of the Woods, other than the Rainy River. The company may select sixty square miles of land from this territory, upon which is to be found the woods aforesaid, and it shall pay forty cents per cord of 128 cubic feet for spruce and 10 cents per cord for the other woods. Only the right to cut wood is thus sold to the company. The following gentlemen constitute the company: Richard Fuller, of Hamilton; John Mather, Alex. Fraser, of Ottawa; Wm. Gibson, of Beamsville; Henry Newell Bate, David McLaren, of Ottawa; Alex. McLaren, of Buckingham, Quebec; Henry K. Egan, Newell Bate, of Ottawa; Thomas Bate, of St. Catharines; Robert A. Mather, of Keewatin; Wm. H. Brouse, of Toronto; John B. Fraser, Ottawa.

THE LEFFEL AND VULCAN TURBINES

possess DISTINCTIVE MERITS which should have the attention of water power owners 1st—They are strongly and carefully built. 2nd—They are economical in their use of water. 3rd—They develop more power in proportion to the water used than any other Turbine built.

Mr. J. D. Flavelle, of the Flavelle Milling Co., of Lindsay, writes us under date of March 7th as follows :

> " Referring to the two 74" water wheels (Leffels) purchased from you during the past year. As far as we have had an opportunity of testing, they have done their work excellently, in fact are doing more than you guaranteed them for. We took a test of the power they were developing with a head of water of 3 ft. 10 in., and they developed very close to 100 h. p. We are thoroughly satisfied with same."

This letter is but one of many such.

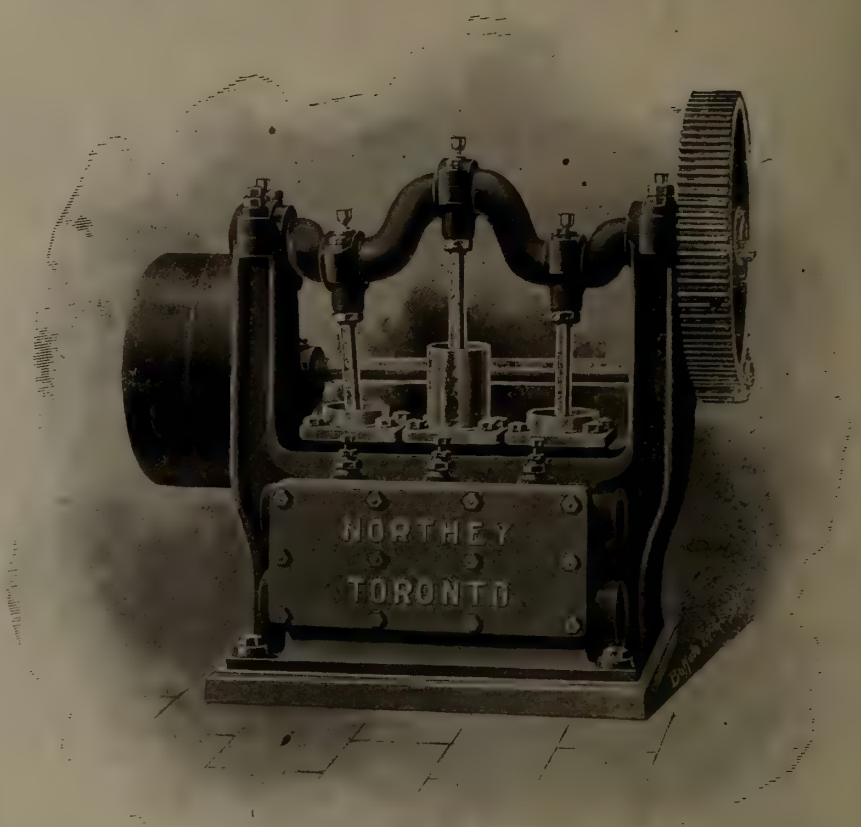
Northey Triplex Power Pump

FOR BOILER FEEDING AND GENERAL PRESSURE PURPOSES

In the Northey Triplex Power Pump we offer a machine put together with the skill brought by years of experience in pump building, and with full provision made for the varied demands likely to be made upon a pump of this character. A feature of value is that the three cranks are placed 120 degrees apart, thus giving a practically constant flow of water—minimizing strain on pump and economizing power. The pump can be readily repacked and taken up, and all details are carefully worked out. It can be conveniently operated by electricity, by water power, or by belt from engine. Different styles and sizes made to suit all duties.

WE ARE MANUFACTURERS OF OVER FIVE HUNDRED DIFFERENT STYLES AND VARIETIES OF STEAM AND POWER PUMPS FOR STATIONARY AND MARINE PURPOSES. WE INVITE ENQUIRIES FROM ENGINEERS, MINE SUPERINTENDENTS AND OTHERS FOR THEIR REQUIREMENTS IN OUR LINE. CATALOGUES AND SPECIFICATIONS FURNISHED UPON REQUEST.



We are also manufacturers of the Northey Gas and Gasoline Engine, which has proved to be the handiest and most convenient power for small or intermittent power users in the market. Suitable for machine shops, pumping and electric light plants, etc. Write for illustrated descriptive booklet.

VOLUME XXI. NUMBER 6. | TORONTO, CANADA, JUNE, 1901 | TERMS, $1.00 PER YEAR Single Copies, 10 Cents

MR. J. C. LANGELIER.

Mr. J.C. Langelier, who fills the important position of Superintendent of Forest Rangers in the Province of Quebec, is one of the ablest and most versatile of the representatives of a family who have won distinction in the province by their great abilities and eminent public services. He is a brother of Hon. Francois Langelier, now a Judge of the Quebec Superior Court, whose name figured so prominently for many years in the politics of Quebec, both Provincial and Federal, as a Cabinet Minister, as a member of the Provincial Assembly and the House of Commons, and as one of the leaders of his party in the Quebec district; also of Hon. Chas. Langelier, now M.P.P. for Levis, who was Provincial Secretary in the Mercier Administration, and who is still one of the most conspicuous figures in Quebec public life.

The subject of our sketch was born at St. Rosalie, County of Bagot, P.Q., in 1845, so that he is now in his fifty-sixth year; yet he is still as active and vigorous and as ready to face any exposure and hardship as most men at thirty. A perfect colossus in size, he towers physically as much as he does mentally above his fellows. Educated at the College of St. Hyacinthe, P. Q., where he went through a complete classical course, he studied law at Laval and Victoria Universit es, and was admitted to the Provincial Bar in 1870, but never practised his profession, as his tastes ran rather in the literary groove. He preferred the pen and the atmosphere of the editorial sanctum to the atmosphere of the law courts. He accordingly took up journalism and sucuccessfully as well as successively, edited Le Courrier de St. Hyacinthe, La Nation, Le Canadien, etc., besides acting as a frequent contributor to the columns of L'Election, Le Soleil and other well known and influential French newspapers published in the province; in fact, he soon became a power in the press, as well as by his readiness and force as a writer as by his wonderful knowledge of all the facts and information that bore on the questions of the day, and by his untiring energy and industry.

Mr. Langelier's pen has also been as prolific as it is versatile. He has published a great many valuable pamphlets on agriculture, colonization, railways and the sources generally of the Province of Quebec and of the Dominion. His sketch of the Province of Quebec, published for the Administration of the then Premier of Quebec, the late Hon. H. Mercier, is still deservedly regarded as the most complete compendum of statistical and other useful information relative to the province, its population, industries and resources of all kinds. And the same praise may be extended to his sketches of the Gaspe district, the Lake St. John country and the northern regions of Quebec stretching to James Bay, which remain the best yet published in regard to those parts of the province. Indeed, it may be said with great truth that he knows every nook and cranny of his native province. Certainly none are better acquainted with its forests, water powers and lumber trade, and none better deserve the nickname of the "walking encyclopedia" which his friends have applied to him. A recent contribution of much value was a paper on "The Pulp Industry in Relation to our Forests," read before the Canadian Forestry Association and published in the April issue of this journal.

Yet Mr. Langelier is a most unassuming and unaspiring man. Like his brothers, he might have entered the Legislature or Parliament, but he has repeatedly refused to become a candidate for public honors, and notably so for Bonaventure County in 1890. From 1887 to 1892, he filled the important office of Deputy Provincial Registrar, and it was while occupying this position that he compiled and published the "Description of the Surveyed Townships of the Province of Quebec," which is one of the most useful of the official blue-books of the province, embracing as it does the most precious information regarding all the surveys and explorations made there down to 1890. In 1897 he was appointed Superintendent of the Forest Rangers of the Province, and in that capacity has displayed his usual ability, vigor and activity, besides carrying out a number of reforms, which have largely contributed to Premier

MR. J. C. LANGELIER.
Superintendent Forest Rangers, Province of Quebec.

Parent's successful administration of the Department of Lands, Forests and Fisheries. It may be added that Mr. Langelier is also an expert in all matters relating to the pulp industry, to which he has given a powerful impetus by his reports to the Department and his writings in the press.

ACCIDENTS IN WOOD-WORKING FACTORIES.

The Inspector of Factories for Ontario, reporting on the accidents during 1900, states that of those recorded the wood-working industries were responsible for 68, as follows: By saws, circular mostly, 25; sticks thrown by saws and planers, 2; planers, jointers, and shapers, 29; veneer cutter, 1; heading machine bursting, 4; embossing machine, 2; fell into mill gearing, 1 (fatal); drawn in and held against a saw, 1 (fatal), and falling off a lumber pile, 2.

The Inspector says: Saws and planers of different kinds account for nearly all the accidents in this industry, and I have no doubt but that those happening from these machines can be reduced in some measure by proper guarding; but it is difficult to get some employers to see that these machines can to a considerable extent be provided with guards that will prevent many of the accidents from occurring, though I am still to be convinced that all saws and planers of different kinds can be so guarded that accidents would be impossible. Some employers have told me that they have provided such guards, but their employees soon quit using them. Others have told me that they will discharge any employee who uses a circular saw without the saw guard, and have therefore no difficulty in having them kept in use. One of these is a large furniture manufactory, which has not reported an accident for over ten years, simply because none have occurred. In the large woodworking factories having several circular saw machines, each for different work, it is not difficult to guard them, but in factories not so well equipped with saws, and each saw having to do a greater variety of work, with different thicknesses of lumber—and the guards having to be adjusted to that work, which means trouble and more loss of time—the workmen, as a rule, do not favor guards, and the employer does not insist on their use. Some employers take the ground that the time lost in changing a saw guard is a valid objection to its use, and would be held in law as impracticable, as the law only requires protection when it is practicable to give it. An employer may take the risk and do without the guards; but if there is an action for compensation for injuries received from an unguarded machine, and his defence is that it was impracticable to guard it, he must bear in mind that the plaintiff may produce evidence to show that similar machines doing similar work in another factory are guarded, and the plea of impracticability would be of little avail. Then as to buzz planers and jointers, one can cover the gap over the knives, all except just so much space as will permit the timber to come in contact with the knives, which has to remain uncovered, and that is where the danger is, or in putting through a tapering stick like a waggon tongue, the gap must be uncovered enough to allow the widest part of the wood to pass over the knives, which are exposed when the narrow part of the stick is going over the gap. I have known of cases where men have lost fingers in planers when the knives are covered all except one inch to allow an inch stick to pass over; they simply dropped their fingers into that exposed inch of the knives. There is a device made of thin board, the shape of a pear, with the small end fastened to the bed of the planer, the body presses against it and causes it to follow up the pieces of wood passing over the knives, so that the gap is never uncovered. These are in use in three or four furniture factories in Berlin and Waterloo, but I think they are of doubtful utility. Two accidents happened from slivers or sticks being thrown from a saw. These cannot always be avoided. The embossing machine is not a dangerous one, still there were two accidents reported as happening from them, one of which happened to a man reaching over, his shirt took fire from the gas flame for heating the embossing roll. One happened (fatal) in a saw mill, a foreman was killed, no one saw the occurrence, but it is supposed he was walking on a beam and fell off, striking the shafting, or his clothing was caught in the shafting, which revolves rapidly.

—Steinhoff & Gordon have decided not to rebuild their stave mill at Wallaceburg, Ont.

A BOOK-KEEPING SYSTEM FOR A WHOLESALE OR RETAIL LUMBER YARD AND PLANING MILL.

By S. A. ULLMAN.

Cash Book, Journal Ledger, Sales Book, Contract Record, Freight Book, and Bill copying book are the books used.

In some enterprises of this character separate sets of books are kept for the mill and for the yard; but from the query in "Home Study" I do not understand that separate sets are required.

Sales in this line are mostly time sales, and in contract form. The builder comes to the yard or mill with his list of timber or mill work and asks for a figure, generally giving copies of his list to all competitors in the vicinity. The list is copied carefully into the contract register (an ordinary ruled record book) with the material which will come from the yard and that which will come from the mill separate. A figure being given the builder, say $1,000, for the entire list, the price, if acceptable, is noted on the page of the contract register, with the date sold, purchaser's name and address, manner of delivery, tèrms, etc.

The sales book is a book of consecutively numbered tickets, original duplicate and triplicate. The original and duplicatè tickets are taken by the teamster with each delivery. The customer keeps the duplicates and receipts for the load on the original, which is returned by the teamster and the day's receipted original tickets are posted back in the sales book opposite the triplicate ticket bearing the same number. In case of dispute reference can always be had at once to the original ticket, which is a receipt for the goods. The sales book is made a little wider than the tickets, allowing room for two money columns. Tickets are made out by the shipping clerks; one for every shipment on account of a contract, and for cash sales as well, but in the latter case the ticket is stamped "paid" and the amount is not extended into the outer column. The footing of the outer column gives total time sales for the day or month, and the cash register the daily total of cash sales. Posting is done direct from each triplicate ticket to the customer's account, the ledger folio being entered on each ticket as posted. Cash tickets, of course, are not posted. The monthly footing is posted to the credit of sales account. Two such sales books, one Tuesday, Thursday, Saturday, and the other, Monday, Wednesday, Friday, should be used, which will allow the book keeper to post the previous day's work without interruption. Frequently the total amount on tickets posted to a customer's contract account does not agree with amount of the contract, but as this discrepancy arises from the variation, in pricing on the various sales tickets and in the contract register (owing to the inability to tell exactly what the mill work would cost), it is disposed of by charging the contract account and crediting sales account, or vice versa, through the journal, with the explanation "under (or over) pricing on sales tickets," accordingly as the total of the tickets charged by the customer's contract account is less or more than the amount of contract. It is best to keep each of a customer's contract accounts separate from his running account As each contract is completed the balance of the contract account is transferred by journal entry to the customer's running account.

"John Smith"..... ....$1,000
"John Smith, Vernon Ave. yard and mill contract. Contract completed".....$1,000

If the contract accounts were not kept separate from a customer's running accounts, the balance shown on his monthly statement would contain items on account of contracts which would not be due until the contracts were completed, perhaps not for several months.

The cash book should have four columns on each side.

The first column for charges and credits to custoers' accounts.

The second column for charges and credits to creditors' account.

The third column for charges and credits to real, nominal, special and controlling accounts.

The fourth column for charges and credits to expense account.

In this line there are many daily charges and credits to expense account, and by allowing a special column for expense it is only necessary to post the total of this column at the end of the month.

The totals of customers' and creditors' columns are posted monthly to sundry customers, controlling account and "sundry creditors, controlling account," thus enabling a balance of the ledger to be made, excluding the individual accounts of customers and creditors, and permitting the proprietor to ascertain his condition before the numerous postings to customers' and creditors' accounts are completed, if desired; and the balances of individual, customers' and creditors' accounts when taken off are known to be correct if they tally with the balances of the controlling accounts.

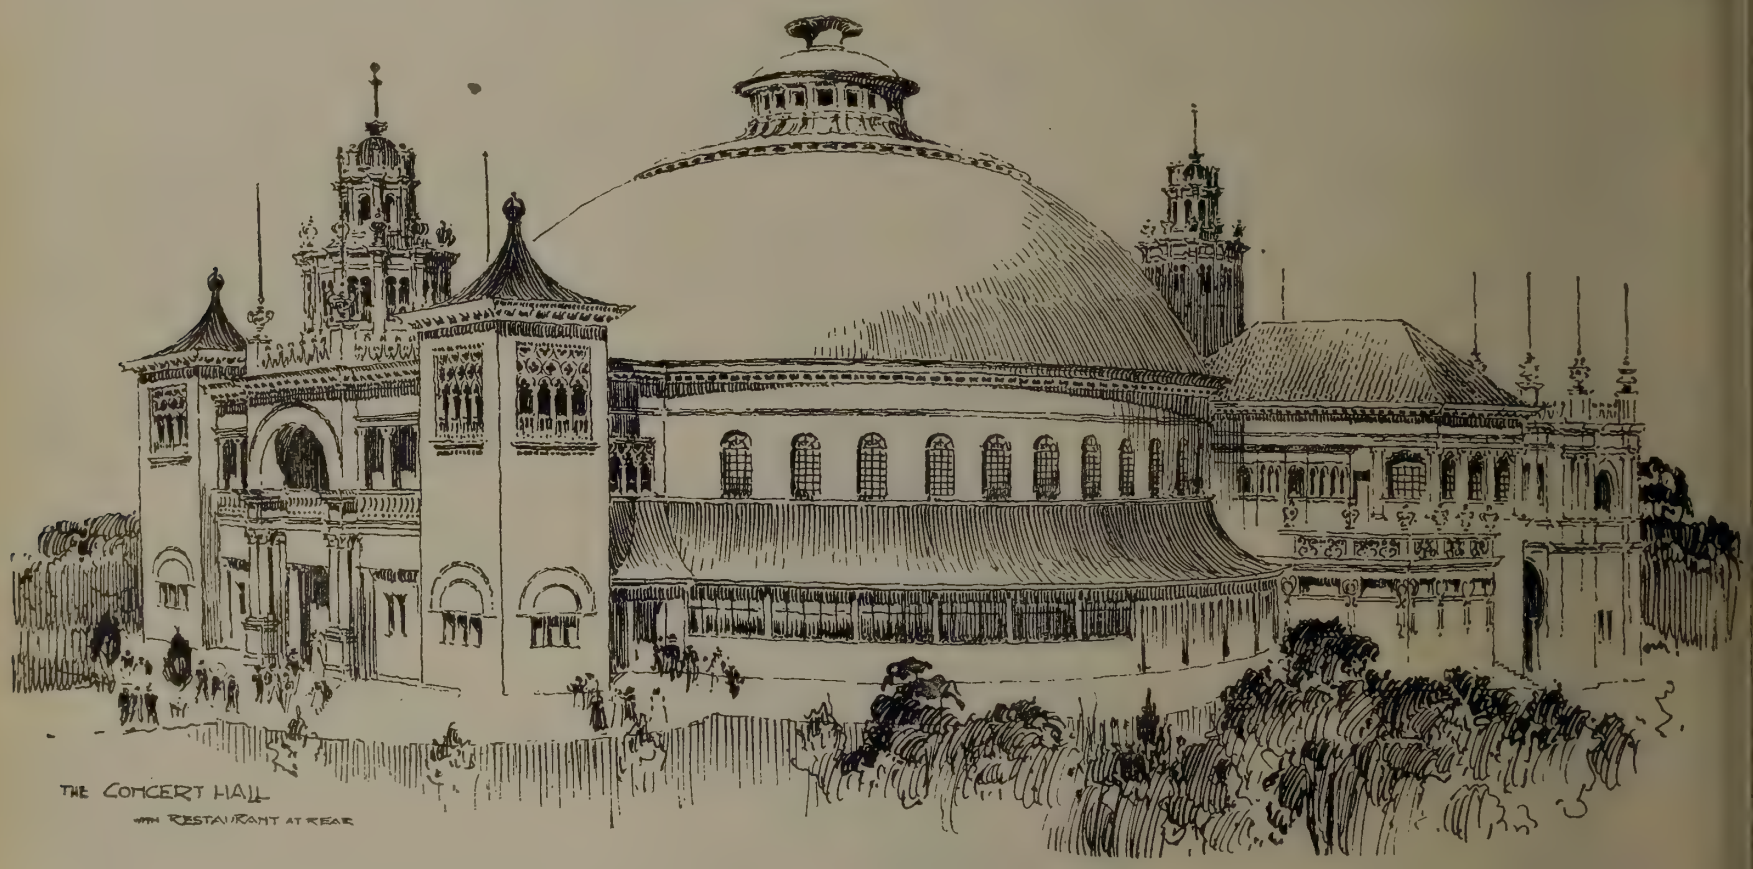
The total of cash sales as shown by the cash register, and as proven by the total of cash sales tickets, is entered daily in the cash book, and the difference between the sum of the totals of the four columns on each side of the cash book, plus the bank balance and the cash on hand, should balance the cash book.

When notice of the arrival of a carload of timber is received the particulars should be entered in the freight book, and the shipper's account charged with the amount of the freight when same is paid—provided such are the terms of purchase. When invoices are received and checked they should be posted direct to the creditors' and purchase accounts, marked with ledger folios, and filed ahead in calendar file to date when payment should be made. When paid they are filed away alphabetically. If voucher system of payments is used the invoice should be first posted to a voucher form, and then treated as above, except that opposite payment in cash book in red ink should be written the voucher number, and when paid invoices are filed under voucher numbers and indexed under creditor's name.

In posting from sales tickets to customers' accounts, the referring number should be the ticket number and not the page of sale book.

The sales tickets for each day should be billed the following day and the bills kept in a blotter portfolio, having a page to each letter of the alphabet, and each day's charges added on the bills so that at the end of the month only the last day's items need be added, and the bills and statements can be in the customer's hand on the first of thè month.

A carbon copy or letter press copy should be kept of all bills.—The Book-Keeper.



GLASGOW EXHIBITION BUILDINGS—CONCERT HALL.

—The plant of the Walkerville Match Company at Walkerville, Ont., was almost totally destroyed by fire last month. The box and basket factories were saved. The loss is in the neighborhood of $100,000.

IMPORTANT LEGAL DECISION AFFECTING LUMBERMEN.

The Rathbun Company, Applicants; The Longford Lumber Company, Respondents--This case was heard in the County Court of the County of Victoria, and was an application under the Rivers and Streams' Act to fix the tolls on South Creek in the district of Haliburton. The judgment is as follows :

In the matter of the Act for Protecting the Public Interest in Rivers, Streams, and Creeks, and in the matter of an application to fix the tolls on South Creek, in the Provisional County of Haliburton.

The Rathbun Company are the Applicants and the Longford Lumber Company are the Respondents. The first named Company is the holder of a timber license for the northwesterly portion of the township of McClintock, in the said provisional county, and the last named company of the southeasterly part of said township.

A small rivulet or creek named South Creek takes its rise in what is described in the evidence as the big marsh in said township, and running through the lands of both the above named companies for a distance of about seven miles, empties into Ox-Tongue Lake, also in said township. About the first day of October, 1898, the Rathbun Company, in order to bring the pine timber on their limit adjacent to South Creek into market, commenced the improvement of that stream so as to make it floatable for logs and timber, and it was admitted that up to the first of March, 1899, they had expended the sum of $2,994.12 in building dams, slides and other improvements of a like nature on said stream. The Rathbun Company after their experience in driving their logs and timber on South Creek during the spring of 1899, deemed it necessary that further improvements should be made to enable them to run out the balance of their pine timber adjacent to the said creek, and it was admitted that they had expended for such improvements $2,539.20 between the month of August, 1899, and the 24th day of December following. There appears to have been some correspondence between the above mentioned companies about the landing of the logs of the Longford Company on the banks of South Creek during the winter of 1899 and 1900, and it was conceded that the last mentioned company had refrained during that season from landing their logs on said creek at the request of the Rathbun Company. It is admitted that the Rathbun Company have driven out of said South Creek 8,500,000 ft. B. M. of logs and timber, and that they have no further use for their improvements on said creek. It is further admitted that rough timber of the value of $100 belonging to said company was used in said improvements and not included in above mentioned sums.

The Longford Lumber Company during the season of 1900 and 1901 have cut and landed 4 and a quarter million ft. B. M. on the banks of South Creek and are now using the improvements of the Rathbun Company on said creek for running or driving their said logs and timber, and they allege that in order to make the said improvements useful for their purposes they were obliged to expend $1,150 in extending said improvements, adding thereto and in repairing same. It was further admitted that the above mentioned quantity was all the logs and timber that the said company would bring down said creek, and that after they finished driving out their present year's cut the improvements will not be of any further use to the said company.

On the 27th day of March last an application was made on the affidavit of the solicitor of the Rathbun Company to issue an order and appointment to settle the tolls to be paid by the Longford Lumber Company to the said Rathbun Company for the use of their improvements on said South Creek. An order and appointment was issued by me fixing the 12th day of April last to proceed with the enquiry and settle the amount of said tolls, and by the said order and appointment I directed a copy of said order and appointment to be served upon the Longfard Lumber Company on or before the 5th day of April last, and that a copy thereof should be published once in the Canada Lumberman. The appointment having been adjourned until the 19th day of April last on the application of the Respondents Company, the matter came on for hearing before me on that day in presence of counsel for the Applicants, and Respondents' proof having been given of the insertion of a copy of the said order and appointment in the Canada Lumberman as directed, I proceeded with the examination of witnesses and hearing on that day and on the 30th day of April last.

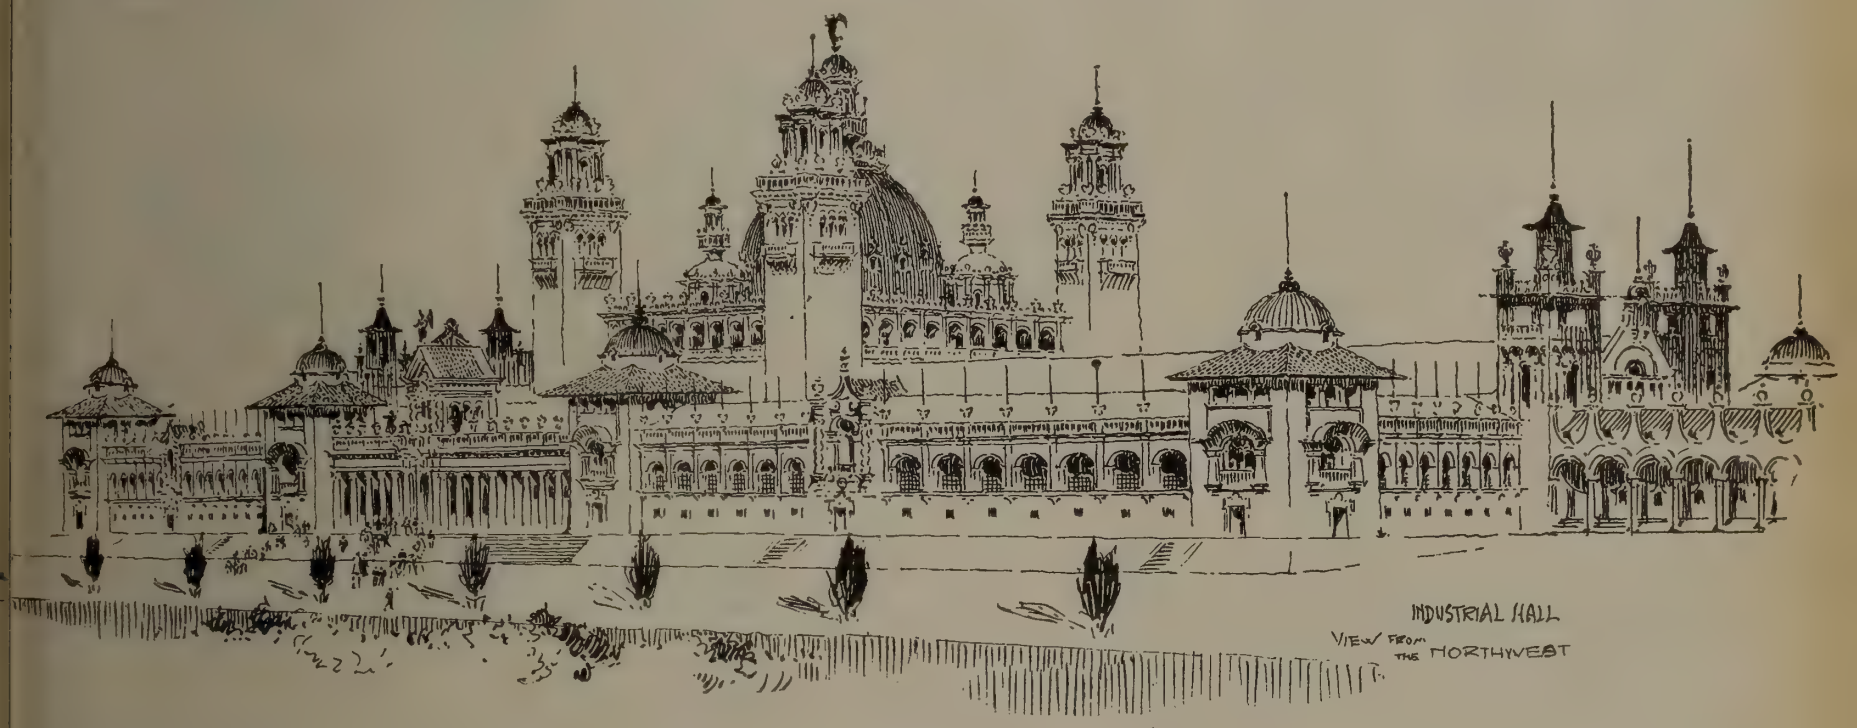
The matter was argued at length before me, Mr. McLaughlin and Mr. F. E. Hodgins, of the Toronto Bar, for the Applicants, and Mr. Stewart for the Respondents.

The learned counsel for the Applicants claimed that the following accounts and allowances should be credited to the said company's improvements :

1st. The amount expended in 1898 and 1899 $2994.12
Interest thereon from date of Ex. to date of judgment..... ....
2nd. Amount expended in 1899 and 1900 $2539.20
Interest from date of Ex. to date of judgment..... .... 2539.20
3rd. Allowance for rough timber used in work above the value of rough timber taken from Respondent's lands... ..... 100.00
4th. Cost of clearing and burning brush near dams..... .... 200.00
5th. Costs and expenses of superintendent 217.50
6th. Allowance for time of book-keeper... 149.00
7th. Maintenance and repairs, including Jackson's dam..... .... 350.00
8th. Expenditure for fire ranging..... ..... 103.00
9th. Interest on items 3 to 9 from date of Expenditure until judgment..... ....

They also contended that the improvements should be divided into three sections as shown on Plan Ex. No. 3, and the tolls computed according to the quantity of timber and logs driven over each section by the respective companies. They further contended that the Respondents expenditure for improvements and repairs made on the works this spring in order to enable them to use the said South creek amounting to $1,150 should not be taken into account when fixing the tolls to be paid by said Respondents to the Applicants. They further contended that the improvements made by the Respondents were above the area of the improvements made by the Applicants. They further contended that under the last clause of Section 13, Cap. 142, R.S.O. 1897, the Applicants were entitled to some further allowance for risk, and they ask for the costs of these proceedings, and referred to Cap. 76, Section 1, R.S.O., Sec. 14, Cap. 142 and Section 22, Cap. 143, R.S.O. 1897.

Counsel for the Respondent Company admitted that items Nos. 1 and 2 are properly taken into account, but contended that interest should not be allowed for the first and second year, as the Applicants were in the sole and exclusive use of the said improvements during those years; that item No. 3 above should not be charged in the account, as the rough timber used was of no commercial value, and that the action of the Applicants in not taking out the hemlock timber adjacent to the said creek after the improvements were all made proved that said timber was valueless; that no proper account was kept in the Applicants' books of the quantity of rough timber used in the construction of said improvements or of the particulars of items Nos. 4, 5, 6, 7, or 8, although it was proved that the Applicants' manager, Mr. Callaghan, instructed the bookkeeper to keep a particular account of those improvements, as the Respondent Company would be liable to pay a portion of the cost; that the and 2 above and claiming no interest or any Applicants served a statement on the Respondents showing their total expenditure on said improvements to be $5,533.32, comprising items Nos. 1 further payment or allowances; that Applicants cannot be permitted to extend their claim beyond the said statement or in any event beyond the items of claim mentioned in their affidavit of claim filed herein; that no allowance beyond



GLASGOW EXHIBITION BUILDINGS—INDUSTRIAL HALL.

those mentioned in Section 13, Cap. 142, R.S.O., can be taken into account in fixing the tolls; that the improvements on South creek from the reservoir dam to Ox-Tongue Lake are an undivided whole and cannot be arbitrarily divided up into sections at the will of the Applicants, and that it is quite impossible to say that one section is more essential than another to the floatability of the stream; that in order that the Respondent Company could use the said improvements for the transmission of their logs and timber over the said improvements it was necessary for them to expend $1,150 on repairs and improvements thereon within the area of said improvements; that the total costs of the improvements should be divided between the said companies on the basis of the quantity of timber driven out of said stream and over said improvements; that as the Respondents having one-half the quantity of timber to run over said improvements that the Applicants have already run out, that a sum per 1000 ft. B.M. should be allotted or fixed to the paid by the Respondents' Company to the Applicants to cover one-third of the total cost of such improvements.

The Applicants' counsel in answer contended: — That their claim being founded on a Statute cannot be enlarged or abridged by the intention of the parties; that the logs and timber of the Respondents being situate on the easterly part of the township of McClintock, and further from Ox-Tongue Lake, the Respondent Company required to use more of said improvements than the Applicants in driving or floating out their logs and timber.

In order to arrive at a proper sum to be fixed as a toll to be paid by the Respondents Company to the Applicants, for the use of their constructions and improvements on South Creek, it will be necessary under Section 13 of Cap. 142, R.S.O. that the following matters or items be taken into consideration.

1st. The original cost of the construction and improvements.

2nd. The amount required to maintain the same.

3rd. Interest upon said original cost.

4th. Such other matters as under all the circumstances may seem just and reasonable.

There is no difficulty in dealing with the matters under the first and second and third of those items, but more difficulty arises in the application of the fourth item. I cannot accept the Applicants' contention that under this clause I am at liberty to divide the constructions and improvements into sections and assign different tolls to the different sections according to the amount of saw logs and timber floated or transmitted through or over each of such sections by the respective parties. I find the improvements on South Creek from the reservoir dam to the outlet into Ox-Tongue Lake, one series of improvements; nevertheless I consider the use made of the said constructions and improvements by the respective parties as important element to be taken into consideration in fixing the tolls to be paid to the Applicants' Company in this case; neither can I take into consideration on this application the sum expended by the Respondents in increasing the efficiency of said improvements for their own convenience in 1901.

In computing the original cost to the Applicants of the constructions and improvements on South Creek I allow items Nos. 1, 2, 3, 4, 5, and 7 and $100 of item No. 6, and I reject item No. 8, as I consider. fire ranging as neither part of the original cost or a proper charge for maintenance, although a proper precautionary measure taken in their own interest in connection with their timber limits. The charge for the bookkeeper's time was not as clearly shown as such an item should have been, and I think $100 quite enough to allow.

'I summarize the original cost, maintenance and interest as follows: —

Amount expended to March 1st, 18999... ...	$3144 12
Interest thereon to May 7th, 1901, 2 years and 66 days.....	411 38
Amount expended to December 24th, 1899...	3006 70
Interest thereon to May 7th, 1901, I year and 134 days.....	246 57
Maintenance and repairs.....	350 00
Total original cost, maintenance and int.	$7158.77

Having considered the fact that the greater portion of the saw logs and timber of the Respondents will require to be floated or transmitted through or over the whole of the constructions and improvements on South Creek from the reservoir dam to Ox-Tongue Lake, whilst a comparatively small portion of the said Applicants' saw logs and timber was floated or transmitted over the whole of the said improvements, I find that three-fifths of said above mentioned sum of $7,158.77 should be borne by the Applicants, and two-fifths by the Respondents.

I therefore order and adjudge that the Respondent Company pay to the Applicant Company 66 and one-seventh cents per thousand feet board measure of their saw logs and timber floated or transmitted through and over the said constructions and improvements on South Creek as and for tolls, and I fix the said tolls at 66 and one-seventh cents per thousand feet board measure of saw logs and timber, as provided by Section 13 of Cap. 142, R.S.O. 1897.

I find that the said constructions and improvements will not be of use to any other persons than the said Applicants and Respondents.

I think the costs should be divided equally between the parties, and if the parties desire they can speak of the question of costs later.

Dated this 7th day of May, A.D., 1901.

(Signed) JOHN E. HARDING,
Judge.

A RETROSPECT OF THE TIMBER BUSINESS.

An unusually interesting article reviewing the development of the British timber trade, and giving much information regarding the import duties charged on lumber before the adoption of the present free trade policy of Great Britain is published in the last special number of the Timber Trades Journal, of London, England.

When the last century dawned there was a duty of 11s per load of 50 cubic feet levied on all European timber imported in the log into the United Kingdom. This was constantly raised until before the century was twenty years old it had increased to the enormous charge of £3 5s per load. This duty did not apply to timber from the British North American colonies, which was imported duty free till 1821, when a duty of 10s per load was decided upon.

The duty on imported timber, which was fixed at 6s 8d in 1787, was increased in the first instance for purposes of revenue, to meet the heavy demands on the country's purse of the French wars. The events which culminated in the destruction of the Danish fleet at Copenhagen having seriously affected the British relations with the Baltic powers, it was apprehended that a deficiency of their accustomed supply of timber might ensue, and the Government of the country, egged on by the shipping interest and the Canadian merchants, decided on the policy of bolstering up the timber industry in Canada, to the detriment of trade with the north of Europe. Thus the duty on timber was still further added to as a protectionist measure when a further increase had become detrimental rather than advantageous to the treasury.

In 1813, when the free navigation of the Baltic had been restored, the duty was again increased 25 per cent., and it was not until six years after the war was over, in 1821, that any attempt was made to reduce it. These burdensome duties. moreover, did not represent the whole of the charges made on imported timber, as there was always an additional duty payable on timber imported in foreign ships. When the duty on timber imported in British ships stood at 6s 8d, this extra charge only amounted to 2d, but it gradually increased with the increase of the regular charge until when the ordinary duty on imported timber was £3 5s that imported in foreign vessels had to pay 3s excess, or £3 8s per load.

When the duty on timber imported in the log was 6s 8d per load, the duty on deals under 20 feet in length was £2 13s per standard of 1,980 superficial feet. In 1801 it rose to £5 16s 9d, in 1809 to £8 15s, in 1810 it was doubled, and so on until it reached its maximum of £20 15s 5d in 1819. In 1821 the scale of dimensions was changed, when the charge on deals not exceeding 16 feet in length was fixed at £19, and that on deals from 16 feet to 21 feet at £22. The charge on Colonial deals was at this time £2 per standard, as against £19 for Baltic deals. The effects of the increase of the duties on timber and the preferential treatment accorded to the British colonies is well illustrated in the following table. For the sake of conciseness the average per annum is taken for the imports of every five years.

IMPORTS OF TIMBER INTO THE UNITED KINGDOM.

Five year periods.	From Baltic. Loads.	From Britis' Columbia. Loads.
1788-1792	219,396	2,660
1793-1797	164,600	1,225
1798-1802	178,019	2,916
1803-1807	232,477	16,533
1808-1812	73,718	120,537
1814-1818	125,855	147,507
1819-1823	116,600	335.556
1824-1828	191,890	410,903
1829-1833	122,783	412,682

So onerous did the duties on Eurouean timber at last become that it was no rare thing, in spite of the heavy freight of those days, to ship Baltic timber to the Colonies for the purpose of introducing it into England at Colonial rates. It was asserted that there had been a profit of ten shillings per load on one of these transactions, where the duties on Baltic timber were absolutely prohibitive of any profit at all. No reduction of the timber dues was carried out until 1842, when the duty on European wood imported into Great Britain was fixed at 32s for sawn and 24s for hewn wood. The duty on Canadian wood was at the same time reduced to the nominal amount of 1s and 2s. In 1847 the discriminating duty was reduced to 14s. Four years later the duty was fixed at 7s 6d per load on square timber and 10s per load on deals and battens from other than Colonial ports. In 1860 it was reduced to 1s and 2s per load, and in 1866 abolished altogether.

TIMBER PRICES.

There was a considerable rise in prices, as was to be expected, during the period of the French wars. The following table give the estimdted prices c. i. f. which were obtained for Quebec white pine deals from the recognized Canadian ports:

PRICES QUEBEC WHITE PINE DEALS, FIRST QUALITY, PER STANDARD:

1808....	£30 0	1817....	£17 2 6
1809....	43 0	1820....	13 0 0 to £16 0
1812....	26 0	1825....	16 0 0 " 19 0
1815....	33 0	1830....	14 0 0 " 16 10

The evidence given at the parliamentary commission of 1835 shows that Canadian red pine at that date brought £4 12s 6d per load of 50 cubic feet. But the net proceeds to the Canadian seller were only £1 12s 6d, as the gross profits were reduced by various charges to the extent of £3 before anything could be put into the seller's pocket. The charges on Canadian red pine were as follows: Duty 10s; freight, £2; Government charges, 3s; interest, 2s 4d; commission and brokerage, 4s 8d—(£3 in all.) Of Quebec white pine the selling price was £3 17s 6d, the total charges thereon amounting to £2 18s 10d, and the net proceeds therefor being 18s 8d.

The price of Quebec deals in 1835 was £14 10s per standard. The duty was £1; freight £6; charges, 9s 6d; interest 7s 3d; commission and bokerage, 14s 6d; total, &8 11s 3d. The net proceeds were therefore, £5 18s 9d per standard hundred.

THE FIRST MILLS.

It was not until the last half of the eighteenth

century that the saw mill came into general use in Great Britain. A saw mill was erected in England as early as 1663, but it was destroyed by the laboring classes, who bitterly resented its introduction. As late as 1767 there are records of saw mills destroyed through this popular prejudice. Probably the earliest description of a saw mill to be met with is that sent by the Ambassador from Mary, Queen of England, to the Court of Rome, which has reference to one then in use in the neighborhood of Lyons. It is perhaps worth while to quote it verbatim : "The saw mill," the ambassador writes, "is driven with an upright wheel, and the water which maketh it go is gathered whole into a narrow trough, which delivereth the same water to the wheel. This wheel hath a piece of timber put to the axletree and like the handle of a broach and fastened to the end of a saw, which being turned by the force of the water, hoisteth up and down the saw, that it continually cateth in, and the handle of the saw is kept in a rigall of wood from swerving. Also the timber lieth, as it were, upon a ladder which is brought by little and little to the saw with another vice."

It was in America that the saw mill when once introduced took the firmest root, as the vast extent of the forest that required clearing led to this kind of machinery being eagerly adopted and widely employed. The first saw mill of which there is any record was erected on Salmon Falls river, near the city of Portsmouth, N.H., be-

ONE OF THE FIRST SAW MILLS.

twèen the years 1631 and 1635. About 1650 they came into use in Virginia. The accompanying illustration of the mill first built there is reproduced from a tract published in London, in which is also found the following description :

"This engine is very common in Norway and mountains of Sweden, wherewith they cut great quantity of deal boards ; which engine is very necessary to be in a great town and forest, to cut timber, whether into planks or otherwise. This heer is not altogether like those of Norway; for they make the piece of timber approach the saws on certain wheels with teeth, but because of preparations which those toothed wheels are often subject unto, I will omit that use : and instead thereof, put two weights, about 2 or 300 pound weight a piece, whereof one is marked A and the other B. The cords wherewith the sayed weights do hang, to be fastened at the end of the 2 pieces of moving wood, which slide on two other pieces of fixed wood, by means of certain small pulleys, which should be within the house, and so the sayed weights should always draw the sayed pieces of moving wood, which advancing alway toward the saws, rising and falling, shall quickly be cut into 4, 5, or 6 pieces, as you shall please to put on saws, and placed at what distance you will have for the thickness of the planks or boards you will cut, and when a piece is cut, then let one with a lever turn a roller, whereto shall be fastened A I strong cord which shall bring back the sayed piece of wood, and lift again the weights ; and after put aside the piece already cut, to take again the saws against another piece of wood, which once done, the ingenious artist may easily convert the same to an instrument of threshing wheat, breaking of hemp or flax, and other as profitable uses."

Among the timber merchants doing business in England one hundred years ago appears the name of Irvin & Sellers, of Preston, Lancashire, and Bootle, Liverpool. This firm can boast of an unbroken success in one family for upwards of a century. Two years ago they celebrated their centenary, to commemorate Mr. John Irvin's commencement of business at Friargate in Preston as a manufactarer of shuttles in the year 1799.

PURCHASE OF MILL SITE.

Messrs. Geo. T. Houston & Co., hardwood lumber dealers of Chicago, have purchased 148 and a quarter acres in Vicksburg, Mississippi, as a mill site, paying therefor $23,125 cash. The tract fronts on Lake Centennial, corners on the National Cemetery, and is bordered by the Y. & M. V. R.R. Co.'s tracks. The proposed plant will include 4 band saw mills and numerous other gang and re-saws, including a number of veneer saws and woodstock factory connected with conveyors to consume low-gradè material and refuse. The company will employ from 500 to 800 men in their manufacturing and logging operations and will build a fleet of light draft, modern steamers and barges for towing and barging logs on the Yazo and Big Sunflower rivers.

The company will retain thèir big double band mill at Bigbee, which has made a record never before heard of. The mills were started on a night and day run January 10, 1899, about the time lumber began to boom, and has kept it up and is still running night and day, with a year's supply of logs ahead.

The company has recently secured additional stumpage near the Bigbee mill on Tombigbee river, known as the "Eikelberger Tract," amounting to 4800 acres, covered with a virgin forest of white oak, ash, cypress and poplar, and that, with their present holdings, will run the Bigbee mill a number of years.

The new plant to be built at Vicksburg will contain all new and modern machinery to be equipped with all the latest and most approvèd labor-saving appliances. Construction is to be commenced this coming fall, or probably sooner. To start with, a single band mill will be temporarily constructed at once, to saw out the material required for the construction of the new plant, which will take from 5 to 6 million feet of timber and lumber. The first floor of the mill proper will be of stone and brick ; the second and third floors frame, covered with galvanized iron, strictly fire proof. The factory building, power plant and machine shop will be constructed of brick, stone and iron, modern and of a permanent nature and likewise fire-proof. The power house will include two 1,000 horse power engines, with separate attachments, and a battery of 18 boilers with 150 pounds steam pressure.

The four band, gang, veneer and re-saws are to be built with a capacity of 400,000 feet of lumber board measure, per day, which will be the largest hardwood mill ever constructed.

The company now own 260,000 acres of the finest virgin forest lan ds in the south, all of which has a perfect title and is suitable for cultivation. The company have distributing yards and branches in Chicago, Cairo, Memphis, Bigbee, and Vicksburg shortly to be added. Their handling of hardwood lumber is enormous, amounting to 100 million feet of assorted hardwood annually, which is distributed to the principal consuming markets throughout the United States and foreign countries.

ABOUT STRAIGHTEDGES.

BY T. L. HILES, IN THE WOOD-WORKER.

How many filers are there who hammer the circular or band saws under their charge, whose attention has never been specially directed to the subject of straightedges ? Not a great many, let us hopè. That there are a few such is evidenced by the occasional accidents which call the subject of straightedges into view. A straightedge is a small affair to look at, but its condition is a large affair in anvil work. How many employers see to it that their filing room is supplied with correctly-made straightedges and with a test bar by which they can be gauged for accuracy ?

Not evèry mill is all that could be wished for in this direction. This is one of those minor things—if there are minor things in a mechanical point of view—which are sometimes left to the chance ability and opportunity of the filer to make for himself from a piece of an old saw. The edges of a straightedge should be parallel right lines. If they are not also straight lines they should vary from straight lines by a certain definite quantity, in a definite direction and for a definite purpose.

To illustrate, Fig. 1 may be a straightedge in which the surface a b c d is perfectly true, a d and b c being straight lines and parallel. It is the practice of some to use a straightedge with the edge concave about 1-100 of an inch, as shown, in an exaggerated form, in m n, Fig. 2. The thickness a b is of importance. The length of the straightedge will govern its general thick-

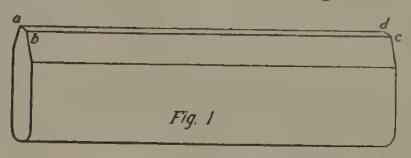


Fig. 1

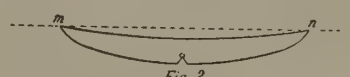

Fig. 2

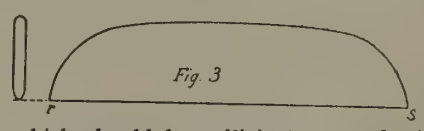

Fig. 3

ness, which should be sufficient to render it stiff so it will not readily spring out of line. The edge a b need not exceed 1-16 of an inch in thickness, and may be less on short lengths. All straightedges should be of good steel, nicely tempered, so they will wear uniformly.

It is surprising to find upon what makeshift tools a mill is sometimes dependent. A young man who is the filer in the mill running a 6-inch resaw, depends upon a tool like that shown in Fig. 3. It is 6 inches long by 2 inches wide, and 13-gauge thick, made from an old circular saw. The edger is round, ground up by hand on a emery wheel. The rounding of the edge varies here and there, more metal being ground off at one place than another. Unless held perfectly vertical it will indicate an apparent lump upon a true surface. The user must often choose between a lump and the appearance of one. The industry he displays with the hammer and the appearance of his saw leads one to conclude he must labor on both the actual and the apparent inequalities.

In another mill a filer, in examining a shingle saw, complained it was in poor shape ; seemed to be crooked and lumpy. An examination of his straightedge showed that it was soft, made from an old band saw, and had some kinks along the edge. Allowing that it was true on the edge, the least inclination of the level from a vertical position showed that what he mistook for lumps and winds in the saw. The worst feature of this case lay in the insistance, by the filer, that the faulty condition of his level had nothing to do with the case. It being a level or straightedgè, and made by himself, satisfied him that anything tested by it and found wanting should be condemned. Reflection, it is hoped, has since cleared away his brash confidence in this particular level. This is a fault in levels to be guarded against. It is just as important that they be true on the sides as on the edges.

A test bar made from a bar of steel 3-16 or quarter of an inch thick by 1 and one-quarter or 1 and one-half inches wide, straightened, and planed and ground true and square on the edge, is very useful for testing the levels in daily use, to correct for wear. If the level is not of a uniform temper it will wear more in one spot than another.

THE
Canada Lumberman

MONTHLY AND WEEKLY EDITIONS

PUBLISHED BY

The C. H. Mortimer Publishing Company of Toronto, Limited

CONFEDERATION LIFE BUILDING, TORONTO

BRANCH OFFICE:
IMPERIAL BUILDING, MONTREAL

The LUMBERMAN Weekly Edition is published every Wednesday, and the Monthly Edition on the 1st day of every month.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in anyway affecting it. Even when we may not be able to agree with the writers, we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

LUMBER PRICES.

FIFTY years ago the timber supply of the North American Continent was much greater in extent than it is to-day. Each succeeding year saw a diminution in the quantity of standing timber, and naturally with this diminution and the fluctuation in the demand came a readjustment of the prices of lumber from time to time. A pamphlet issued by the Treasury Department of the Bureau of Statistics of the United States gives some figures of the average wholesale selling price of lumber for the past sixty years which are exceedingly interesting and suggestive.

The average price of extra clear white pine boards in 1840 was $24 per thousand feet. This price remained unchanged for about 20 years, after which it advanced within four years to $40, and since that time the range has been from $35 to $48. This latter figure was only reached in 1899. Within forty years, therefore, the price of the best quality of pine lumber has advanced 100 per cent.

White pine boards of common quality were selling in 1840 at $10.50 per thousand. From 1864 to 1874 the price ranged from $16 to $22, the latter figure in 1873, and the highest point which has yet been reached for common pine. Since 1874 there has been no sustained advance, the price ranging from $14 to $17, with slight fluctuations from year to year. In 1899 the price was $16, but in the previous five years from $12 to $14. The advance in the price of common boards within the sixty years under review has been only slightly in excess of 50 per cent.

The figures for cull white pine boards cover less than the last 40 years, during which time there has been no substantial advance, the price ranging from $9 to $17, the latter in 1873. The lowest point was reached in 1876, since which time the price has recovered about $4 per thousand.

The price of pine doors, 2 ft. 4 in. x 6 ft. 8 in., 1¼ in. thick, has declined within the sixty years. In 1840 the price per door was $1.75, and in 1899 $1.15. The highest price, $2.25 per door, prevailed in 1874. For the next ten years the price ruled about $2, since which time it gradually declined, until 80 cents was reached in 1896. Thus while lumber prices generally have advanced, doors have been produced at a lower cost. This is doubtless due largely to the introduction of improved machinery and manufacturing methods.

An advance of $3 has been made within the period in the price of hemlock, $9 being the quotation in 1840, and $12 in 1899. The high point of $16 was reached in 1871, and the low point of $8 in 1896.

Very little change has taken place in the price of first quality maple boards, the selling price for the past 40 years being from $20 to $24. Oak boards advanced sharply from 1855 to 1865, selling from $10 to $30 in that period and advancing gradually until 1899, when the highest price of $36 was reached.

The price of shingles has shown a wide variation, the lowest point within sixty years for 16 inch XXX being $1.90 in 1846, and the highest point $5.10 in 1868. From 1864 to 1874 prices ranged from $3.50 to $5.00, gradually declining for the next eight years, then selling at about $3.00 until 1891, when they declined and sold at $2.60 until 1898, when there was an advance to $2.85.

Recapitulating, it will be seen that the best quality of lumber is bringing considerably higher prices to-day than some years ago, while common lumber is but slightly higher. This is the natural result of the decreased production of the higher grades of lumber and the consequent increase in the production of the lower grades. The timber now available produces a smaller quantity of high grade lumber than did the timber of, say, forty years ago. The higher prices now ruling are justified to the fullest extent by the changed conditions. Indeed, it is a matter of surprise that within the period named greater advances have not taken place. The enhanced value of stumpage is alone an item which represents a considerable increase in the cost of producing lumber.

WHAT OF SPRUCE LUMBER?

PERHAPS there is no class of lumber for which the market is more uncertain than spruce. It has been subject to violent fluctuations in price, but has usually recovered the declines in a comparatively short time. The summer of 1899 was one of some depression, while last year spruce prices were higher. So far this season the market has been most uncertain, with the tendency in the direction of lower prices, particularly for British specifications.

Spruce, although quite serviceable, is a lumber which does not occupy an exclusive field. It meets with competition from yellow pine, hemlock, and other cheaper woods which cannot fill the place of white pine. Consequently when the market weakens the effect is immediately discernible in spruce prices.

While as lumber spruce is not particularly favored, it does occupy a unique position as a pulp wood; in fact, it may be said to be the only eminently satisfactory timber for the manufacture of pulp. Large purchases by pulp manufacturers have recently had a marked influence on the price of spruce timber. In the Eastern States, where there are a number of pulp mills, spruce logs have changed hands at $16 per thousand feet board measure.

While at times the spruce lumber market may exhibit signs of weakness, it is well for holders of stock to remember that the spruce lands will each year be drawn upon to an increased extent to furnish the raw material for pulp mills. The curtailment of the production should also be given consideration by lumbermen whenever there are indications of an abnormal supply.

THE RIVERS AND STREAMS ACT.

IN another column is printed a most important judgment affecting the tolls which may be charged by lumbermen for improvements to rivers and streams for the purpose of facilitating the floating of logs. The case was an application under the Rivers and Streams Act to fix the tolls on South Creek, in the District of Haliburton. It is believed to be the first case of the kind in which a decision has been reasoned out by a judge, and the principles on which tolls should be fixed given.

One of the most important claims made by the applicants was that a section of the Timber Slide Companies' Act should be applied when, as in this case, all the improvements were used by the respondent's logs, while the applicants only used for the bulk of their logs two of the lower sections. We are not aware that this point has been brought up before. The decision, it seems, is really in favor of the applicants, as, though treating the improvements as all one construction, the judge has charged the respondents a larger proportion than would have been the case if all had used the improvements equally.

A second claim made by the applicants was that the company building the improvements and running the risk of fire, or destruction of those improvements, were entited to some allowance in that respect by the company who came in after the applicants had run the risk for two seasons. This point the judge did not think was within his province to decide under the wording of the statute. The judgment is an interesting one and will probably form a precedent for lumbermen if it should be upheld on appeal.

EDITORIAL NOTES.

FREIGHT rates represent a very heavy charge against much of the lumber exported from Canada. Last season rates were unusually high, but the indications are that they will be more reasonable this year. The Pacific coast is handicapped by freights on European shipments, while obtaining an advantage over eastern Canada in catering to the markets of Japan, China and Australia. From five to six months is usually occupied by lumber vessels in making the trip from British Columbia to the United Kingdom, three months

to Australia, two months to Japan, and from three to four months to South Africa.

A VERY large attendance of lumbermen and capitalists may be expected at the sale of Quebec timber limits to be held on June 4th, when in the neighborhood of 10,000 square miles will be put under the hammer. It is understood that the Department of Woods and Forests has received many enquiries regarding timber limits and water powers from United States parties, and that fancy prices are looked for.

directions, which relieves the strain caused by the rapid speed of the carriage of the single band. How to take care of the lumber cut on the backward run is a question sometimes asked. Where circumstances will permit it is preferable to have the live rolls placed in the log deck, just below the top of the blocks, carrying the lumber towards the front of the mill clear off the log deck, where it is dropped onto a transfer moving sideways towards the haul-up, then to a chain of live rolls, conveying it under the log deck, back of the band mill, and down to the edger.

quoted by the Americans. We doubt if there is another branch of the wood-working industry on which the margin of profit has been so small, if there has been a margin at all. It is satisfactory to learn that at last steps have been taken by the Wholesale Sash, Door and Blind Manufacturers' Association of the North-Western States to place prices of their products more in accord with the market value of the raw material from which they are manufactured and the capital invested in their establishments. A new list making advances has just been adapted, the first revision since the beginning of 1895.

PUBLICATIONS.

The fifth edition of Baughman's Buyer and Seller, the handy book for lumbermen, has been issued. The lumber tables in this work show nearly four thousand different sizes and lengths, and the number of feet in any number of pieces can be determined at a glance. It contains cost and interest tables, diagrams and rules for cutting rafters, rules for finding number of shingles and number of feet of flooring or siding for any size of building, etc. Copies may be obtained from the publisher, H. R. A. Baughman, Indianapolis, Ind., for one dollar each.

GLASGOW EXHIBITION BUILDINGS—VIEW OF MAIN BUILDING FROM THE NORTH.

THERE are in operation in Canada, to our knowledge, two double cutting band mills. These mills have been in operation for a sufficient time to test their merits as to economy, and general utility, and it is understood they are regarded as a success. No doubt the double cutting band will eventually come into greater use, although its progress may be somewhat slow until lumbermen become more familiar with it. It is learned that within the last three months the first double-cutting band mill has been installed in Washington territory for cutting fir timber, but none have yet been introduced into British Columbia. It is claimed that in addition to an increased output, the carriage travels at a more uniform rate of speed in both

IT has long been the wonder of Britishers how the American door manufacturers, and particularly those of the United States, could sell their product at the low prices which have ruled for some years past. Sentiment on the subject grew so strong that an effort was made about two years ago by the Operative Joiner's Union of Great Britain to boycott American joinery, but this step did not meet with success, an investigation proving that Canadian joinery at least was manufactured under fair and reasonable conditions. Whether the same can be said of the United States joinery may be open to question. It seems strange that with the raw material close at hand our manufacturers have frequently found themselves unable to compete with the prices

A few years ago the logs in a river in a northwestern lumber district had jammed into a nasty snarl, and no one hankered for the job of going out with a canthook and starting the key log. In the crew was an Indian who was noted for his coolness and his keenness. The boss finally looked over in his direction. "Lacoote," he said "you go out and break that jam, and I'll see that you get a nice puff in the paper." The redskin looked at the logs, and then at the boss. "Dead Injun look nice on paper," he grunted, and walked away.

Referring to the British trade, a hardwood manufacturer recently gave it as his opinion that the principal drawback to the export business is that to go into it extensively means the sacrifice to a certain extent of the local manufacturing trade, which particularly should be encouraged. He thought it more satisfactory also to sell to Canadian consumers, as he understood better their requirements. This seems to be the view held by a great many of our hardwood manufacturers. First, they prefer to sell at home from patriotic reasons, to assist in building up the industries of the country; secondly, they find that their trade is more easily handled. To overcome these obstacles, I believe it will be necessary for the British importer to turn his attention, as far as possible, to the handling of hardwoods in the more manufactured state, and also to come up a little in his price. Although the hardwood supply of Canada is in a sense becoming exhausted, there are on cut-over pine limits large quantities of hardwoods to which lumbermen are now giving attention, and as these limits are mostly held by the larger firms, perhaps more stock for export will be taken out in the near future. But I must confess that the average hardwood manufacturer seems content with the local and United States markets.

* * *

A coterie of friends have welcomed back to Toronto, if but temporarily, Mr. John Donogh. Mr. Donogh, as I presume most Lumberman readers know, has of late been engaged in the lumber business at North Tonawanda as one of the principals of the Swan-Donogh Lumber Company. Shortly after establishing himself in Tonawanda Mr. Donogh contracted malaria fever and after a stubborn fight to overcome it, found it necessary to remove from the place and temporarily at least sever his connection entirely from business. Although his health is greatly impaired, Mr. Donogh hopes, by means of a complete relaxation from business and a vacation in Muskoka, to be able to take up the cue again in a short time, although no plans to that end have yet been laid out. Mr. Donogh's company gave considerable attention to the export trade, while he himself has always been a great student of lumber and lumber markets. He believes that eventually a much larger trade will be done direct from the Canadian mills to British dealers and consumers. The number of representatives of large wood consuming concerns who have visited Canada and the United States for the purpose of acquainting themselves with the conditions of the lumber trade was an evidence of this. Many of these came out simply to look over the ground and gave little or no attention to the actual purchase of stock. In his opinion, it is a mistake to ship lumber to foreign countries on consignment, as it frequently results in disaster to the shipper. Reverting to the days of the Donogh & Oliver Co., which handled many millions of pine annually, Mr. Donogh remarked that Toronto was becoming less of a distributing centre. This was also the case to some extent with Buffalo and Tonawanda, and in a very short time they would cease to be distributing points for white pine, as the timber of that variety in the North-western States would soon be cut away. Canada, and the Ottawa district in particular, would then be looked to as a source of supply for the Eastern States. It was fortunate, Mr. Donogh thought, that Canada took steps as early as she did to protect the timber supply. Lumbering in Canada was different than in the United States, inasmuch as our lumbermen seemed to be content to cut a moderate quantity of timber each year with a view to conserving the limits. In the United States this was not the case; such firms as the Weyenhausser Syndicate and Mitchell & McClure, of Duluth, go into the woods and slash everything before them, their sole object seeming to be to get a return of the money invested as quickly as possible. In a few years, he said, they will have to cease business owing to the lack of raw material.

* * *

From a resident of Chelmsford, Ont., who was recently in Toronto, I learn that the Robert Thomson saw mill at that place has been purchased by the Clergues, of Sault Ste. Marie, and that it has been torn down and the machinery taken to the Soo. The Clergues, he said, were purchasing a great many mills in that district. Negotiations were under way between Mr. J. J. C. Thomson and the Morgan Lumber Company for the purchase of the Thomson mill, but terms could not be agreed upon. Had the mill been secured it was the intention of the Morgan Company to raft the logs down the Vermillion river to a point about five miles from Chelmsford, where they would be loaded on cars and carried by the C.P.R. for the balance of the distance. Failing this the logs are being floated to the Georgian Bay. My informant remarked upon the magnificence of the timber in Morgan township, stating that it was the finest in Canada.

QUARTER SAWING.

Probably one of the oldest questions in the wood-working industry is that of quarter sawing logs, and it is one which has never settled down to any set rule or recognized system. The original idea embraced was to cut a log through the center twice, making four quarters, which were presumed to be laid with back down on the carriage and worked into boards. In carrying out this work in detail, however, many ideas and pet theories have been developed, and the lumber trade journals have given from time to time new ideas on the subject, with illustrations of how this man or that did the work. Whether or not all these men carry out the idea illustrated, there may be some question, but the ideas are good things anyway, for they set us to thinking.

THE SIMPLE WAY.

In oak, one of the simplest and probably the most generally adopted methods of quarter sawing is to split the log in half. Then, instead of splitting the half again to make the quarter, it is simply tilted on the carriage as shown in figure 1, and is worked in that position till something near the center line on the face is reached, after which the balance is tilted back to lay in the position shown by figure 2, in which position it is finished up. Some vary this by taking off a light slab at A or B, so that the flitch will rest better on the carriage for working, but the general idea given here is the one which is probably most followed by sawmills in quarter sawing.

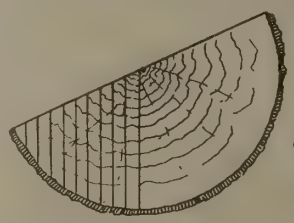

Fig 1

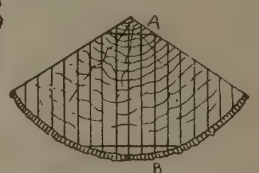

Fig 2.

HOLDING THE LOGS.

The question of how to hold the logs on the carriage has been raised several times, but it is very simple, too, in that it resolves itself into practically only one method. It can be seen, by glancing again at figure 1, that the half log would have a natural tendency to roll back on the blocks and to dog it in the top, as usually practiced in sawmills, will not hold it; consequently resort is had to a duplex dog, one which holds from both top and bottom, so that there is no chance for the log to roll either way. Those who have no equipment for dogging in this way are considerably handicapped when they come to quarter sawing, and they have either to resort to some of the special plans to get the quarter cut, or else turn and slab for a face to rest on the blocks before undertaking to saw up a quarter. In short, it might be said that a man is fooling away his time when he undertakes to do quarter sawing without duplex dogs.

CUTTING SPECIAL STOCK.

It is plain, quarter-sawed lumber of all widths that I have been talking about, and when we turn from that and get into the work of cutting special stock, there are other questions which come up. For instance, if one wants to make quarter-sawn veneer, and do the work on a segment veneer saw, there is required at the hands of the man who prepares the flitches at the mill more than the mere quartering of the log. He must get rid of as much of the slab as possible, so that when the veneer man comes to work up the timber he has practically nothing to do but saw veneer. In making veneer of this kind width is generally quite an object, and it is not unusual to work all the log into something else except that which will produce wide stock, and in doing this it may frequently be better to not quarter the log at all. There are quite a number of ways to do this to get from two to four flitches out of a log which will make reasonably wide stock, and saw so the grain will show quartering, and a study of the log, together with what you can best work the rest of the log into, will soon bring to mind a way to get at the work.

NARROW STOCK.

Where flooring and narrow stock of one kind and another is the product desired, it is frequently produced without any quartering of the log whatever. Some simply saw up their logs and work to get out a fair share of this stock with the edger. Others, especially where they have gangs in the mill for working up the heavy flitches, simply flitch from the side of the log in thicknesses for the width of the boards required, and then turn the flitches down and work them into quarter-sawed stock. Quarter-sawed parquet flooring strips are a sample of this kind of work. Many of these are made even from the slab ends, taken from swell-butt logs, which are cut into planks of such a thickness that when they are made into strips with a gang saw they will dress to 2 in. in width.—Barrel and Box.

PERSONAL.

Mr. Hiram Robinson, president of the Hawkesbury Lumber Co., Hawkesbury, Ont., has just returned from a two months' pleasure trip to Europe.

Mr. Henry Fisher was instantly killed in his saw mill at Amherst, N.S., a few weeks ago. He was sawing hardwood timber, when he was struck over the heart with a slab from the saw.

The death occurred in Winnipeg last week of Mr. John O. Revell, who was for many years prominently connected with the lumbering industry at Coboconk, Ont. Recently he had been employed by Seaman & Company.

Mr. Charles D. Shufeldt, who has been in the employ of Mr. W. F. Bury Austin, wholesale lumber and timber merchant, of Montreal, for the past six years, died in the general hospital in that city on May 29th, of typhoid fever. Interment took place at Albany, N. Y.

The death took place recently of Mr. Charles K. Eddy, of Saginaw, Mich., one of the pioneer lumbermen of Eastern Michigan. Mr. Eddy was eighty years of age, and since 1858 had been engaged in the lumber business, first at Ottawa, Ont. He was the senior member of the firm of C. K. Eddy & Sons, who are owners of large timber limits in the Georgian Bay districts. A few years ago Mr. Eddy retired from active business.

CANADA LUMBERMAN

WEEKLY EDITION

The Lumberman Monthly Edition, 20 pages } $1.00 PER YEAR { The Lumberman Weekly Edition, every Wednesday

THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN, THE UNITED STATES, AND OTHER FOREIGN MARKETS.

VOL. VII. TORONTO, ONT., JUNE 5, 1901 No 19

CANADA LUMBERMAN

PUBLISHED BY

The C. H. Mortimer Publishing Co'y of Toronto, Limited

Confederation Life Building - TORONTO.

Branch Office:
IMPERIAL BUILDING, MONTREAL.

Weekly Lumberman, published every Wednesday. Contains reliable and up-to-date market conditions and tendencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canaian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

Lumberman, Monthly. A 20-page journal, discussing fully and impartially subjects pertinent to the lumber and wood-working industries. Contains interviews with prominent members of the trade, and character sketches and portraits of leading lumbermen Its special articles on technical and mechanical subjects areespecially valuable to saw mill and planing mill men and manufacturers of lumber products.

WANTED AND FOR SALE

FOR SALE.

About 3½ million feet of White Pine, mill run. ½ million feet dry; cut last August. Address,
W. G. DOHERTY, Day Mills, Algoma, Ont.
or
W. DOHERTY & CO., Clinton, Ont.

Wanted at Once.

1,000 pieces 4x8x16
1,700 " 4x10x16

prime quality Douglas Fir, edge grain preferred. Apply Box 44, CANADA LUMBERMAN.

Telephone Poles for Sale.

THE UNDERSIGNED HAVE FOR SALE 5,000 Cedar Telephone Poles, all lengths from 25 to 45 feet. Quotations given by mail or wire on application.
GEORGE & McGREGOR,
Killaloe Station, Ont.

FOR SALE.

120 M feet Sound, Well Cut 1 inch Hemlock, 12, 14, 16 feet;

80 M feet Sound, Well Cut 2 inch Plank, 8, 10, 12 wide, 16 feet;

16 M feet Black Birch, 1 inch, 12 feet.

$8.00 per M for 200 feet hem'ock, dead culls out.
$14.00 per M for birch, dead culls out.

F.O.B. cars, Edgington, Parry Sound Colonization Railway. Address—
S. T. MALKIN,
Terms—2% spot; net 30 days. Edgington.

"SILVER GRAY" SHINGLES.

THE UNDERSIGNED HAVE THE SOLE and exclusive right to the use of the Trade Mark consisting of the words "SILVER GRAY," as applied to shingles and wooden roofing material.

All Persons are Hereby Warned

against using the same; otherwise they will be prosecuted according to law.

THE RATHBUN COMPANY,
Deseronto, Ont.

FOR SALE — 600,000 FEET GOOD WHITE Pine Mill Culls, Dry. Address "OTTAWA," office CANADA LUMBERMAN.

FOR sale—20, 00 FEET DRY ASH, 15,000 feet 1" Elm log run, culls out. Last season's cut. Apply to JOHN DONALDSON, Almonte, Ont.

FOR SALE.

PATCH MACHINE FOR PATCHING BAND Saws; Baldwin & Tuthill make; in first-class condition. Apply Box 28, CANADA LUMBERMAN.

FOR SALE.

Two million 16" White pine Shingles, firsts, seconds and culls. Also Common and Better Birch, 1", 1¼", 1½", 2" and 3". Apply to
A. McPHERSON & CO.
Longford Mills, Ont.

FOR SALE.

A stock of White Pine Lumber, consisting of about 4 million feet, to be manufactured this season at Cache Bay.
Logs could be sawn to order of purchaser. Apply,
THE NIPISSING LUMBER CO., LIMITED
Hamilton.

ASSIGNEE'S SALE.

In the Matter of the Estate of John Howland Owen, Insolvent:

TAKE NOTICE THAT THERE WILL BE offered for sale by Public Auction at the premises known as John Rowland Owen's Mill Yard, Victoria Avenue, Ridgetown, on TUESDAY, 11TH DAY OF JUNE, A. D, 1901, at the hour of two o'clock, p. m., the following Assets of the Estate:

96 M feet Mixed Lumber, 60 M Lath, 77 M Shingles, all of which will be put up in one lot. Also Horses, Trucks, Chains, Harness, Sleighs etc., used in connection with the said business; Also Two Town Lots, being part of the Mill Yard in the said Town of Ridgetown.
Stock list may be seen upon application to the assignee or his solicitor.
Terms of sale and full particulars may be had upon application to them.

HERBERT D. SMITH, Solicitor for Assignee, Ridgetown, Ont.
WM. A. GOSNELL, Assignee, Ridgetown, On.

CURRENT TRADE CONDITIONS.

ONTARIO.

The strength which is shown by the lumber market is very encouraging to holders of stock. Information from manufacturers and dealers in pine is decidedly optimistic, and the outlook for building operations is improving as the season advances. There is a heavy local demand, and a liberal distribution to the Eastern States. The new cut apparently is having no influence upon prices; consequently investors who have delayed carrying out proposed undertakings are now proceeding with the work. The statement of the manager of the Bank of Montreal that the lumber markets were congested and prices ruling low has elicited much unfavorable comment. So far as the markets of Canada and the United States are concerned, his statements are widely at variance with the facts, as it is many years since the market has been in a more healthy condition. With mill culls, for instance, selling at $11 at the mill, surely the market is not depressed. On the other hand, the outlook is that there will be no material decline in the price of pine lumber this year. This might be said of hardwoods also, although this class of lumber is not as active or firm as pine. The British market is doubtless rather heavy, but Canadian manufacturers are not likely to be seriously affected thereby, on account of the increased demand at home and in the United States.

QUEBEC AND NEW BRUNSWICK.

Shipping of lumber during the past week from the eastern provinces has been quite active. Heavy shipments have been made to Great Britain, and vessels have loaded for South America and Antwerp. The shipment to Antwerp is the first that has taken place for several years. The number of vessels under charter seems to indicate that the export of spruce lumber this season will be heavier than was anticipated earlier in the year. The market for square and waney timber is showing strength, pine timber having advanced from one to three cents per cubic foot. Most of the log drives in Quebec are likely to reach the mills, but in New Brunswick several drives have already been hung.

UNITED STATES.

The past week has been one of unusual activity in lumber circles. The buying has been on a comparatively large scale, and sales made in the Lake Superior district have been at the top prices of the year. Although some of the new cut is almost in shipping condition, the sawing season having been in progress for six weeks, white pine lumber is exhibiting increased strength. There seems to be a large present and prospective demand, and a strong belief that there will be no material decline in prices during the summer. From Duluth the sale is reported of several million feet of No. 3 and better at $18, which is a remarkable price. The east is buying quite liberally, and although receipts of lumber at Buffalo and Tonawanda have been quite heavy, the grades are still somewhat broken. In view of the attitude of the western producers the dealers at eastern distributing points may be forced to advance prices. Such a possibility at this season of the year is unusual. The manufacturers of spruce are showing great confidence in the future of prices, the present asking price at Boston being fifty cents above the list. The improvement in hardwoods is slow. Sales of basswood are on the increase, but elm and maple are quiet. Brown and black ash are meeting with better enquiry.

GREAT BRITAIN.

About the only encouraging news from Great Britain is the announcement that at recent sales the buying has shown more animation. Other conditions remain unchanged. The import of timber so far this season has been little less than for the corresponding period of last year, and it is feared that even lower prices may be witnessed before the season closes. A large quantity of the North of Europe production is still unsold. White sea shippers have lately closed some contracts, but the quotations are believed to be fifty shillings lower than the price quoted at the opening of the season. The building trade is inactive, even in the face of the compatatively low price of lumber. While pine deals are reasonably firm, the market for spruce is quite heavy. It is reported that Canadian shippers are accepting lower prices. For instance, 3x9 third spruce has sold at £8 2s 6d c.i.f. London, and 3x7-8ths at £7 5s, the latter being a reduction of 10s per standard on battens. There is a fair demand for 11-inch spruce, but the quantity of this width available is not large.

MANITOBA AND BRITISH COLUMBIA.

There has been a decided improvement in the lumber demand in Winnipeg, and a slightly better trade throughout the province. Building operations are quite active, and higher prices for lumber are looked for in the near future. Conditions in British Columbia are reasonably satisfactory, although foreign shipments have not been heavy. The Provincial Government has prohibited the export of cedar logs, which has affected a number of loggers. A considerable quantity of such logs has been exported to the coast sections of Washington State, where the cedar limits are of little account.

The Whaley Lumber Company, whose mill at Huntsville, Ont., was burned recently, are reported to have sold their stock of logs to a Hamilton firm.

STOCKS AND PRICES.

The steamer Ridal Holme is loading lumber at Chicoutimi, Que., for the United Kingdom, on account of Price Bros. & Co.

The cooperage market is not active, flour barrels beingg especially slow. Michigan staves are quoted in Minneapolis at $8.50.

The steamer Monhegan has sailed from Ship Island for Montreal, with 775,000 feet of pitch pine, consigned to Shearer & Brown.

The steamer Lovstaken is loading a cargo of deals at Riviere du Loup, Que., for the U.K., and the steamer Varax is about to load at Montreal.

The steamer Magda is loading 2,000,000 feet of lumber at Montreal for Antwerp, the shippers being Watson & Todd. This is the first shipment of lumber made from Montreal to Antwerp for many years past.

Eastern spruce is held in New York at $18 to $20. In Portland, Maine, prices are $21 for 12-inch, $15.50 for 1x3 to 1x11, and $16 for scantling. Spruce clapboards are quoted at $32 for extras, $30 for clears, and $26 for second clears. Dry spruce covering boards bring $15.50 to $16.

The steamer Georgia sailed last week from Digby, N.S., for Cienfuegos, with lumber. The barque Lillian is loading lumber at Tusket Bridge, N.S., for Buenos Ayres. The brig. James Daly, is loading at Liverpool, N.S., for the Barbadoes, and the sch. Frances A. Rice will load again at Weymouth, N.S., for the West Indies.

The steamers Daventry and Gladstrey are loading lumber cargoes at Sillery Cove, Que., for the United Kingdom. The steamer Dunmoore Head is loading a cargo of deals at Batiscan, Que., for Cork, Ireland. The Loughrigg Holme is about to load a cargo of lumber at Montreal for Barrow, Eng., the shippers being Watson & Todd.

C. H. McMichael, of Beaverstone, Ont., states that they expect to have their drive of logs out in about two weeks. On one of the creeks the water is low, and about 25,000 pieces are in danger of being hung up.

A shipment of square timber, comprising four cribs of 135 pieces, was made from Lindsay last week for England. It was cut in Cartwright township, and consisted chiefly of elm and birch.

The shingle market at Saginaw, Mich., is active, stocks being taken about as fast as they come from the saw. There is as yet very little stock accumulating, and as the product is not so large in eastern Michigan as years ago, it is not expected that there will be any shingles piled up for any length of time. The market is firm, with quotations there at $2.50 and $3.50 for 18-inch white pine; $1.75 to $3 for 16-inch white pine; cedar shingles, $2 and $3, for 18-inch and $1.50 for 16-inch cedar.

A correspondent thus refers to the Michigan lumber market: The market never manifested healthier conditions. There is a demand for all kinds of stock. Good lumber is particularly firm. Michigan white pine is worth from $17 to $25, and Canada stock from $16 to $21 for log run. Box lumber has not been so strong as some other grades, but is quoted at $12.50 to $15. Norway is in demand, but only two or three firms are cutting it, and the old stock is practically exhausted. It is worth $11 and up, according to dimension. Mill culls are worth $12 to $13.

At an auction sale at Dublin, Irelabd, on May 25th, held by Richard Martin & Co., Canadian timber brought the following prices per Irish standard: 3rd Quebec spruce, 11ft. 9x3, £12; 12ft. 9x3, £13 5s.; 11ft. to 13ft. 7x3, £12 2s 6d. to £12 7s. 6d. to £12 7s. 6d.; 13ft., £12 10s; 7s. 6d.; 13ft., £12 10s.; 16ft John spruce, 14ft. to 18ft. 11x3, 7s. 6d.; 19ft. 11x3, £13 10s.; 14ft 9x3, £13 10s.; 15ft. to 18ft. 9x3, £13 10s.; 19ft., £13 17s. 6d.; 20ft. and 21ft. 9x3, £14 7s. 6d. 2nd Quebec spruce, 11ft. 9x3, £12 15s.; 12ft. 9x3, £13 12s. 6d. to £13 15s.; 12ft. 11x3 £12 12s. 6d. to £13 17s. 6d. Bay Verte spruce, (10 5s. to £10 17s. 6d.

THE BOSTON MARKET.

There continues to be a very firm market for spruce lumber, with the demand active and the supply not fully up to requirements. It is claimed the scarcity of logs on the St. John will be even more serious than at first reported. Not much cargo spruce is coming forward, and the car mills are delaying orders.

The quotations on spruce in this market are firmly held: Ten and 12-inch dimensions, $18@19.50; 9-inch and under, $17@$18; 10 and 12 inch random lengths, 10 feet and up, $17.50@18.50; 2x4, 2x5, 2x6, 2x7 and 3x4, 10 feet and up, $15@16; all other randoms, 9-inch and under, 10 feet and up, $15.50@17; 5-inch and up, merchantable boards, $15@$16; matched boards, $17 to $18; out spruce boards $12.50; bundle furring, $14.

There is a firm market for hemlock lumber, with the supply small: Pennsylvania, No. 1, $16 to $17; No. 2, $14 to $15; eastern Pennsylvania boards, $15 to $16; random, $13 to $14.

Western white pine is steady and unchanged: Uppers, 1 inch, $58 to $62; 1¼ to 2 inch; $63 to $64; 3 and 4 inch $68 to $72; selects, 1 to 4 inch, $52 to $64: fine common, 1 to 3 inch, $45 to $60; sheathings, $38 to $54; barn boards, $25 to $30; coffin boards, $23 to $25.

There is a quiet demand for finishing hardwoods, but whitewood is firm, owing to the scarcity in the South: One inch, whitewood, $37 to $39; thicker, $39 to $42; ⅝ inch, $30 to $33; saps, inch, $25 to $30; common, $23 to $25; quartered oak, $65 to $75; fancy, $85 to $90; plain oak, $35 to $45; ash, $38 to $45; cherry, $90 to $130; maple, $30 to $40; sycamore, quartered inch, $40 to $50; walnut, $100 to $130.

There is a steady market for shingles, with prices firm: Extra cedar, $2.85 to $2.95; clear, $2.60 to $2.65; second clear, $2.15 to $2.25; clear white, $2; extra No. 1, $1.90; Washington and British Columbia, 16-inch, five butts to 2 inches, $3.15 to $3.25.

Clapboards are firm and unchanged: Extra spruce, $30 to $31; clear, $28 to $29; second clear, $25 to $26; pine extra, $36 to $38; clear, $36 to $37; second clear, $28 to $30.

Laths are easier with a fair demand. The quotations here are: 1¾ inch, $2.85 to $2.90; 1 1/2 inch, $2.70, to $2.85.

Boston, Mass., June 3rd, 1901.

INQUIRIES FOR WOOD PRODUCTS

Enquiry has been made from the Canada Lumberman for names of Canadian shippers of pine, spruce and hardwoods who wish to secure a responsible firm of London brokers to handle their shipments and advise them regarding the market. The name and address will be furnished upon request.

QUEBEC TIMBER LIMIT SALE.

The sale of timber limits advertised by the Quebec Government took place in the Parliament Buildings, Quebec, on June 5th. There was an unusually large attendance of lumbermen and others interested. Mr. Blouin, of the Crown Lands Department, acted as auctioneer. Although the bidding was not particularly spirited, the result was satisfactory. In all about 2,700 square miles were disposed of, at an aggregate price of $402,300. At 4 o'clock the sale was adjourned until the 26th inst., when the unsold limits in Saguenay district will be put up. The largest purchases, with quantity and price, were as follows:

	Sq. Miles.	Price.
W. H. Davis	2,297¾	$193,790
St. Maurice L. Co.	544	51,721
Hon. R. Turner	226	29,306
B. A. Scott	136½	22,265
W. Power	193½	21,201
Art Du Tremblay	149	18,625
J. S. Dansereau	132½	15,517
Charlemagne and Lac Ouareau L. Co.	280	10,949
Jas. Clarke	176	16,717
Dr. Warren	110	7,051
Donat Denereau	80	6,334
Saguenay L. Co.	66	6,144
Price Bros. & Co.	128	4,929
Drouin & Frere	23¼	2,399
Geo. H. Eaton	33	2,312
New Richmond L. Co.	32½	1,437
Kilgour Shives	17½	1,124
R. McConnell	15	811
H. Atkinson	8	432
Mr. Pettit, M.P.P.	4½	357

Do not neglect to read the advertisements in each issue of the Weekly Lumberman. They contain much of interest.

THE NEWS

—Simon LeBlanc intends building a steam saw mill at Balmoral, Ont.

—It is said that there are 5,000 acres of timber land in Kings county, P. E. I.

—Shultz Bros., of Brantford, Ont., will probably add a box making plant to their works.

—Alex. McCauley, of Edmonton, N. W. T., will this season operate a saw and shingle mill near Hastings Lake.

—Larry Guthro was burned to death in the saw dust furnace of J. B. Snowball's saw mill at Chatham, N. B.

—The cullers' examinations for the province of Quebec will be held in the Crown timber office, Hull, on June 17th.

—S. P. Hovey has purchased a saw mill at East Hereford, Que., and will put in machinery for barking pulp wood.

—The site is being cleared at Revelstoke, B. C., for the large saw mill to be built on the Big Eddy site by Mr. Robinson.

—The Lakeside Wood Company, of Cookshire, Que., is applying for incorporation, to carry on a general lumbering business.

—Muirhead & Mann, sash and door manufacturers, Victoria, B. C., have dissolved partnership, James Muirhead continuing.

—It is the intention of J. & C. Hickman, of Port Elgin, N. B., to put in a Dutch furnace to burn the sawdust and refuse of their mill.

—A new planing mill at Port Arthur, Ont., is being built by Purcell & Kelly, who have purchased a stock of lumber from Seaman & Company.

—Jacque Snider, son of Henry Snider, of South Cayuga, was killed in his father's saw mill by being caught in the belt and drawn into the machinery.

—The South River Lumber Company have made considerable improvements to their mill at South River, Ont., by which the capacity has been greatly increased.

—Several large saw mills have been built this spring in the eastern section of Halifax county, N. S. F. Crook, of Mineville, is operating a mill at West Laurencetown.

—By the explosion of a boiler in a saw mill in the township of Burpee, owned by Miller & McMillan, of Gore Bay, Ont., three men were killed and the mill totally wrecked.

—The Southampton Manufacturing Company, of Southampton, Ont., have moved the machinery of their saw mill at Pine Tree Harbor to Southampton, where a new mill has been built.

—S. B. Trick, of Courtice, Ont., has purchased Stevens & Argue's saw mill at Norland, Ont., and intends putting in machinery for the manufacture of staves, hoops and headings.

—The saw mill originally owned by Thomas Sadler, of Lindsay, situated at Biscotasing, Ont., has been purchased by Booth & Shannon, of Pembroke, who commenced operations last month.

—W. N. Drader, of Chatham, Ont., has announced his intention of putting in additional machinery for the manufacture of staves and hoops. He expects to mauufacture 4,000,000 feet of lumber this year.

—The Smokey Falls Mfg. Company, of Sturgeon Falls, Ont., has been incorporated, to manufacture lumber and other wood products. H. E. McKee, J. W. S. Corley, and J. T. Loftus comprise the company.

—C. F. Braman and W. H. McCormick, of Bay City, Mich., have purchased the saw mill of the Spanish River Lumber Company at Spanish River on the Georgian Bay. The deal also includes a general store and all the appurtenances of the plaht. The mill has an annual capacity of 20,000,000 feet, and is equipped with band saws, gang and circular rig.

—The lumber surveyors of St. John, N. B., who went on strike recently, are reported to have returned to work at the former rates. It is said that the rules of the Lumber Surveyors' Association have been suspended.

—A large dry kiln in connection with the works of William Cane & Sons at Newmarket, Ont., was burned recently, the fire originating from an overheated box on a small shaft which ran the elevator, carrying the staves into the kiln.

—The Whaley Lumber Company have suffered a serious loss in the destruction of their saw mill at Huntsville, Ont. Although the insurance did not nearly cover the loss, it is understood that the work of reconstruction is shortly to be commenced.

—The Victoria Planing Mills at Lindsay, Ont., owned by J. P. Ryley, has been purchased by George J. Brumwell, late of Bridgenorth. Mr. Brumwell is an experienced lumberman, having been associated with his father in operating a saw mill at Bridgenorth.

—J. R. Booth has announced his intention of moving his saw mill from Ottawa to some point furthur down the river, and as soon as a site is selected construction work will be begun. The machinery in the Chaudiere mill will be transferred to the new one.

—Webb Isenor is building a new saw mill on McDonald's lake, near Halifax, N. S. Three or four attempts at building a mill at this place have been made. Once the dam broke and the mill was washed away, while on another occasion the mill was burned just after being completed.

—The Dickson Lumber Company, of Peterborough, Ont., have appealed against a decision of the Master-in-Chambers to increase the security for costs in their case against the Standard Agency Company, of Montreal, for $20,000 damages for non-delivery of lumber. This case was begun some nine years ago.

—The Cleveland-Sarnia Saw Mill Company, now applying for a Dominion charter, are building a new mill at Sarnia, Ont. It will be 50x160 feet, equipped with modern machinery throughout, consisting of two band mills, band resaw, two edgers, slab slasher, trimmer, lath mills, log loaders, steam kickers, and necessary live rolls. It will be located north of the mill of Mr. L. Dean Holden, the president of the company, which is 40x100 feet, and now in operation. Between the two mills a boiler house 48x136 feet is under construction. This will contain a battery of six boilers, 72 inches x 16 feet, also the dynamo room, machine shop and two engine rooms. In the engine room on the north end there will be installed a Corliss engine, 24x42 feet, to drive the new mill; the south engine room will be provided with an engine later, it being the intention of the company to remodel the present mill, making it a special bill timber mill to run the year round.

QUESTIONS AND ANSWERS.

"W. W.," Newark, N.J., asks for the addresses of some manufacturers of spinning rollers.

Ans.—Rollers and turned wooden goods generally are manufactured by the Lachute Shuttle Co., Lachute Mills, Que.; Canadian Wood Specialty Co., Orillia, Ont.; Ker & Harcourt, Parry Sound, Ont.; Colin Reid, Bothwell, Ont., and others.

Gibson & Co., of Wroxeter, Ont., write: Does any demand exist in Ontario for short length maple flooring (16 inches and multiples), end matched and nailed and bored.

Ans.—We do not think there is a demand in Ontario for maple flooring in the sizes referred to. In the United States flooring as short as 16 inches is used, but in this country the architects almost invariably specify lengths 8 feet and upwards.

We have a point in dispute between two lumber dealers, and would like your authority as to the custom of the trade and your opinion. A sells B half a car of mill run 4 inches and up. When car arrives, B says it is not mill run, as he says lumber from 6 to 9 ft. long is mill run shorts. A says B asked him the length, and he told B that he did not know, but B gave A the order just the same, and now B refuses the car on the length, as B claims it is not mill run as known by the trade. Kindly give your opinion. Was A right in selling 6 to 9 ft. lumber 4 inches and up for mill run, or was A misrepresenting the lumber? If so he wishes to be put right.

A SUBSCRIBER FOR YEARS.

Ans: The custom of the trade is to regard mill run lumber below 9 feet in length as mill run shorts, hence we think that the lumber was misrepresented by the seller.

LEGAL.

Godwin v. Newcombe.—Judgment by Court of Appeal, Toronto, on appeal by defendants from judgment of MacMahon, J., entered upon verdict of a jury. The action is for damages sustained by plaintiff while employed by defendants as a machinist to work a jointer machine in their piano factory, in the city of Toronto. On the occasion of the accident, the plaintiff had joined and left a piece of wood in its usual place, when it fell and forced his left hand upon the knives of the machine which, owing, he says, to the defendants' negligence, were unguarded and unprotected. Plaintiff alleges defendants were also negligent in not providing a truck whereon to place material after it had been jointed. The jury, by their answers to the questions submitted to them, found that the machine was in a defective condition, because unguarded, owing to negligence of defendants' foreman, to whom defect was known, and the cause of the accident was the piece of wood falling upon plaintiff's hand and forcing it against the knife, and that he could not have avoided it by the exercise of reasonable care. Appellants contended that the answers of the jury, read with the evidence, did not amount to a finding of negligence against defendants; that the plaintiff was negligent in placing the jointed board where he did, and its fall was the approximate cause of the accident; the machine had been sufficiently guarded within the Factories' Act, by what is known as the fence guard; that on the evidence the foreman was not negligent. Held, that the jointer was machinery within the meaning of the Ontario Factories' Act; held, also, that no objection having been taken to the submission of the questions, nor any additional question suggested, it is now too late to object; Star Kidney Pad Co. v. Greenwood, 5 O. R., 28; Sexton v. Borewand (1900), A. C. 155; that the questions to and answers of the jdry constitute a finding that the absence of a guard was a defect in the condition of the jointer, and was known to defendants' foreman, who was entrusted with the charge of it, and that though no direct question was put as to the absence of the guard being the cause of the injury, the evidence amply justifies the inference that such absence was the cause. "The governing principle is that when a machine is defective with reference to danger, and such defect is within the knowledge of the employer, he is then liable;" Tate v. Latham (1897), 1 Q.B., 502; Morgan v. Hutchison, 59, L.J.N.S., 197, and distinguishing Walsh v. Whiteley, 21, Q.B.D., 371. What plaintiff did in placing the wood in the position from which it fell upon his hand had not the effect of severing the casual connection between the defendants' negligence and the accident, for their negligence was still continuing and was the primary cause af the accident; Thomas v. Quartermaine, 18, Q.B.D., 685. Appeal dismissed with costs.

Attention is called to the new advertisement of Thomas Pink, of Pembroke, appearing on the back corner of this issue. Mr. Pink manufactures the well known and famous Pink lumbering tools, and also makes a specialty of cant hook and peavy handles, using specially selected split rock maple. He can, as in the past, supply the trade by car-load or dozen.

WOOD PULP DEPARTMENT

CHEMICAL WOOD PULP.*

By J. A. McCew.

The word pulp is a term which generally may be applied to a number of materials, which are quite variable in character but more or less similar in appearance, therefore if we first classify these in a general way, we shall have a somewhat clearer conception of that special kind that we are about to discuss. We may divide them into four classes according to quality, namely :

I. Rag Pulp—which is made from cotton, linen or hemp fibres.

II. and III. Wood Pulps—which are of two kinds, chemical and mechanical.

IV. Straw Pulp—which is a chemical product of inferior quality.

As the manufacture of mechanical wood pulp was very ably described in a paper read before this Society last year, the subject matter of this article will deal exclusively with its half-brother of the chemical species, which is in reality another product from the same substance.

Mechanical pulp is simply wood ground to a fine powder and consists chemically of a combination of celluloses and lignocelluloses. Now if instead of grinding, we treat the wood with a chemical solution, which disintegrates it and dissolves out the lignocelluloses, we than have left what is commonly called chemical pulp, and this consists of those celluloses which have resisted the action of the solvent. As about half of the woody substance is thus removed and destroyed, the remaining product must necessarily be more costly than the ground pulp, but the fibres remaining are white and unbroken and are only comparable with thè cheaper product when quality is not required. Mechanical pulp has a very short fibre, little felting power, is quickly discolored in air and light, and is only used as a filling material in news, wrapping, and other papers of a temporary character. Chemical wood pulp, however, makes a good, white, permanent pulp, and is the source of most of our writing materials, although it makes neither as strong nor as resistant a paper as do the rag pulps.

The pulps prepared from straw are pronounced oxycelluloses, and have considerably more chemical activity than those prepared from the woods.

There are two distinct methods of preparing the chemical wood pulp, which may be designated as the alkaline and the acid. In the alkaline or soda process the usual method employed is to pack the wood in the form of chips into a horizontal cylindrical rotating digester, which has a capacity of about three cords. Here it is digested, with about seven hundred gallons of a six to nine per cènt. solution of sodium hydrate, which is heated to high temperatures by means of live steam. The boiling lasts from eight to ten hours, at pressures which may vary from sixty to two hundred and ten pounds per sq. in. The products resulting from this "cook" are grayish brown pulp and a dark brown liquor, which are dumped into iron washing tanks, and after the liquor is drained off, the pulp is thoroughly washed. But as these wash waters are finally evaporated in order to recover the contained soda, they are used until they become quite concentrated, the pulp being washed continuously with a less concentrated solution until all the alkali is removed. The pulp is now treated with a bleaching solution, which contains twelve to fourteen pounds of bleaching powder for every hundred pounds of pulp, and this removes the remaining ligneous matter, leaving a pure white cellulose.

The recovery of the soda from the waste liquor is accomplished by evaporation in vacuum pans until it has a density of 40 degrees Baume, when it is burned in a special furnace to remove the organic matter. The remaining ash contains the soda in the form of a carbonate, and when this is heated in tanks with slaked lime, in the proportion of one hundred of soda to sixty of lime, the lime is precipitated as calcium carbonate and the soda becomes caustic again.

Another method of recovering the soda, which has been lately adopted, consists in heating three parts of ferric oxide with one of soda carbonate, when sodium ferrate is formed. And on heating this with hot water, it decomposes, forming sodium hydrate and ferric oxide once more. The liquors of the alkaline process, sometimes contain large quantities of the sulphate or carbonate which are cheaper although weaker in action than the hydrate. In addition to the recovery of the soda from these liquors, a valuable product in the form of acetate, may be obtained from the organic matter of the solution. As perhaps you are aware, one of the standard methods for the manufacture of oxalic acid, is the treatment of wood or sawdust with alkalinè hydrates at temperatures ranging from 200 degrees to 250 degrees C.

Now if the heating is prolonged and oxidation is allowed to take place, either from contact with air or oxidizing agents, a large percentage of acetic acid is formed. Therefore if the soda liquor is evaporated and charred at temperatures from 350 degrees to 400 degrees C, the organic matter reacts with the soda to form sodium acetate ($Na\ C_2\ H_4\ O_2, 3H_2\ O.$). This product comprises about 38 per cent. of the soluble portion of the char, and about 16 per cent. of the residue. With Esparto liquor five to six per cent. of the weight of the original fibre was obtained.

In the soda process poplar is largely used, although maple, cottonwood, white birch and basswood, are also employed. The spruce, pine and hemlock yield a long fibre, but are a little more difficult to trèat. The main objections to the process are :

1. The high temperatures and pressures required.

2. The formation of dark colored products which are difficult to remove from the pulp.

3. The destructive action that the alkalis have on the celluloses themselves, as the less resistant are attacked and dissolved in the severe treatment required to remove the ligneous portion.

The acid or sulphite procèss :—

This is the process which is now being most commonly introduced into this country, because it has several important advantages over the alkaline treatments just described. In the first place, the cost in chemicals is less ; and a larger yield of fibre is obtained, which is not weakened by the treatment. And secondly, the paper, which is made from this pulp is harder and more transparent and durable than that from wood pulps made by other methods. The treatment consists in digesting ehe wood at high temperatures with an acid sulphite solution. The acid radical unites with the products of hydrolysis to form soluble sulphonated derivatives, while the base unites with the acid products of the decomposition. The hydrolitic action is greatly increased by the presence af sulphurous acid, and for this reason, the bi-sulphite ($Na\ H\ SO_3$) solution effects a reduction in lèss time, and at lower temperatures, than a neutral sulphite solution would.

Now, turning our attention to some of the details of the treatment, we find that the bark and knots and also the resinous matters of the wood, are very slighly acted upon by these sulphite solutions, and must in consequence be carefully removed. Sound knots may be allowed to pass through the digester and be afterwards removed from the pulp by screens. Before very high temperatures are reached it is necessary that the wood be thoroughly impregnated by the solution, and the absorption is hastened by previously crushing the wood. Dry and green woods, or woods of different species, should not be treated together in the same digester as they will be unequally reduced and leave chips in the pulp.

The first step in the preparation of the sulphite liquor is the formation of sulphur dioxide (SO_2) from the combustion of either sulphur or its compounds. As this gas must be absorbed by water to form sulphurous acid ($H_2\ SO_3$), it is evident that the less it is diluted with other gases the more complete will be its absorption. Therefore, the sulphur is burned in specially constructed furnaces with the object of obtaining a complete combustion with the smallest possible draught. If the combustion of the sulphur is incomplete, a part of it sublimes and re-acts with the sulphur dioxide to form thiosulphuric acid ($H_2\ S_2\ O_3$) which in turn forms thiosulphates. These will decompose on boiling, and precipitate the sulphur into the pulp, which, being practically insoluble, it is impossible to remove. When this sulphur becomes oxidized to sulphuric acid it is very injurious to the paper making machinèry as well as the pulp.

When pyrites is used in the production of sulphur dioxide more complicated burners are used, and additional care taken to avoid overheating for slags are easily formed which impede the draught and are difficult to remove. Blowers or exhaust fans are used to improve the draught through the furnace, and these cause a lot of fine dust to be carried over with the burned gases. This dust never reaches the pulp, however, as the gases pass directly from the furnace into a dust chamber where it settles before the gases enter the cooler.

From the fact that one volume of water at zero centigrade will absorb sixty-nine volumes of sulphur inoxide, and at forty degrees will absorb but seventeen volumes, it is evident that the temperature of both gases and liquor will be kept down as much as possible during absorption. In practice the temperature of the cooler varies from ten to fifteen degrees. The absorption apparatus are of two kinds, namely, that in which the gas is absorbed by water holding the base in suspension or solution ; and that in which the gas and water react together upon lumps of the carbonate of the base. The latter method, which is the oldèr and simpler, consists of a high shaft or tower packed with limestone or dolomite, which is covered by a thin film of water that enters from above. The gases enter the base of the tower under pressure sufficient to force them through the limestone and out at the top. The sulphur dioxide meeting the moist limestone, reacts with it, forming at first sulphurous acid ($H_2\ SO_3$), and then calcium sulphite ($Ca\ SO_3$), while this insoluble product unites with more sulphur dioxide to form calcium bi-sulphite ($Ca\ H_2\ (SO_3)_2$), which being soluble is washed out by the descending water. The former or tank apparatus is the one generally used in this country, and consists of a series of tanks filled with water which holds the carbonate in solution or suspension.

In this case the chemical reaction is practically the same as just described, for as the sulphur dioxide is absorbed, the insoluble calcium sulphite is precipitated, but becomes redissolved as it reacts with more sulphur dioxide to form the bi-sulphite ($Ca\ H_2\ (SO_3)_2$). In practice more or less of the insoluble sulphate ($Ca\ SO_4$) is formed by oxidization, which is allowed to settle and then

*Abstract of a paper read before the Engineering Society of the School of Practical Science, Toronto. Published by permission.

the liquor is drawn off and stored in air tight lead lined tanks, until it is required for use.

The real process of pulp making begins when the chips and liquor are brought together in the digesters, which vary in size, and may be either upright or rotary. But the great difficulty in making digesters for this process, is to obtain a suitable lining which will protect the iron plate from the corrosive action of the sulphurous acid. The usage in the past has been generally in favor of lead linings, as they are but slightly acted upon by the acid, and are further protected by the coating of lead sulphate which forms. The objection to the use of lead, to overcome which many devices have been tried, is the fact that it has about double the co-efficient of expansion of iron, so that in alternate heating and cooling, it buckles and draws to such an extent as to soon necessitate repairs.

Bronze linings have been used with some success, and boiler scales in the form of sulphite of lime or silicates of iron and calcium have worked very well.

But the digester lining that takes the precedence and which is now being rapidly introduced is merely a layer of Portland cement about four inches in thickness, and this may be applied to the boiler directly or first made into slabs and then fitted in. At first it is more or less porous, but the interstices are soon filled by a deposit of sulphate and sulphite of lime which renders it quite impervious. The cheapness of the application and repair of this lining will recommend its general adoption.

In a digester containing two cords of chips, about twenty-five hundred gallons of a three and one-half per cent. liquor is used. The temperature is raised slowly until after the wood has become saturated with the liquor, and then a steam pressure of sixty-five to eighty-five pounds is turned on, which is equivalent to a temperature of one hundred and fifty-five to one hundred and sixty-five degrees centigrade. At these high temperatures the bi-sulphite is decomposed into sulphurous acid, and the normal sulphite, which being insoluble, is deposited in the pipes or pulp. The sulphurous acid gas forms a hydrostatic pressure, which, added to that of the steam for the given temperature, gives the total pressure in the boiler.

Thus the pressure may be considerably increased, by the formation of this gas, without an equivalent rise in temperature. On account of the greater convenience the digesters are heated by means of live steam, which, by condensing in the pulp, is continually diluting the solution, but by employing a non-conducting jacket very little difficulty is experienced in practice, especially when cement linings are used.

At the end of the cook the gas is nearly all blown off and then the pulp is blown out under a pressure of about thirty pounds. This saves time in handling and the trouble of beating. It must now be thoroughly washed to remove any of the precipitated sulphite, especially when bleaching is to follow, for the sulphite is a strong anticolor itself, as it takes up the free oxygen formed by the action of the chlorine.

The pulp is never a pure, permanent white until after the ligneous and coloring matters remaining, have been broken up and removed by the action of a bleaching agent. The true bleaching action is purely an oxidization, which breaks up the coloring matters into simple colorless oxidized derivatives. With bleaching powder ($Ca\ O\ Cl_2$) the chlorine unites with the hydrogen of the water and this action liberates the oxygen which does the work. Pure oxygen, ozone or hydrogen peroxide, may also be used with equal effect. On the other hand the bleaching action of sulphurous acid is of a quite different character, for it combines with the coloring matters to form colorless compounds, which are easily reduced with a return of the color when the acid is neutralized.

You will naturally wonder what becomes of the waste liquor in this process, and this is one of the problems that has been left for this country to decide. In some places the gas is recovered but the general practice is to dump the liquors into the nearest pond or stream to get rid of them. This not only means a loss of half the woody structure and the gas in solution, but the effect of these liquors in fishing streams is remarkable. The sulphurous acid being a reducing agent, combines with the free oxygen in the water, and the organic paste in the solution forms a coating over the gills of the fish; therefore the fish have left no atmosphere and could not breath it if they had. If the waste liquor is evaporated, the residue has no fuel value, therefore we must look in other directions for methods of conversion into valuable bi-products. All that is known concerning the chemical composition of these liquors, is that they are sulphonates containing the OCH_3 group. Future research may result in the manufacture of either glucose, alcohol, oxalic or acetic acid, from this organic residue.

Resinous woods are not very suitable for pulp making, as the resins are insoluble in hot bi-sulphite solutions, and although they are dissolved by the alkaline solvents, every hundred parts of resin will neutralize eighteen parts of the alkali.

Woods such as chestnut, which contain tannin, should not be treated by the sulphite process, as the tannic acid would act as an oxidizing agent, converting the sulphurous into sulphuric acid. Spruce and poplar are used almost exclusively in the sulphite process.

TO ASSIST PULP MAKING.

An act was passed by the British Columbia Legislature, at its recent session, to assist the development of the pulp industry in that province. The bill reads as follows:

Whereas it is expedient to encourage the manufacture of wood pulp and paper; therefore, His Majesty, by and with the advice and consent of the Legislative Assembly of the Province of British Columbia, enacts as follows:

This act may be cited as the "Wood Pulp Act, 1901." It shall be lawful for the Chief Commissioner of Lands and Works to enter into an agreement or agreements with any company holding any water records or water privileges under the "Water Clauses Consolidation Act, 1897," and amending acts, by which on the erection and completion by the company of a pulp or paper mill of such capacity as shall be provided for in such agreement, all said water records or water privileges held by the company shall be reserved to the company without liability to forfeiture, except for non-payment of fees, for a period not exceeding twenty-one years from the date of such agreement, and providing for the payment of fees to the government of British Columbia for the said period of twenty-one years in accordance with the schedule of fees which shall be in force at the date of the said agreement. After the said period of twenty-one years, the scale of fees shall be fixed under such conditions and regulations as may be deemed advisable and determined by the Lieutenant-Governor-in-Council. The said agreement may contain such terms and conditions as the Lieutenant-Governor-in-Council may deem advisable.

PULP NOTES.

—It is said that J. B. Klock of Klock's Mills, Ont., is talking of erecting large pulp and saw mills at Les Erables, near Mattawa, Ont.

—The dispute over the location of the pulp mill of the Blanche River Pulp & Paper Company has been settled, and it is expected that the mill will be built at Mattawa, where there is reported to be ample water power.

—A meeting of the creditors of the Consolidated Pulp & Paper Company, of Toronto, has been called. The company was organized last year, with a capital of $500,000, and recently took over the paper mills of Thompson Bros. at Newburg, Ont.

—William Kennedy, jr., of Montreal, consulting engineer for the Hull & Ottawa Power, Pulp & Paper Company, is preparing plans for the improvement of the water power and for the power house and pulp and paper mills. The company have recently acquired the rights of the portion of the Table rock water power formerly owned by Alex. Fraser.

—The Inglewood Pulp & Paper Company held a meeting in St. John, N.B., recently at which it was decided that the saw mill at Musquash should be continued to be operated this season, and that in the fall steps would be taken to erect pulp and paper mills. The directors elected include Duncan Stetson, George McAvity and G. Mullins, of Bangor, Me., B. F. Pearson, of Halifax, and Chas. Burill, of Weymouth, N.S.

—A syndicate has been formed to build a pulp mill at Petawawa, on the Ottawa river, ten miles above Pembroke, Ont. Messrs. J. W. Munro, M. P.P., of Pembroke, and A. T. Mohr and J. C. Scovel, of Buffalo, are the promoters. The extent of pulp limits to be set apart has not been decided by the Government, but the syndicate has been granted the necessary water power. The agreement calls for the erection of a mill of a daily capacity of 50 tons.

BRAZING SAWS.

The parts to be joined should be beveled to a feather edge, the level being about 5-8th inches long, the ends perfectly square, and the taper uniform. Too much attention cannot be given to this latter point. If the bevel is not uniform and surface of same perfectly even, a good joint cannot be made. Clean the beveled parts with brazing solution or slacked lime, until entirely free from grease or dirt of any kind. Place the ends to be united in the brazing frame with the beveled edges lapped directly at the center where the brazing irons are applied. Clamp same so that the back of the blade is straight. Clean a strip of silver solder in the same manner as the bevel surfaces, and place between same. Then apply the brazing pads, same having first been heated to a bright cherry red and scraped clean and free from all scales. Clamp same upon either side of the blade where it is to be joined, and then immediately loosen the side clamps to allow for the expansion of the blade and to relieve the joint of any strain. As the brazing pads cool, the clamps that secure same upon the joint should be tightened. Allow the pads to remain until they become black. Do not attempt to cool with water. The braze should then be dressed, leveled and tensioned. After using a few times, the pads should be again dressed to a true surface. Be sure that they have a true surface.—From J.A. Fay & Egan Company's Brochure.

PRINCIPAL CAUSES OF SAW BLADES CRACKING.

Insufficient hook to the teeth is one of the causes.

Crystalizing the saw by running it against the back guard. Should the blade through any accident or inattention, come in contact with the back guard, hold a piece of soft emery stone against the back edge of the blade while it is moving slowly.

Sharp corners in the throat or gullet.

Uneven tension ("tight and loose" places.)

Feeding too fast as the log comes in contact with the blade.

Slipping of the blade upon the wheels through not enough strain. It is better to have too much strain than too little.

Crystalizing the teeth by using too hard an emery wheel or grinding off too much at a time.

Striking too heavy a blow.

Hammers with imperfect faces.

Hammering too near the edge.

Uneven teeth (not of uniform length.)

Dull teeth.

Dust accumulating on the wheels under the blade.

Wheels imperfectly lined.

Track out of line with the blade.

Uneven track.

Accumulation of dust on the track.

Not removing strain when shutting down mill at night, noon, or for a period of an hour or more.

Using blade of too heavy gange for the diameter of the wheel.—From J. A. Fay & Egan Company's Brochure.

THE COUNTRY SAW MILL IN WINTER.

Heigh ho! for the country saw mill
With its noise and busy throng,
Where the steam rolls about and the saws sing out
In a concert all day long.

The skidway outside is heaped up high,
And the teams are moving around,
The farmer will scurry and get in a flurry
If no room for his load can be found.

He dumps all his logs on the rollway,
Chalks his name on their ends, "what a scrawl!"
Such letters indite and queer figures write
The sawyer can't read them at all.

Some 2x4 scantling, 500 ft. plank,
And some battens, wants old farmer Lynch,
A dozen good braces he carefully traces,
And marks all the balance for inch.

The boys in the mill are busy as bees,
Rough and ready, a good hearted crew,
They work round the saws with a "cud" in their jaws
And "stay with it" all the day through.

Its Jack holds his hand on the lever so firm,
His eye on the cut keenly gazes,
For he knows there's no fun when the saw 'gins to run
And everything then goes to "blazes."

And tail sawyer Jimmie with rubbers and socks
Hops 'round like a hen on a griddle,
He can dance you a jig, take a slab off so big
That the log is nigh cut through the middle.

And Gillespie cuts up all the slabs into wood,
And fires it clean out of the mill;
He can edge to a dot, cut out all the rot
From an inch board up to a sill.

And Tom is the fireman so trusty and strong,
His face how it proudly does beam;
For his engine may puff, she's thro' it like snuff,
With sixty-five pounds of dry steam.

Oh give me the days in the old saw mill,
With its noise and busy throng,
Where the steam rolls about and the saw sings out
So cheerily all day long.

—THOS. GIBSON, Wroxeter, Ont.

It is understood that Mr. W. R. Beatty, M.P. P., of Parry Sound, Ont., has been appointed manager of the large timber interests in Nova Scotia recently purchased by the Beardmore Company, of Toronto, and that he will take up his residence in the eastern province. Mr. Beatty has had a wide experience in the lumbering business.

There passed away at Pembroke, Ont., recently, Mr. Alex. McDougal, one of the pioneer lumbermen of the Ottawa valley. When a young man he took rafts of square timber to Quebec, operating on the Madawaska and Bonnechere rivers, and afterwards becoming agent for the late John Egan at Quyon, Que. He was 87 years of age, and for some time had lived retired.

As we go to press it is learned that Mr. A. F. E. Phillips, representative in Winnipeg of the Brunette Saw Mill Company, of New Westminster, B.C., is seriously ill with appendicitis.

Mr. G. H. Moulthrop, of the Moulthrop Lumber Company, which bought the saw mill on John's Island, Georgian Bay, has removed from Bay City to John's Island, where he will remain for the summer.

NEW TIMBER REGULATIONS.

New regulations have been adopted by the Dominion Government for cutting timber on Indian lands in Ontario. They provide that all licenses issued or renewed after April 30, 1901, shall contain the "manufacturing clause," stipulating that all pine timber shall be manufactured into lumber and all pulpwood into pulp or paper in Canada. The penalty for infraction of the regulations is suspension of the license. To prevent a breach of the regulations any logs or pulpwood suspected of being intended for export may be seized by the government officers, and if security for home manufacture is not given, may be sold by auction.

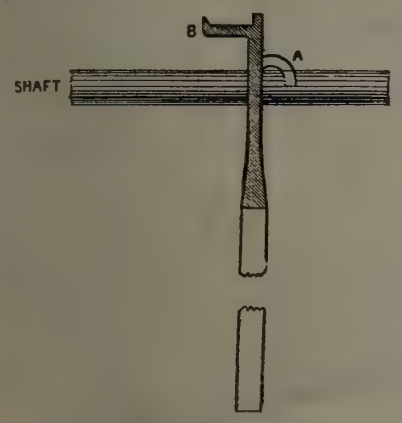
BELT HOOK.

So many accidents have happened to workmen engaged in riveting belts which are hanging on a revolving shaft through the men being drawn up by the loose belt and dashed to pieces, that in England the inspector of factories in his last report recommended strap hooks being used while the belts are off the overhead pulleys. In large engineering works and other shops it has been pointed out that it would be a large undertaking to supply a hook to every belt. On this account he has designed a simple tool which can be used with any belt and which has met with approval



BELT HOOK.

wherever it has been tried. It comprises, as shown in the cut, an iron hook, A, at right angles to a bar, B, on which the belt rests whilst the hook is on the shaft. This can be fitted to a pole of wood and the belt thus raised off the revolving shaft whilst it is being spliced or riveted.

FRENCH DEMAND FOR LUMBER.

United States Consul Skinner, of Marseilles, in a report to the State Department upon the demand in France for walnut-logs, says that that country presents a good market for American lumber. He says: "All kinds of exotic woods in logs are admitted free of duty; squared lumber is dutiable at the rate of 24 cents per 220 pounds, while walnut is the timber most in demand and the most difficult to obtain. There is also an opportunity to dispose of ebony and mahogany, if Americans are at present prepared to export these woods from our colonial possessions. Present prices are about $19.30 per 1,308 cubic yards for logs, and $24.12 per 1,308 cubic yards for sawed lumber." All of the American pine imported at Marseilles is purchased from London middlemen. I have had occasion to investigate this matter, and discover that the occasional efforts made in this city to buy direct have been extremely unsatisfactory. Two firms in London are reported to me to be the actual importers of fully 80 per cent. of all the American lumber shipped to England and the Continent. These two houses sent their representatives into the Florida and other pine regions, who supervise every detail preceding the actual departure of the lumber for its final destination. What is true of the lumber trade is also more or less true of many other commercial lines, and I think it would surprise a great many American business men if they could realize the extent to which they are dependent upon British middle-men for their foreign trade."

TRADE NOTES.

The Imperial Lumber Company, of Toronto, have opened a branch for Great Britain at 41 Corporation street, Manchester, under the management of Mr. L. A. Grant.

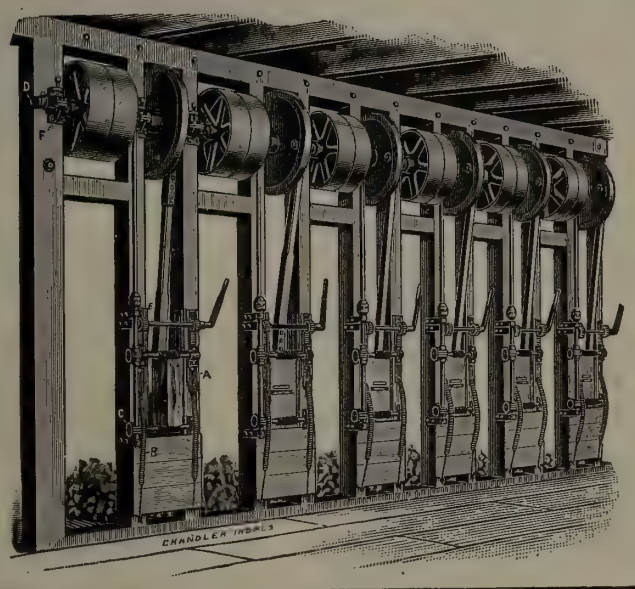
W. B. Mershon & Company, of Saginaw, Mich., report an excellent demand for their band resaws. Last week they received an order from Firstbrook Bros., of Toronto, for four of them to be installed in their new mill at Penetanguishene.

The Thos. Forrester Co., of Montreal, are sending out to saw mills and sash and door factories, a useful combined calendar and standard price list of beltings. If any of our readers have failed to receive a copy they are requested to write the company for one.

John Palmer, of Fredericton, N. B., is reported to have purchased the business and stock in trade of Charles D. Dickenson, manufacturer of larrigans, etc., of Woodstock, N. B. It is said that the deal includes the sole right to manufacture and sell in Canada the Henderson patent moccasin.

Robert Bell, of the Seaforth Engine & Machine Works, Seaforth, Ont., has recently issued new catalogues of his Bell automatic self-oiling engine, "Standard" tubular stationary boiler, No. 0 saw mill machinery, and other well known lines which he manufactures. He is now building gasoline engines.

The Best Excelsior Machine in the World



When two or more knives are run with one belt, all must stop when the belt is stopped to set bits or from any other cause. Our Machine has a belt for each knife, hence but one knife stops at a time. This great advantage should not be overlooked by purchasers. Time is money. Our Machine cuts more excelsior in a given time than any other machine. Get our circulars and prices.

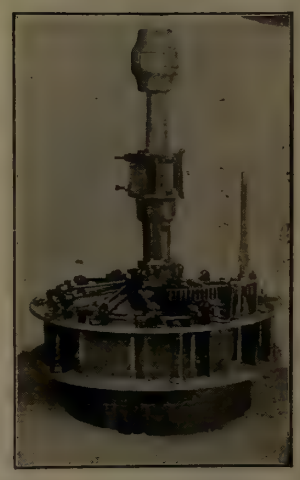
THE LEFFEL AND VULCAN TURBINES



POSSESS DISTINCTIVE MERITS, which should have the attention of water power owners 1st—They are strongly and carefully built. 2nd—They are economical in their use of water. 3rd—They develop more power in proportion to the water used than any other Turbine built. Mr. J. D. Flavelle, of the Flavelle Milling Co., of Lindsay, writes us under date of March 7th as follows:

"Referring to the two 74" water wheels (Leffels) purchased from you during the past year. As far as we have had an opportunity of testing, they have done their work excellently, in fact are doing more than you guaranteed them for. We took a test of the power they were developing with a head of water of 3 ft. 10 in, and they developed very close to 100 h. p. We are thoroughly satisfied with same."

This letter is but one of many such.

R. H. SMITH CO., LIMITED

St. Catharines, Ont.

We are the Sole Manufacturers of Saws under the

Simonds' Process

in the Dominion of Canada.

There is no process its equal tor tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. **All such Claims are FALSE,** as the patentee in the U. S. and ourselves are the only firms in the world who use it.

MILL STREAM, QUE., on I. C. R'y, December 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—Driving a 20 in. 13 gauge saw into frozen hardwood, using a 9 in. 4-ply belt, if it can be done satisfactorily, is a very severe test. Your saws have stood that test better than any I have tried. I have been experimenting with different makes—both home and imported—during the last five years, and give yours the preference. Last order is just to hand and will report on them by and bye.

Yours very truly, JAMES McKINLAY.

CAMPBELLTON, N.B., Nov. 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—In regard to your Shingle Saws, you can say that I have been using Shingle Saws of your make (Simonds) for the past four years, and they have given good satisfaction. I am running nine machines and use a good many saws, but have never had a saw yet that did not work satisfactorily. Before using your saws I used saws of American make, which worked well, but after giving your saw a trial have continued to use yours, as they are cheaper, and in regard to working qualities are all that is needed.

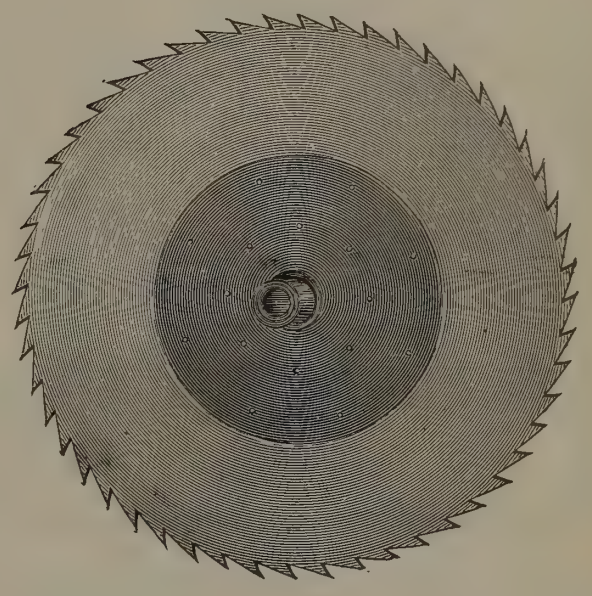
Yours truly, KILGOUR SHIVES.

CLAVERING, ONT., May 3rd, 1897.

R. H. SMITH CO., LTD., St. Catharines, Ont.

GENTS,—In reply to your letter asking me how I liked the 62" SIMONDS Saw, I must say in all my experience I never had a saw stand up to its work like the one purchased from you last month. Having used saws for the last 22 years, and tried different makes, I can fully say it is the best saw I have ever had in my mill, and would recommend the SIMONDS' Process Saws to all mill men in need of circular saws. Yours truly, W. G. SIMMIE.

P.S.—I am sending you my old saw to be repaired; please hammer to same speed as new one. W.G.S.



THE "LEADER" CROSS-CUT SAW

These Saws are made from the best DOUBLE REFINED SILVER STEEL, warranted four gauges thinner on back than front, and the only Saws on the market that are a perfect taper from the points of the teeth to the back, and require less Set than any other Cross-Cut Saw.

They are tempered by the Simonds' Patent Process, insuring a perfectly uniform temper throughout the plate, and stand without a rival as the BEST, FASTEST, AND EASIEST-CUTTING SAW KNOWN. A gauge to regulate the clearing teeth is furnished with each saw.

Directions for Setting and Filing are plainly Etched on every Saw. None genuine without our Registered Trade Mark as shown in cut.

THE "LEADER" SAW SWAGE

Made in 3 Sizes—$2.00, $2.50, $3.00 et.

OUR PRICES ARE RIGHT. KINDLY ALLOW US TO QUOTE YOU BEFORE PURCHASING.

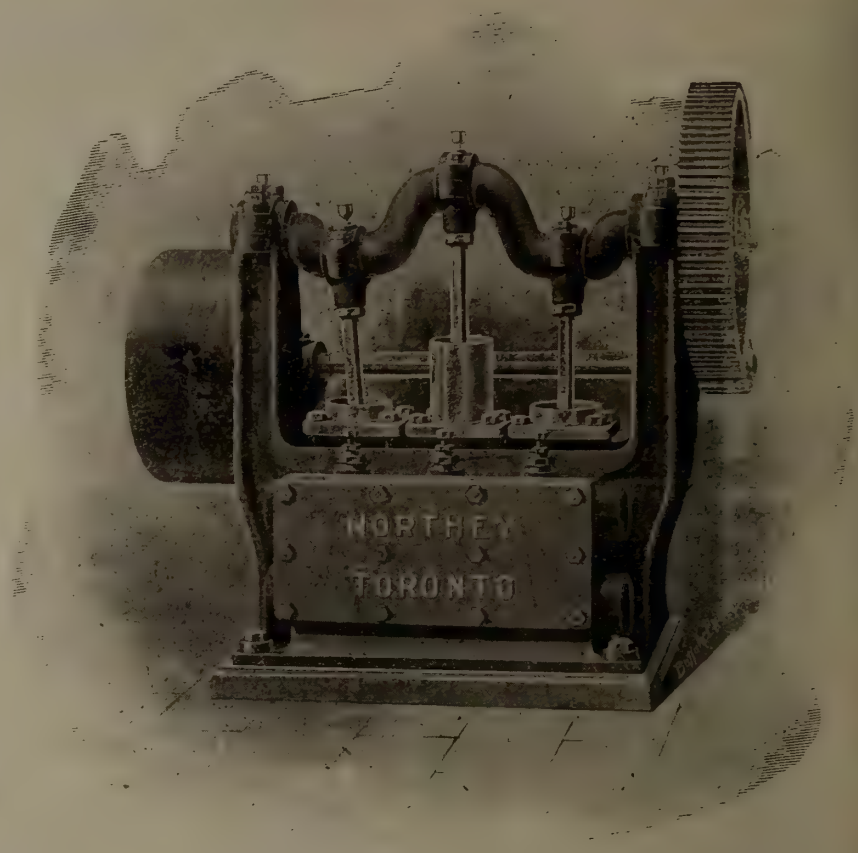
R. H. SMITH CO., Limited, St. Catharines, Ont.

Northey Triplex Power Pump

FOR BOILER FEEDING AND GENERAL PRESSURE PURPOSES

In the Northey Triplex Power Pump we offer a machine put together with the skill brought by years of experience in pump building, and with full provision made for the varied demands likely to be made upon a pump of this character. A feature of value is that the three cranks are placed 120 degrees apart, thus giving a practically constant flow of water—minimizing strain on pump and economizing power. The pump can be readily repacked and taken up, and all details are carefully worked out. It can be conveniently operated by electricity, by water power, or by belt from engine. Different styles and sizes made to suit all duties.

WE ARE MANUFACTURERS OF OVER FIVE HUNDRED DIFFERENT STYLES AND VARIETIES OF STEAM AND POWER PUMPS FOR STATIONARY AND MARINE PURPOSES. WE INVITE ENQUIRIES FROM ENGINEERS, MINE SUPERINTENDENTS AND OTHERS FOR THEIR REQUIREMENTS IN OUR LINE. CATALOGUES AND SPECI FICATIONS FURNISHED UPON REQUEST.



We are also manufacturers of the Northey Gas and Gasoline Engine which has proved to be the handiest and most convenient power for small or intermittent power users in the market. Suitable for machine shops, pumping and electric light plants, etc. Write for illustrated descriptive booklet.

VOLUME XXI. NUMBER 7. | TORONTO, CANADA, JULY, 1901 | TERMS, $1.00 PER YEAR Single Copies, 10 Cents

THE TIMBER SUPPLY FOR THE BRITISH ADMIRALTY.

Only a small portion of the timber used by the British Admiralty in the construction of ships, dock-yards, etc., is home grown. The bulk is imported from Canada and the North of Europe. There are kept constantly in the employ of the British Admiralty two timber inspectors, Mr. William J. Rogers being the present inspector for Canadian timber, and Mr. C. Nichols being detailed for duty in the Baltic.

Being accorded an interview with Mr. Rogers, who is now in Quebec, the writer learned that it has been his custom since 1895 to leave England each year in the spring for Quebec, this being his seventh season. He returns to England in the fall after all the timber is shipped, and during the winter is employed in the inspection of foreign timber, such as teak, mahogany, etc. Previous to being despatched to Quebec for duty he was stationed in the Baltic for five seasons. Both Mr. Nichols and Mr. Rogers were shipwright officers previous to their appointment as timber inspectors, and were employed in H. M. dock-yards, it being considered that this experience fitted them admirably to select the timber required for building war ships.

Tenders for the timber contract, Mr. Rogers states, are usually asked for early in each year from all firms who, in the estimation of the Admiralty, are capable of executing the contract satisfactorily. This season the firm of R. R. Dobell & Company, of Quebec, were the successful tenderers.

The duties of Mr. Rogers at Quebec are to inspect the timber before it is shipped. While it is afloat it is turned over so that he may see all four sides, every facility being rendered for the proper examining, measuring and marking of the timbers. The timber is measured by caliper and the contents given in cubic feet, and is usually purchased at so much per load of 50 cubic feet. The pine and spruce deals are inspected in like manner, and although classed as first quality, may be subject to rejection on account of sap, knots, etc.

The quantity of timber included in the Canadian contract this season is as follows :

Waney Pine	130,000	cubic feet.
Red Pine	115,000	"
Rock Elm	15,000	"
Pine Deals, first quality	80	standards.
Spruce Deals, "	390	"

There is also obtained, from British Columbia, spruce deals for oars. These are selected at Vancouver and carried by rail to Quebec, then loaded on ship and taken to Davenport, which is the dock-yard where oars are manufactured for the British navy. The amount required annually is about 74 St. Petersburg standards. The lengths range from 9 to 18 feet ; the timber must be absolutely perfect and commands a very high price.

The timber obtained from the Baltic is all of one kind, known in the trade as Dantzic fir. It is much cheaper than Canadian fir, and is used for all kinds of rough work in ship-building, such as ground blocks for building on, shores for docking, etc., very little being used in the construction. Logs are taken 12x12 inches to 18 feet and up, and average 13 inches x 14 inches x 24 feet. The quantity is about 4,000 loads. About 300,000 superficial feet of stage deals, 2 inches x 12 inches, is also required.

Teak, mahogany, sabique, greenheart and cedar are selected generally in the London docks from shipments already landed. Teak is obtained from Moulmein and Rangoon, in Burmah, and is very suitable for steel ship-building. Being of an oily nature it does not rust when coming in contact with the steel, is very durable, and has largely superseded the use of Dantzic deck deals. The quantity used annually is about 4,000 loads. The mahogany is obtained from Belise, Honduras, and Cuba, and is used principally for furniture and cabin fittings, the quantity being about 200 loads. A very small quantity of cedar, greenheart and sabique is used.

The English timber used by the Admiralty includes oak, elm and ash, for general purposes. The inspection of this timber and converted material for foreign dock-yards at Malta, Hong Kong, Sydney, etc., keeps the timber inspectors well employed during the winter months.

WILLIAM A. ROGERS,
British Admirality Timber Inspector.

BAND VS. CIRCULAR RE-SAW.

BY AUG. J. BEDUHN, IN THE WOOD-WORKER.

In the January number Mr. N. L. Jackson gives his opinion of the relative merits of circular and band resaws. He seems to have had considerable experience with these machines, and I heartily endorse most of his views. My own experience is that the band resawing machine is far ahead of the circular. I must, however, beg to differ with Mr. Jackson as to the feed of the band in 14-inch lumber. To cut 100 feet per minute a saw 25 feet long and running 9,000 feet per minute, in soft wood, must cut a fraction over 3 inches at each revolution. Men who can make 4 or 5-inch saws cut 100 feet per minute in 14-inch lumber are certainly "Jim Dandies." In fact they are so scarce that in an experience of eleven years as band saw filer I have never had the pleasure of meeting any of them. The circular resaw with its 40-feet feed per minute would certainly not be in it. I may be a little slow, but would like very much to see it done. The best I have been able to do is to make a 22-gage 4-inch band cut 3 inches at each revolution in 11-inch pine lumber, "large knots barred," for about two hours; after that I have to slack up on the feed to do good work. The saw that takes the most feed stays sharp longest.

Not long since I was called to a neighboring mill to fit up the saws for a band resawing machine. The foreman looked on while I hammered the first saw. To start a conversation I asked him what makes saw teeth dull. He looked at me, but said nothing. I repeated the question and explained that I meant it. "Well," said he, slowly, "cutting the lumber, I suppose." I told him it was the friction, pointing out that all the high-speed saws with slow feed had to be sharpened oftener, yet only did half as much work as other saws with proper speed and fast feed. He acknowledged the fact.

I am also running a circular resaw and feed it 70 to 80 feet per minute in stock up to 8 inches wide, running the machine with a 5-inch belt. If necessary, could easily feed 100 feet per minute in same stock by using a wider belt. The largest saw used on this machine is 32-inches in diameter, 16-gage at rim.

As to accuracy in sawing we must give credit where it belongs. It is a fact well known to filers that when a board comes from the machine not evenly split the operator almost invariably blames the saw. He will go to the filing room and announce that he "can't do a thing with that saw."

Not long ago the man running the circular resaw of which I have charge came to me and said, "If I should run that saw another minute it would fly into a thousand pieces and kill seventeen men. Why, it snaked so I could see it smoke!" I asked what he was sawing. He said 10-inch dry basswood. I went with him and asked him to pick a straight board out of the pile. This he could not do. I then explained that it was the lumber, not the saw, that was to blame. The space from the feed rolls to the top edge of saw in 10-inch lumber, is about 15 inches. In this lot of basswood were boards that had crooks as short as 6 inches, and the saw, cutting a straight line, couldn't very well run in the centre where these crooks occurred. The operator didn't see any more "smoke" from that saw.

The band saw has a great advantage at this point, because it stands close up to the feed roller and the lumber has no chance to shift. A band can also be run with less power than a circular, because it takes less saw kerf. In resawing with both machines, say 75 feet per minute, each sawing same width and grade of stock, it would require about one-third more power to run a circular; even were the circular taking the same kerf as the band it would require more power, on account of side friction, which is much greater than with the band saw.

I will take off my hat every time I meet a man that makes a 4 or 5-inch band saw split 14-inch lumber at the rate of 100 feet per minute.

An interesting experiment is being made under the auspices of the Dominion Department of Marine and Fisheries, in connection with reforestation. Over 81,000 trees have been planted on Sable Island, and their progress in the shifting sand to be found there will be watched with interest. If the planting should prove successful the island will become more visible from sea, and the soil will be rendered more cohesive.

MR. ALEX. LUMSDEN, M.P.P.

A gentleman holding large interests in and having a thorough knowledge of the lumber industry of Ottawa and the Ottawa Valley is Mr. Alex. Lumsden, M.P.P. Since 1882 Mr. Lumsden has held the exclusive contract of driving the logs down the Ottawa river from the Temiscaming lake to DeJoachin Falls, a point about 42 miles above Pembroke. From the latter place the logs are hauled by the Upper Ottawa Improvement Company, which conveys them to the Ottawa mills. In 1882, when Mr. Lumsden started in the business with about 100 men, he handled 800,000 pieces of timber, ties and logs. During the past season over 2,000,000 pieces were handled, including a large amount of pulp wood, dimension timber and ties. No less than 340 men were employed, with 10 steamers, from April to December of last year.

The lumbering industry centering in Ottawa, Mr. Lumsden states, is good for many years to come. Despite the fact that a largely increased area of limits has been cut over, there is no apparent decrease in the volume of business done in the river driving. During the past season a large amount of dimension timber was floated down. Nearly all this was red pine, for which there is at present a good demand in the English market. Another feature of the business is the marked increase in the amount of pulp wood handled. This season about 6,000 cords were handled for the E. B. Eddy Company alone. Last season only a few hundred cords were handled.

Mr. Lumsden looks for a continued large increase in this particular branch of his business. Next season it is understood Mr. J. R. Booth will have considerable pulp wood forwarded, as he will cut a quantity during the winter months.

Since Mr. Lumsden started driving logs, the lumbering operations have been extended a distance of about 150 miles further back. Saw logs are now being cut, where in former years square timber was taken out, and the adoption of structural steel in ship-building, railway work, mining etc., has, according to Mr. Lumsden, dealt a severe blow to the square timber industry, which on this account can never approach its former great dimensions. About the only square timber now handled is that of the smaller dimensions and highest quality used for ship decking.

The principal streams on which Mr. Lumsden works are the Ottawa at Quinze, the Blanche, Ottawa and Montreal rivers, Gordon Creek, Kippewa lake, Lake Temiscaming, Mattawa, Magnicippi and Dumoine rivers. Logs are handled for the following firms: J. R. Booth and W. C. Edwards, Ottawa; E. B. Eddy & Company, Hull; McLachlin Bros., Arnprior; Gillies Bros., Braeside; J. & B. Grier, St. Annes; Hull Lumber Company; McLaurin & McLaren, East Templeton; the Hawkesbury Lumber Company; the Pembroke Lumber Company and A. & P. White, of Pembroke. Mr. Lumsden also operates a large saw mill at Lumsden's Mills, on the Ottawa. His steamers are engaged extensively in carrying freight and passengers on the Upper Ottawa as well as in towing and handling logs. Many of the latter are brought over a stretch of 200 miles of river and lake.

The objective point is Lake Temiscaming, which is 142 miles above Pembroke. The logs are floated loose through the rivers, but are brought together in booms in the lakes, some of which are over 60 miles in length.

Mr. Lumsden has expended a large capital on improvements made necessary by his extensive business. Over $150,000 was spent on Gordon Creek alone, this being an artificial outlet from the south end of Lake Kippewa. The creek is about eight miles long and connects several small lakes. By its improvement a saving of nearly 60 miles is effected in the transportation of the logs. Mr. Lumsden also has shipyards on both the Kippewa and Temiscaming lakes, where he builds his own steamers. He has built docks, piers and booms along the lakes and rivers he traverses, representing an outlay of over $250,000; this includes steamers also.

During the season, which lasts as long as there is open water, operations are carried forward. A patrol is established the entire length of the waterways and the men are constantly engaged keeping the logs on the move. The largest tows handled by steamers take in about 35,000 logs. The past season was one of the best Mr. Lumsden has experienced, but in 1896 he also had a large run of logs numbering over 2,000,000. The capital represented by the past season's drive will total on a conservative estimate over $2,000,000.

Mr. Lumsden is the only son of the late John Lumsden, well known to early residents of Ottawa. He was born 57 years ago and was educated in the public schools and Grammar School at Ottawa. In 1863, at the age of 20, he started in the lumber business. For 17 years he was engaged by Currier & Co., the well known lumber firm, first measuring logs on the Gatineau limits, and afterwards as shipper at the saw mills in Ottawa now operated by W. C. Edwards & Company. Before he severed his connection, Mr. Lumsden had risen to the position of general manager of the business. Associated with Currier & Company, at this time, was another well known lumber firm, McLaren & Company.

Mr. Lumsden has always been eminently successful in his business affairs, and at present he is identified with several of the leading enterprises, including the Ottawa Electric Co., the Electric Railway Company and the Ottawa Car Company.

In 1896 Mr. Lumsden was elected by his fellow citizens as one of the Capital's representatives in the Provincial Parliament at Toronto. Mr. Lumsden succeeded the late Hon. E. H. Bronson in the Liberal interests and has made in the legislative halls a mark equally as high as that he gained in the business world. Mr. Lumsden occupies a well appointed residence on Stanley Ave., Ottawa, overlooking the Rideau river. On the spot he was born in the old family homestead. As a man of sound successful business methods he is esteemed throughout the Ottawa Valley.

TESTS OF BOILER PLATES.

General mill machinists, mechanical and steam engineers are frequently required to test boiler plates. The only way to have any surety in the matter is to test the plate thoroughly. In regard to the brands, the same name or mark on boiler plates may mean a very different quality with different makers. Strength is not the only quality to be sought in a boiler plate, it must be tough and yet ductile, in order to stand the variation in strains to which it will be subjected while in use. Many plates which show a high strength are not suitable for use in a boiler, on account of being brittle and, therefore, not able to undergo the changes in dimensions which a plate must go through, owing to expansion and contraction, and, moreover, such plate would, in case of accident, give way very suddenly with no warning. A very good method is as follows: Support the plate, horizontally, at its four corners and strew the upper surface with fine sand. Tap the plate lightly on the under side; where there are defects the plate will not vibrate and the sand will remain stationary. Tests of this nature, however, cannot be relied upon to bring out many defects which are quite sure to become known in the working.

YUKON TIMBER REGULATIONS

With a view to prevent a large area of timbered lands in the Yukon Territory being acquired for speculative purposes, provision was made in the Timber Regulations, established by the Governor-General in Council on February 28th, 1898, that not more than five berths of five square miles each should be granted to any one person or company. Some of the persons and companies who have obtained five berths have now applied for additional berths, from which to cut timber to be manufactured at their saw mills, which applications, under the existing regulations, cannot be granted. To meet the situation, it has been decided that when an applicant who has acquired five berths can show that he actually requires additional timber for manufacturing purposes at his mill or mills, the provision restricting the granting of more than five berths to one applicant will be waived.

ERRATA.

By a typographical error the paper on "Chemical Wood Pulp," which appeared in the last issue of the "Lumberman," was credited to J. A. McCew. The author of the paper was J. A. DeCew, of Fenelon Falls, Ont. He spent last winter in post graduate work at the School of Practical Science studying the chemistry of woods in general, including destructible distillation. Mr. DeCew is desirous of obtaining further practical experience along the above lines.

A belt made up of too many pieces is rather doubtful economy. Loss of initial power, increased risk of damaging breakdowns, and lost time from repairs, make it cost more than a new belt.

The Nipegon Pulp & Paper Company have decided upon a site for their pulp mill. It will be located about ten miles up the Nipegon river.

FOREIGN MARKETS FOR LUMBER.

The following extracts are taken from the annual report of the High Commissioner for Canada :

SPOOL WOOD.

I have had a letter from a firm which imports spool wood largely, and they tell me that on the whole the quality of the imports last year was poorer than usual. They seem to think that the trade might be developed considerably if the producers would take the trouble to satisfy the requirements of the importers, from whom better prices might, in those circumstances, be obtained. The following is an extract from a letter on the subject :—

'A serious drawback is the want of up-to-date loading appliances, which, on account of the uncertain weather experienced by ships at roadstead anchorages, leads to claims for demurrage. Importers naturally decline to render themselves liable for such risks. If a few steam lighters or barges, capable of loading 100, 150 or 200 tons at a time were available by shippers at a reasonable rent or freight, the method of loading would be vastly improved, or if even a few steam tugs were available to tow the shipper's boats from shore to ship at moderate cost, a larger trade would be eventually developed. The steam barge or lighter would be preferable to the tug boat because of the charges for the services of the latter in the St. Lawrence.'

CASEBOARDS AND BOX SHOOKS.

As showing the opening that must exist for a greatly extended business in this class of manufactured timber, I may again quote the terms of a letter that reached me in the autumn from an important firm of explosive manufacturers, who use large quantities of such goods for their packing cases :—

'We observe in the 'Board of Trade Journal' of the 13th ultimo an enquiry from a firm in Nova Scotia who are prepared to quote for box shooks. We are users of these goods, and we beg to give you the following particulars of our requirements which we shall be obliged if you will kindly communicate to the firm in question, and ask them to be good enough to send us their lowest quotations per case, delivered free at Glasgow, or preferably, through to Stevenston, Ayrshire. Our friends, the Hamilton Powder Company, 103 Xavier Street, Montreal, have samples of our caseboards beside them, and, if the firm in Nova Scotia will kindly communicate with them, they will receive further information which will guide them as to the nature of the goods we want.

'The particulars of our requirements are as follows, namely :

Number.—The probable total number of caseboards in shook form required per annum will be such as will make 120,000 to 140,000 cases, but without guarantee.

Material.—The caseboards may be of white or red pine, or Quebec spruce, but must be thoroughly seasoned, and of good, sound quality, free from cracks, shakes, loose knots, or other defects.

Note Well.—The wood must be clean sawn, and there must not be any so-called outside wood, which is always rough, discoloured or dirty. The edges must be square.

Thickness.—The tops, bottoms, sides and ends are each to be delivered 5/8in. of an English inch thick. At the same time the company are prepared to consider also an offer for 'nominal' thickness, which impression is understood to mean not less than nine-sixteenths of an inch.

Tops.—The tops to be all in one piece ; or, alternatively, of two pieces of the same kind of wood, well jointed in the same way as the bottoms, and made perfectly flat so as to receive equally the Company's brand.

Bottoms (Sample Joint).—The bottoms may be made of two pieces, with a well made and substantial feather-and-groove joint not less than 3/8-in. deep, carefully glued all through ; the proportion and thickness of feather-and-groove to be as per sample pieces herewith.

These parts are not to be made from pieces of two different kinds of wood ; thus, red pine should be joined to red pine, and white pine to white pine.

The pieces used for tops or bottoms must all be uniform thickness, parallel, and joined exactly, so as to get a plane surface without a ridge caused by one piece being slightly above the other at the joint.

Shrinkage.—To allow for shrinkage in the boards when stored for a length of time, the tops and bottoms must be supplied 1/4in, wider than is necessary for the specified size of the case.

Sides and ends.—The sides and ends to be each in one piece without joints.

In all pieces the best side of the wood to be the outside, but the inside must be smooth to obviate injury to the india-rubber lining that is placed inside the finished case.

Dovetailing—The sides and ends must be well and carefully dovetailed, so that any two ends will fit into any two sides.

There are to be six dovetailed pins, and these so spaced that there will be a full width pin at any top or bottom corner, as half-width pins break away in closing.

The end wood of all the dovetails must be as nearly as possible flush with the surface of the pieces they go into.

Without Dovetailing.—Alternative offers are desired for the sides and ends cut plain at the edges and not dovetailed.

Size of Case.—The measurements of the plain boards are to be as follows :—Tops and bottoms 29in. x 11 in.; sides, 29 in. x 6 7/8 in.; and ends, 10 3/4 in. x 6 7/8 in.; so that after dovetailing and when all the parts are put together, they should form a case 27 3/4 in. long, 9 1/2 in. broad, and 6 7/8 in. deep, inside measurement and in English inches.

The detailed sizes of tops and bottoms stated above allow for the extra 1/4 in. width referred to under "Shrinkage."

The above detailed sizes are for wood 5/8 in. thick. If wood of only 9/16in. thick or nominal thickness used, the sizes will then be as follows :—Tops and bottoms, 27 7/8 in. x 10 7/8 in.; sides, 28 7/8 in. x 6 7/8 in.; ends 10 5/8 in. x 6 7/8 in.

Sample with Tenders.—Offerers to submit one set of caseboards, as samples of what they quote for.

MAPLE ROLLERS.

At the request of a correspodent in Ontario, I made some further investigations in regard to these goods. The following are the sizes required by one important firm of buyers :

26 x 5¾	Square or 5¾	diameter round or	octagon.
22 x 5¾	"	"	"
29 x 6½	"	"	"
22 x 6½	"	"	"

These may be in lengths 2 or more times 26 inches, etc., as most convenient to the mill, and must be delivered sound on the quay and free from heart or knots. The opinion has been expressed by a large manufacturer of washing machines that the trade in Canadian rollers could only be satisfactorily done by the exporter having an agent on the spot to look after his interests here. In many cases the rollers are examined before they leave the docks, and the importer invariably rejects those that for certain reasons are considered defective. It often happens that 20, 30 or 40 or even 50 per cent. of the blocks are rejected as worthless after careful selection has been made on the other side. The price varies from about 1s 4d to 1s 7d, but the number of rejected pieces makes the ultimate result of a consignment exceedingly problematical.

COMMERCIAL WEIGHT OF WOODS.

A QUESTION of very great importance to lumber shippers as well as to railroads, is the commercial weight of certain woods. It is frequently the case in loading cars that persons who are unacquainted with these things, will overload cars. When the over weight is discovered in time, the railroad wil refuse to haul cars that are loaded beyond their registered capacity, but, as is often the case, the overweight is not discovered until the car, or cars, are far from the shipping point, and then the railroads proceed to shift a part of the carload to another car. This entails loss of time and considerable expense. The National Hardwood Lumber Association, at its last meeting in May, 1901, adopted the following as the standard or commercial weights to be observed by the railroads, and themseves as shippers.

ESTIMATED WEIGHTS OF LUMBER PER 1,000 FEET.

	Dry. Lbs.	Green. Lbs.
Black Ash	3,300	4,500
White Ash	3,500	4,500
Beech	4,000	6,000
Basswood	2,400	4,000
Birch	4,000	5,500
Butternut	2,500	4,000
Cherry	3,800	5,000
Chestnut	2,800	5,000
Cypress	3,000	5,000
Cottonwood	2,800	4,500
Rock Elm	4,000	5,500
Soft Elm	3,000	4,500
Gum	3,300	5,500
Hickory	4,500	6,000
Mahogany	3,500	4,500
Maple	4,000	5,500
Oak	4,000	5,500
Poplar	2,800	3,800
Sycamore	3,000	4,750
Walnut	3,800	4,800
Yellow Pine	3,200	4,300

Of course the commercial world does not know absolutely dry lumber, and these weights are not absolute but intended only as a fair average.

The Ottawa & Gatineau Valley Railway Company have been refused an amendment to their charter to permit of engaging in the manufacture of pulp.

CANADIAN EXHIBITORS AT GLASGOW.

IN the Canadian Pavilion at the Glasgow Exhibition there are 38 exhibitors of timber and timber products, which may be classified as follows: Timber, 12; joinery, bobbins, etc., 17; carriages, wood rims for cycles, etc., 6; canoes and boats, 3. In the Timber Trades Journal we find the following reference to the individual exhibits, as well as the accompanying illustration :

The W. C. Edwards Company, Limited, of Ottawa, Ont., and Rockland, Ont., have a very well arranged collection of parqueterie flooring, deals and materials for sashes, doors, mantels, &c., and good specimens of sawn pine, moulding and joinery. The head of this extensive business is Mr. W. C. Edwards, M.P.

The Canadian Office and School Furniture Company, Limited, of Preston, Ont., displays a good assortment of hardwood panels.

W. H. Marcon, Parry Sound, Ont., shows cloth boards and some very beautiful veneers.

Ker & Harcourt, Parry Sound, Ont., have an interesting collection of spools, bobbins, turned boxes, etc.

John H. Groat & Company, of Grimsby, Ont., show on their stand fruit baskets, boxes and admirably worked walnut veneers.

The Lachute Shuttle Co., Lachute, Que., an extensive assortment of spools, bobbins, etc.

Adam Beck, London, Ont., combines an interesting collection of cigar boxes and cigar box stock, with some beautiful specimens of oak flooring.

The Columbia Handle & Lumber Co., of St. Thomas, Ont., show large quantities of hockey sticks, golf clubs, and kindred specialties. The British agents for this firm are Messrs. Lindsaw & Campbell, Broomielaw, Glasgow.

John Harrison & Co., Owen Sound, Ont., exhibit butchers' skewers.

The Hawkesbury Lumber Co., Hawkesbury, Ont., whose shipments are well and favorably known in British markets, have a representative collection of square timber, deals, section saw logs, etc.

Colin Reid & Bros., of Bothwell, Ont., in addition to lumber, have some very good specimens of handicraft in the shape of turned goods.

J. H. Still, St. Thomas, Ont., has a comprehensive lot of handles and whiffletrees.

The North American Bent Chair Company, Owen Sound, Ont., display a good collection of products of the forest and forest industries, and a variety of chair seats, backs, handles, &c. Their British agents are F. A. Lightbody & Co., 8 Gordon street, Glasgow.

J. S. Findlay, Owen Sound, Ont., maple rollers and blocks, and wood specialties.

The Sutherland-Innes Co., Ltd., Chatham, Ont., whose London and Liverpool agents are Sieveking, Podmore & Co., has a large collection of staves and hoops.

Scott, Taylor & Co., of Toronto, Ont., display brooms, whisks, washboards, &c.

T. S. Simms & Co., Limited, St. John, N.B., show corn brooms.

Dobell, Beckett & Co., of Quebec, Montreal, and Ottawa, display well assorted specimens of timber. This prominent firm of shippers has for local Scotch agents the firm of Singleton, Dunn & Co., of Union street, Glasgow, whilst their shipments are generally disposed of by their London house of R. R. Dobell & Co., of 110 Cannon street, London.

Gilmour & Company, of Trenton, Ont., also have a fine collection of timber specimens. Their agents for sales in the United Kingdom are Walcot, Limited, 17 Gracechurch street, London. A specialty recently introduced to the British market is a patent lumber, consisting of a thick veneer of hardwood worked on to a softwood core. This produces a beautiful effect of an extremely durable nature, much admired in doors, panelling, and interior house finishing.

EXHIBIT OF TIMBER PRODUCTS IN CANADIAN PAVILION, GLASGOW EXHIBITION.

Joseph Paquette, Montreal, Que., has an admirable exhibit of ornamental joinery, staircasing, balustrading and mouldings, together with some very perfectly finished specimens of joinery in the shape of Venetian doors and windows.

The McClary Manufacturing Company, London, Ont., exhibits desks and school furniture of admirable design and workmanship.

The Dodge Wood Split Pulley Company, of Toronto, Ont., has an interesting collection of wooden pulleys, made of all diameters and generally in from six to eight rings. The outturn of this company is as much as 200 pulleys daily.

Monsieur Henri Menier, of Paris, France, sends a representative collection of deals and trees from Anticosti, of which island he is owner. Probably the most reliable estimate of the average number of trees suitable for timber or pulp wood growing on the heavily wooded areas of Quebec would be that based on the figures supplied by M. Menier's surveyors and engineers in reference to this island. M. Menier's estimates of the area of forest land on Anticosti amount to 1,800,000 acres, and the average number of trees to 900 per acre. These figures are the result of an actual count on a great number of carefully measured acres, and as the Anticosti forests differ in no essential from those of Quebec and Ontario, M. Menier's careful surveys should be of considerable assistance in estimating outturns from the eastern provinces in specified areas.

In carriages, the firms of the Canada Carriage Company, of Brockville, Ont., the M'Laughlin Carriage Co., Oshawa, Ont., and J. B. Armstrong Manufacturing Co., Limited, of Guelph, Ont., all have very high-class exhibits of carriages such as are in ordinary use in the Dominion; a noticeable point is that though there are plenty of covered, there are no closed carriages shown.

In wheels, spokes and hubs R. Scott & Sons, of Galt, Ont., have a well-made lot of specimens.

In wood rims for cycles the Boston Wood Rim Co., of Toronto, and the Clarksburg Wood Rim Co., of Clarksburg, Ont., are well represented.

The three boat-building firms exhibiting are: The Peterboro' Canoe Co., of Peterboro', Ont.; Strickland & Co., Lakefield, Ont., (English agents, G. Strickland, West Dayton, Middlesex), and William English Canoe Co., of Peterboro, Ont. These boats and canoes of birch, cedar, and other woods are the acme of the boatbuilders' art. Light to look at, feathers to lift, perfect finish and graceful lines, they whisper here in the tumult of the busy city of the glories of the great lakes, the mystery of the forest, the rush and roar of the rapids, which accentuate the silences of the Great Lone Land.

QUESTIONS AND ANSWERS.

"Subscriber" writes: In the event of some studying to qualify as licensed timber culler, are the chances good for getting employment as such? What kind of an existence do cullers have in the way of lodgings, etc.? Where could I procure information as to what would be required by those seeking to qualify, as well as when the examinations take place, and the wages usually paid to cullers.

ANS: In the event of qualifying as a licensed culler, the chances of obtaining employment are reasonably good. It is necessary, of course, to first become a qualified culler before you can engage in the business of culling timber for the government. We believe that the board and lodging furnished in lumber camps has been greatly improved in late years, and may now be considered fairly good. Particulars regarding the qualifications necessary for an Ontario culler may be obtained from the Department of Crown Lands, Toronto. The examinations comprise a question paper and a practical test, the latter being the more important. It is necessary to have a thorough knowledge of the different kinds of logs and the quantity of lumber which can be obtained from each log, making the proper allowance for defects. Examinations are not held at regular intervals. So far this year none have been held in the province, nor have any been arranged for as yet. Last year several examinations were held, between 80 and 90 persons qualifying as cullers. The wages of Government cullers range from $40 to $60 per month and board.

CARE OF BELTS, PULLEYS AND GEAR WHEELS.

No mill foreman would willingly take a good, new rubber belt and rig up a scraper thereupon in such a manner as to wear the belt out as soon as possible. Still, that very same foreman will pass through the mill day after day where this wearing out process is being done all the time on a number of belts, and he never opens his mouth to protest or to order the scrapers taken off the belts. Not long ago, being near a mill, a very strong smell of burning rubber was noticed. The smell seemed to be continuous, and was noticeable at all hours of the day and night. Day after day it was the same, the odor being driven in one direction or another according to the direction of the wind at any given time, but by going all round the mill the burnt rubber smell was to be found at any time on one side of the premises. The cause was found to be the old story of shafting out of line and a piece of plank nailed up to keep the belt from running off its pulleys. There can be only one result of a contrivance of this kind, viz., to wear out the belt as quickly as possible. As destructive and mechanical a device as this is I will wager that out of ten mills, take them as they are listed, there will be nine that maintain one or more belt destroying appliances of this kind.

When a belt will not run well, instead of putting up a bit of board or plank, put up the millwright to align the shafting or to move the machine around so that the belt will run square. Failing this, and in some mills it is almost impossible to get such a thing done, put up a roll to bear against the belt, and let it run on bearings of its own (the roll), even in bits of pine wood, if there is nothing better to be had. Ten to one there is a bit of shafting in the storeroom, with a couple of boxes or hangers and a pulley to fit, that can be set up to guide that belt on to the pulley. Then the millwright may be laughed at when he says he has not got time to line up the shafting, and he may be told that it is a fact that millwrights work so awfully hard (?) that a drop of sweat from one of them will kill a toad!

Just one thing more in relation to the belt business. This thing is one not to do by all means. In the case where it happened there was a friction clutch driving a centrifugal pump by means of a belt. By some means the clutch was so adjusted that it would drive the belt and pump, slowly, it is true, even after the lever had been thrown to strike the clutch out of gear. In this case, instead of having the clutch properly overhauled, the very simple and belt destroying expedient of thrusting a wedge into the space between the lower side of the pulley and the pump frame was adopted. This caused the belt to stop with a bang on the instant, and to stay stopped dead until the wedge was knocked out with a hammer or some other mass of metal.

Among the things to do is that of bushing loose pulleys, of 2 or more feet in diameter, with roller bearings. The pulley is simply bored large enough to admit a cage of rolls around the shaft, the rolls in their cage are slipped in, and a thin collar or flange plate is screwed on to prevent the rolls from coming out. Then the pulley is ready for use, and I have seen pulleys arranged thus run continuously for several years without being oiled or being repaired. The roller bearing is also a mighty good thing for shafting especially line shafting, where the rolls have a fair chance to show what they are worth. As to the roller bearing for beating engine bearings, they are undoubtedly "things to do" when they are properly made and adjusted to the bearings. I have seen engines fitted with roller bearings run for years with less power than they consumed before the roller bearing was applied. And these bearings received absolutely no attention except to be kept well oiled. In fact, they were deluged with oil or grease, and literally were submerged beneath the surface of a body of oil all the time. The addition of roller bearings in this mill to ten beaters permitted the driving of another beater with the same power as formerly consumed by the ten originally in use.

Every machine manufacturer in the trade and every mill owner or purchasing agent should insist upon the use of the diametrical pitch in all gear wheels for the transmission of power. The age is too far advanced for either maker or purchaser to monkey with "three-inch pitch," "one-half inch pitch," or any of the sizes between them. Instead of all this nonsense use the terms of the diameter and the number of teeth. Thus: "One pitch," "sixth pitch," &c. In this way of stating the diameter of a gear it is understood that there is a stated number of teeth to each inch in diameter of the gear. Thus, a gear of thirty-six teeth, No. 6 pitch, will be exactly 6 inches in diameter of the pitch line. If there be thirty-eight teeth, the gear will be 6 1-3 inches in diameter. The gear of No. 1 pitch will have a tooth for every inch in diameter, and will always measure even inches across the pitch or circle. This method is very convenient for the calculation of gearing, also for the duplication of any gear that may be broken or worn out. For instance, supposing that there is a space of 10 inches between the centres of two shafts and it is desired to connect them by gears of No. 6 pitch. This gear is pretty nearly one-half inch pitch by the old method, as the space per tooth would be on a gear 1 inch in diameter, divided by 6 equals .524 inch—pretty nearly one-half. Once satisfied that a gear of this size of tooth will stand the work—and that part of engineering we will not go into in this story—it only remains to find how many teeth there must be on both gears to reach between the two shafts. As the distance is 10 inches, it is evident that two gears, each 10 inches in diameter, will just connect the two shafts. With a gear No. 6 pitch, 10 inches in diameter, there must be sixty teeth. Therefore, there must be 120 teeth used to connect the two shafts. Instead of dividing this evenly between two gears of equal size, it may be apportioned out in any manner desired, so that one of the shafts will run at a different speed from the other. Thus, it is only necessary to divide the total number of gear teeth by the number which represents the difference in speed of the two shafts. Thus: if the shafts are to run at equal speed, divide the 120 teeth by 2, and the answer, 60, will be the number of teeth required for each of the gears which will be equal in size. If one shaft is to run twice as fast as the other, then the gears must be in the ratio of four to one, and the total number of teeth will represent five parts, four of which are the number of teeth on the large gear, the one part being the number of teeth on the small gear. Thus: one hundred and twenty divided by five equals twenty-four. Four multiplied by twenty-four equals ninty-six, the number of teeth in each gear, so that the shafts may run four to one, and be exactly 10 inches apart. This method of gear calculation is far ahead of the old chord or circumferential pitch business, and once the paper mill man becomes accustomed to its use, he will have nothing to do with the manufacturer who clings to the old method of gear teeth calculation.

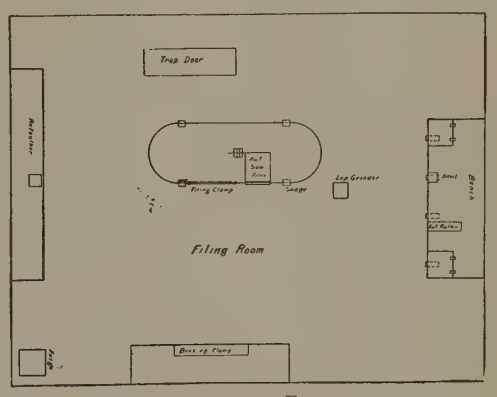
One more thing to do, and that should be done mighty quick. I refer to the high pressure simple engine which is puffing clouds of steam into the atmosphere just for the sake of helping to make rain for the world. At best only 10 per cent. of the heat contained in the coal can be transformed into work even by the best of steam engines, and where the exhaust steam is allowed to escape direct from the engine only about 6 or 7 per cent. of the heat value is made use of. There are many forms of jet condensers in the market which will enable the paper mill man to pull off one or two of the possible points between 6 and the 10 mentioned above. The exhaust jet condenser is little used in this country. It is a German institution, but can be had here. This appliance is only occasionally found in paper mills, but it is capable of adding 20 horse power to an engine of 150 horse power, with no expense whatever, provided there is a supply of water which can be drawn upon by the condenser. This appliance is really a sort of exhaust steam injector, which draws up the water with which the steam is to be condensed. It is different from the siphon condenser, for the reason that the water in that appliance is drawn up by the weight of a descending column of equal weight, while in the injector condenser the column of water is drawn up and supported by the injector action of the exhaust steam in the instrument. The condensation of a portion of the steam creates a vacuum which draws up water by removing the pressure of the atmosphere upon the top of the column, and the condensation of the same steam also draws along another portion of exhaust steam to be likewise condensed and robbed of its working power.

And now, just one more thing; this time both to do and not to do. That thing is the use of steam in the heating coils and circulations. When it is cold there is a very great temptation to put on more steam, even to let it blow through the pipes in order to get as much heat as possible. But that is the thing not to do. There is no heat to be gotten out of steam while it is passing through pipes in that matter. A pound of water in the form of steam contains about 1,000 or 1,100 heat units. If at a temperature of 330 degrees, 118 of the thermal units may be drawn out while the steam is blowing through the pipes, but there is carried off with it the 976 units of latent heat of vaporization which will become of use when the steam is condensed in the radiators or circulating pipes.—J. F. H., in Paper Trade Journal.

THE FILING ROOM.

In their little booklet entitled "Instructions on the Erection and Care of Band Saw Mills, Band Saws, Etc.," Messrs. J. A. Fay & Egan Company say regarding the filing room:

Locate the filing room, if possible, directly above the mill. The blade may then be conveniently and quickly lifted from the mill through a trap door into the filing



ARRANGEMENT OF A FILING ROOM.

room, and the blade to replace it can be easily lowered upon the wheels.

The filing room should be well lighted and free from vibration.

The sketch accompanying shows a nicely arranged filing room, 36x28 feet.

The tools deemed almost indispensable for a first-class filing room are shown in the outline in correct position, and are as follows: Saw anvil, cross face hammer, round face hammer, nine inch straight edge, six foot straight edge, tension guage, brazing frame and pads, filing clamp, automatic saw sharpener, automatic swage, small portable forge.

In addition to the above, the following can be used to excellent advantage: Automatic side shaper, automatic saw stretcher, re-toother.

—The Rat Portage Lumber Company have just supplied the sash and doors for a new Baptist college at Brandon, Man. The order was secured in competition with the factories of Minneapolis and Winnipeg.

Canada Lumberman

MONTHLY AND WEEKLY EDITIONS

PUBLISHED BY

The C. H. Mortimer Publishing Company of Toronto, Limited

CONFEDERATION LIFE BUILDING, TORONTO

BRANCH OFFICE:
IMPERIAL BUILDING, MONTREAL

The LUMBERMAN Weekly Edition is published every Wednesday, and the Monthly Edition on the 1st day of every month.

TERMS OF SUBSCRIPTION:

One Copy, Weekly and Monthly, One Year, in advance..... $1.00
One Copy, Weekly and Monthly, Six Months, in advance..... .50
Foreign Subscriptions, $2.00 a Year.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in anyway affecting it. Even when we may not be able to agree with the writers, we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

SPRUCE TIMBER AND PULP.

The enhanced value of spruce timber lands has been clearly demonstrated by recent public sales held by the Governments of New Brunswick and Quebec. In New Brunswick $150 per mile is frequently obtained, while at the late Quebec sale a total of $400,000 was realized, the largest sum ever obtained by that Government on a like occasion. The competition at this latter sale would seem to foreshadow a rapid development of the lumber and pulp industries of the province. A timber berth on the Ouitchouaniche River, in the Lake St. John district, commanded $377 per mile, while the upset price was only $100. This same berth, if it had been placed on the market a few years ago, would probably not have realized $25 per acre, for until recently the highest figure reached was in the neighborhood of $75. Mr. R. Lemieux, of Pembroke, purchased 1,150 miles. He is understood to be acting for an American syndicate which has in view the development on an extensive scale of the spruce thereon.

There has been a wonderful expansion of the pulp industry in the Lake St. John district, in Quebec, within recent years. The immense mills at Chicoutimi promise to be outrivaled by projects about to be commenced, and we may expect that the value of spruce limits will continue to enhance for some time to come.

It is a question how far the market will be able to absorb the product of the many new pulp mills now projected, and for this reason capitalists should be most careful in the selection of sites, as, of course, the mills most favorably situated will meet with the greatest measure of success. It is not unlikely that the price of pulp will decline in the near future; hence also the necessity of giving careful consideration to the adoption of such methods as will cheapen the cost of production.

A report has been current that the large mills of the Sault Ste. Marie Pulp and Paper Company have lately been closed down on account of an insufficient demand. These reports, we are officially advised, have been without foundation in fact, the cessation of operations being caused by necessary dredging at the intake of the canal, which interfered with the operation of the mill.

THE CANADIAN TIMBER POLICY.

The caption of this article might be regarded as inappropriate, for it is well known that most of the timber lands of the Dominion are owned and controlled by the Provincial Governments; yet the tendency of the regulations that are being made from time to time by the different provinces are so in accord one with the other, that a policy common to the entire Dominion may eventually be looked for. Several steps in this direction have been taken within the past two months.

The Dominion Government has decided to apply the policy of home manufacture to the pine and other timber on Indian reserves and Indian lands. Hitherto timber cut on Indian lands was not subject to the export regulations and could be shipped to the United States without restriction. The result of the Ontario law requiring timber to be manufactured within the province has been the removal of several saw mills from Michigan to Ontario. The application of a like law to Indian reserve lands will cause the removal of other mills to Ontario, all of which is in the direction of benefitting the Canadian lumber industry.

The Legislature of British Columbia has followed the example of Ontario and Quebec in restricting the exportation of timber, an amendment to the Land Act designed to accomplish this object having been passed at the last session. Some of the loggers of British Columbia felt that the legislation was a hardship to them, and found that they were unable to dispose of their logs cut for United States mills at a reasonable profit. They pointed out that large expense had been incurred in some cases in opening up roads, etc., to enable the timber to be got out, and that due notice should have been given them of the proposed law before it became effective. Representations to this end were made to the Commissioner of Lands and Works, and it is understood that arrangements have been made which will protect the loggers from financial loss.

This legislation is generally approved by the public and lumbermen of British Columbia, and if it should result, as it probably will, in bettering the position of the lumbermen of the Pacific coast province, it is to be very strongly commended. Up to the present time, we understand, no great quantity of timber has been exported from British Columbia to the United States. The principal export has been in cedar, and there are two features of that trade which make the new law very desirable; first, that first-class cedar is becoming scarce, and secondly, that cedar shingles and lumber manufactured on the Sound have been shipped into the Canadian North-West free of duty, competing against the Canadian product, while the Canadian manufacturers have been kept out of the United States market by a duty.

In late years cedar in Washington has also become scarce, and the Washington mills had commenced to look to British Columbia for their future supply. Two or three firms had acquired licenses and put in camps to get out cedar logs. It might be pointed out that logging operations have been conducted on a much more extensive scale in Washington than in British Columbia, many of the largest camps being run by log contractors who do not operate mills. Practically all the timbered lands in Washington are in the hands of private parties.

The conditions in British Columbia corresponded exactly with those existing in Ontario before the passing of the manufacturing clause—the timber was taken across the line to build up foreign industries. At Blaine, just across the boarder in Washington, three mills have recently been built, the source of supply for which was intended to be British Columbia. Other mills on points on Bellingham Bay, Washington, are in the same condition. The recent legislation will doubtless be a hardship to the owners of these mills. It will also prevent the removal of other Canadian mills to Washington, or at least will prevent mills from drawing their supply from British Columbia, and thus lessen the prospect of removal from the province.

One of the objects which the British Columbia Government had in view was to forestall a depletion of the timber supply. While the change may inconvenience certain mills, the effect should be beneficial to the British Columbia trade, as it will, before many years, have a tendency to increase the value of timber.

The Quebec Government has adopted a new schedule of Crown timber dues, one of the most important changes being in respect to the duty on pulp wood. A little more than one year ago the Government raised the stumpage dues on pulp wood from 40 cents to $1.90 per cord, providing at the same time for a rebate of $1.50 a cord upon all the pulp wood manufactured in the province, which was equivalent to an export tax of $1.50 per cord. By the new order the stumpage tax is reduced to 65 cents per cord, a rebate of 25 cents per cord being allowed on all pulp wood manufactured at home. It is further provided, however, that a cord shall be considered as equal to 600 feet board measure, whereas heretofore 1,000 feet board measure had been regarded as a cord. While the new regulation would seem to be much more favorable to the exporter of wood than the previous one, it may be a slight advantage to Canadians to be relieved of placing such a high stumpage fee into the hands of the Government until the rebate is made.

The above amendments to the timber laws of Canada indicate that the trend of those in

charge of timber lands is to frame a policy which will result in bringing the utmost benefit to Canada from the development of her timber rcsources. In the past our timber policy has been too lenient, and the true benefit of our great inheritage of forest wealth has not been obtained.

EDITORIAL NOTES.

Beech lumber, not generally considered of great use, has been selling more liberally of late. There is no reason why it should not command a more prominent position among the hardwoods of Canada, and as users become more accustomed to this wood, it will doubtless meet with a greater demand and bring correspondingly higher prices.

The driving of hardwood logs is something which has heretofore been considered as impracticable, but it is learned that last year some Maine lumbermen made the experiment of driving hardwood logs with a loss of 10 per cent. This spring 600,000 feet of logs have been driven, and the loss has been not more than from soft wood drives. This result was accomplished by cutting the logs last summer and allowing them to season, in which case they do not sink. The demonstration of the fact that hardwood logs can be driven is of much interest to the trade, and no doubt the experiment will be tried by other lumbermen.

A most successful meeting of the National Hardwood Lumber Association of the United States was held in Chicago last month. The reports submitted showed that the work of the Inspection Bureau had been most useful, while at the same time proving the great difference in the grading of the different mills under ordinary circumstances. Within the last six months over 7,000,000 feet of hardwoods were inspected by Association inspectors. Some changes were made at the meeting in the inspection rules. The percentage of cuttings in common oak was reduced to two-thirds, and bright sap was made no defect in the grade of first and second plain sawed up to one-half the width of the board on one side. The lumber surveyor, Mr. M. M. Wall, of the Buffalo Hardwood Lumber Company, is anxious that the rules of this Association should be adopted by the hardwood men of Canada, and that when shipping to the United States they should have the lumber inspected by Association inspectors.

The movement to provide travelling libraries for lumber camps is making some progress. The lumber firms which have been provided with libraries have either set apart a room in the camp or built a small apartment in which the men may read and write. The railway companies have given tangible expression of their sympathy with the movement, and McGill University, Montreal, has promised a useful donation of books. The demand for libraries is stated by the Minister of Education to be greater than the supply, and it is hoped, therefore, that the cause will receive the hearty support of the public in the direction of contributions of books and money. The employing lumbermen are co-operating in the work in a commendable manner, and it remains for the Government to make a grant for the purpose proportionate with the extent of education and benefit which is likely to result. So far the movement has been confined to Ontario. The necessity for such libraries exists alike in every province of the Dominion.

In view of the depression which prevails in the timber trade throughout the United Kingdom, it is surprising that the higher grades of lumber have suffered very little in price. It seems that it is becoming more difficult each year to secure timber which will make first quality lumber of large dimensions. This applies to Canada as well as the north of Europe. Some complaint has been made by British timber journals as to the system of grading now employed by the Ottawa valley pine manufacturers. We doubt whether this dissatisfaction is shared by British importers, as the changes made have been very slight and brought about by the changed conditions governing the getting out of timber. As timber becomes less plentiful, the grading of the lumber will be altered, and a board which ten years ago was classed as second quality may now be passed as first quality. It is somewhat singular that the grades vary in relation to the demand; hence it is that so much is heard this season from Great Britain regarding inferior lumber. When the market is strong and everybody is anxious to buy lumber, the grades are not scrutinized to the same extent.

A PRESCOTT DOUBLE CUTTING MILL.

The lumber trade will be interested in learning of the success of the experiment of operating a double toothed saw on an old type of band mill. As stated in this journal some time ago, the Rat Portage Lumber Company have changed one of their Prescott band mills into a double cutter. Concerning the results accomplished Mr. Charles E. Hamilton, in writing to "The Lumberman," says: "I must say we are surprised with the results, which have been far above our expectations, both as to quantity and quality of lumber. It has turned out as we expected, a double saw cannot be operated without an adjustable guide both bottom and top, which the telescopic mill has not got. The company intend operating the mill at Norman on the telescopic. They have had some trouble, but expect to do better after they get attachments for an adjustable guide. At Rat Portage we are cutting from 65,000 to 75,000 feet of logs in ten hours, and the double cutting mill is working well. I think mill owners would do well to have Mr. J. F. McRae fit up their mills with his devices for double saws."

The annual report of the Lake St. John Railway, shows that in 1900 1,037 cars of sawn lumber and 3,112 cars of pulp and paper were hauled by the road.

Four of the largest lumber plants on the Saginaw river are about to be consolidated. They include those of W.B. Mershon & Company, William Schuette & Company, S. L. Eastman & Company, of Saginaw, and the Eddy-Sheldon Company, of Bay City. The capital of the new concern will be $1,000,000. Only one lumber yard will be operated, located at Bay City, where there is dock room for 5,000,000 feet and storage capacity for 40,000,000 feet.

CUSTOMS OF THE BRITISH TRADE.

Edit r CANADA LUMBERMAN:

There seems to be an impression existing in Canada that England is behind the times, and while this is certainly true as regards machinery, it is altogether wrong if applied to business methods. If we were better acquainted with those business methods we would get more advantage from our superior machinery. I speak of all kinds of wooden goods, goods which Canada of all countries should be in a position to produce. Our advantage in this line does not lay any more in cheap timber than it does in our machinery and power. Birch is a drug in the English market to-day. It can be bought for $22.00 per thousand, and the price quoted here is very little lower. On the other hand, scarcely any machine turning is done there, and when we consider the fact that nearly two million pounds worth of small turnings are imported yearly, we can have some idea of the extent of the market.

Manufacturers are willing and anxious to buy from Canada, providing we will make what they want and know what price we can make the goods for. One manufacturer remarked that he found a man in Canada who made what he wanted but did not know what price to ask, but wanted to know what price was going in England. "I quoted him a price," said the manufacturer, "but he wanted to know if I could not pay a little more. I thought he did not know his business so I dropped him."

And just here let me remark that there are many prices going in England. The commission agent pays a small price and often is not a safe man to deal with. The wholesale man is better; but the consumer is the one to reach when possible. He is a very conservative man generally, but when once you have him he will stay by you as long as you treat him right.

Another thing the Canadian exporter will have to impress on his mind. Englishmen want just the pattern they are using. They dont want any other. One man uses one pattern; it may be his father used it before him, but he will use no other. Good goods bring a good price in that market as well as any other, and when your man finds that you make a good article he will stay with you.

There are two principal ways to do business: First, by sending a man to open up a market; secondly, by employing an agent. The first plan is a good one if you are a large exporter, for it is very costly and you will have to work a long time before you will be able to secure a market, and you will have to spend a lot of money. The Diamond Lubricating Company and the Anderson Furniture Company have taken this plan, and judging by their trade there, they have made a success of it. They put out travellers who sell their goods.

The second plan is a good one for small exporters, and for anyone if you can secure the right agent. A young and pushing man will be better than an older and more conservative concern. From five to ten per cent. is paid and a good man will give you many good things which he may find in your line, but do not engage any agent until you are sure of him, for there are many who are floating about looking out for new men whom they make a business of fleecing.

Yours truly,

W. E. D.

Toronto, June 28th, 1901.

EXCELSIOR MACHINES.

The Elmira Agricultural Works Company, of Elmira, Ont., have placed on the market a machine for the manufacture of excelsior packing. The process of manufacture is as follows: The timber is cut into bolts of 18 inches in length. These pieces are then fastened into the frame of the machine, and are operated on by a set of knives which cut longitudinally at a depth of about 1-32 inch and at 1-32 to 1-16 apart. Following this operation comes a single edge planing knife, which takes a shaving off the entire surface, the result being dozens of strips of wood of clean straight edges, but twirled into all kinds of fantastical shapes. The material has been found very valuable and useful for packing purposes, and is in increasing demand.

OBITUARY.

A. F. E. PHILLIPS.

In the death of A. F. E. Philips, which took place in Winnipeg last month from appendicitis, the lumber trade has lost one of its brightest members, and one who had before him a promising career. Mr. Philips was only thirty-one

THE LATE A. F. E. PHILLIPS.

years of age, and for the past nine years had been general agent in Manitoba and the North-West Territories for the Pacific Coast Lumber Company and the Brunette Saw Mill Company, of New Westminster, B.C. Previous to that time he was engaged with the Minnesota & Ontario Lumber Company, of Norman.

Mr. Philips was a most successful representative of the Pacific Coast firms, and at the time of his death had worked up a considerable trade. He was one of the smartest travelling lumber salesmen in the North-West, and was well liked by everybody. He always took a deep interest in the welfare of the Western Retail Lumbermen's Association, as well as all movements looking to the improvement of the lumber trade in general. He was an enthusiastic member of the Winnipeg branch of the Hoo-Hoo Order, which was formed about two years ago.

EDWARD SINCLAIR.

Edward Sinclair, the well known Miramichi lumberman, died at his home in Bridgetown, N.

THE LATE EDWARD SINCLAIR.

S., on May 30th, after an illness of ten weeks. Mr. Sinclair was one of the largest lumber merchants on the north shore. Born at Douglastown, N.B., in 1842, he received his early business training in the office of Gilmour, Rankin & Company, after which he entered the employ of Hon. Peter Mitchell, at that time a lumber merchant and ship-builder. Subsequently he started in business for himself. Although meeting with many reverses by the loss of vessels which he built, he finally applied himself exclusively to the lumber business and succeeded, it is said, in laying by a fair share of this world's goods. He shipped largely to the United States and Great Britain.

Mr. Sinclair gave generously and without ostentation to deserving objects. His generosity may be illustrated by citing one of his acts, which was to give the sum of $1,000 for the professional education of a young man who wished to become a physician but was without means to continue his studies.

As a business man, Mr. Sinclair was shrewd and far-sighted. At the time of his death he owned probably 200 miles of Crown timber limits, and was the owner in fee simple of Beaubier's Island, about a mile long and half a mile wide, in the Miramichi river, near his home. This Island is covered with a fine growth of spruce timber. His death is a distinct loss to the social and industrial world.

POINTS IN MAKING SLACK COOPERAGE STOCK.

A correspondent of the Barrel and Box asks the following questions :

1. How many staves will 1,000 ft. of average elm logs make ?

2. What per cent. of No. 1 staves is the average ?

3. When logs cost $8.00 a 1,000 how much ought No. 1 and No. 2 staves sell at ?

4. What is the value of 1,000 ft. of logs when bolts cost $2.00 a cord ?

5. If logs cost $6.00 a 1,000 how much are bolts worth ?

6. How many staves will a cord of average bolts make.

7. What is the average cost of producing 1,000 staves exclusive of the cost of timber ?

8. How many hoops will 1,000 feet of average logs make ?

Answers to the above questions are given as follows :

As to the first question, there is no accepted average on the number of staves in 1,000 ft. of logs. We figured it out in February to be about 2,500 staves, but not all, or for that matter none, seem to concur in the figures. There seems to be so much difference in timber that it is difficult to strike an average. Some figures in the writer's note book show productions as high as 3,200 and 3,500 from gum timber, but there is a tune to these figures, and that is in the fact that the logs were measured by the Doyle rule up to 28 in. and above that size with the Scribner rule—and then this was gum, and it is elm we are talking about. From the best information at hand it would seem that in the North, and with elm timber measured as they measure it there, one will be doing well to get 2,500 staves on an average. That is what we call mill-run staves, dead culls out.

In the second question, on the average per cent. of No. 1 staves, there is even a more wide variation than in the question of production, for the quality of timber affects the grade even more than it does the quantity of merchantable staves. Referring again to the notebook of the writer an instance comes to view of 75 per cent. of No. 1 stock, and 3,250 staves from 1,000 ft. of logs, but this is qualified by the remark that it was good elm timber. In face of this, and considering the stock of timber available this season, it is our opinion that in the North there will not be a general average of more than about 40 per cent. of No. 1 if the staves are graded as closely as they should be. In the south the average will be considerably higher if proper pains are taken in the process of manufacturing and caring for stock.

To the third question, what ought staves to sell at when logs cost $28,00 a 1,000, we feel like answering by asking who in the North has been getting logs at $8.00 this year ? That same tell-tale note book says that the first of the year Michigan manufacturers were having to pay $12.-50 for logs. Some logs, not very good, were reported at $9.00, but those who were getting stock at this price said they could afford to pay more for good logs, and on down in Ohio good hoop logs were worth $15.00 the first of the year. Now, the way we are going to answer that question is by saying that if logs only cost $8.00 staves would be worth more than some seem to be quoting them at to-day, and at the prices we know logs have been bought at this year, we know that a man cannot sell for any such figure as he could if logs were worth only $8.00.

Questions 4 and 5 come very near answering each other, and the writer is a little suspicious that "North Star" wrote them that way on purpose. We are going to "beg" this question, however, and let some mill man answer it. We could go to work and figure some sort of an average between comparisons of foot measure to cords and in this we find a variation from near three cords to the 1,000 ft. of lumber to some claims of less than two cords. The point in this which puzzles us is the relation of value between the same quantity of wood in the bolt and in the log. It occurs to us that a certain amount can be obtained in bolts from material which will not make logs, and that a difference here at times may affect the price at which bolts can be bought as compared to logs. Will some mill man give us a little light on the subject. Yes, and who is it up north who is getting logs for $6.00? Is not that a sort of joke ?

In answering the sixth question, on the number of staves which a cord of bolts will produce, we figured it an average of 1,000 at the same time and on the same basis which was taken for the 2,500 for 1,000 ft. of logs. Neither has this been accepted as a general average, for there are all sorts of difference in cords and their production. Some people have bolting saws and can get more stock than those who split their blocks up; some do not pile stock up into cords, but measure across the ends of the blocks inside of the bark and count a cord by tape measure—usually 25 ft. for a cord. All this makes so many variations that there is no such thing as striking a general average that will be of value to work from.

As to the average cost of producing 1,000 staves exclusive of the cost of timber, it is—well, it is more than many a man thinks it is, or else some in the trade do not care for the loss of money, that we have been hearing about. On the point of labor alone, we find some who say that it does not cost them any more than it did last year, but quite a lot more say that the labor cost is 20 to 25 per cent. higher than last year. Labor cost alone, though, does not tell the tale of cost in manufacturing staves, for where is that high insurance rate that we have all been talking about? Where is your own time and worry as manager of the business ? Where are you to get interest on the money invested in the plant and business, and where are a whole lot of things of this character to come from if they are not added to the cost of manufacture ? We can not sit here in the office and tell any man what it costs him to make his stock, nor can we strike an average, for individual cases vary too much, but we can point out that added to all the expenses enumerated here, which are sometimes overlooked, there is this year an additional expense in the work of selling stock. It costs lots of money to go to visit the trade, and this year there is to be a lot of that done, for the trade is not seeking stock as it has in years past, so that you can sit in your office and let the stock sell itself. You have to go on the road, or pay some other man to sell your stock right at this time, and all this costs money—and this is legitimately a part of your manufacturing cost.

As to the number of hoops 1,000 ft. of logs will make on an average, we can only get at it approximately. Some of the leading manufacturers say that there is a difference of about 1,000 between sawing and cutting, and that in cutting from flitches about 4,000 is an average, while 3,000 is a very good average when sawing them from the same stock. This does not give us any light on cutting by the rotary process, nor does it give a true basis for hoop calculations. In making hoops some simply buy lumber for the work, and many of those who work the log into lumber themselves do not put all the log into hoop flitches, being guided largely by the grade of the material and by what else there is a market for that they can use a part of the log. Also, this average figure means hoops of different lengths, so that in figuring you have to take in to consideration the lower price of the many short hoops you are forced to make.

Weekly Lumberman, published every Wednesday. Contains reliable and up-to-date market conditions and tendencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canaian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

Lumberman, Monthly. A 20-page journal, discussing fully and impartially subjects pertinent to the lumber and wood-working industries. Contains interviews with prominent members of the trade, and character sketches and portraits of leading lumbermen Its special articles on technical and mechanical subjects areespecially valuable to saw mill and planing mill men and manufacturers of lumber products.

THE KNIGHT BROTHERS CO.,
Burks Falls, Ont.

WANTED.

EXPERIENCED MAN WITH CAPITAL TO take junior partnership and assist in management of large building and retail lumber business, small city Splendid chance for young practical man. Box 99. LUMBERMAN.

CURRENT TRADE CONDITIONS.

ONTARIO.

The lumber transactions of the past week have borne evidences of summer quietude. Buying has been done by consumers only where the stock was urgently needed. Yet in the face of unfavorable conditions, the market for pine is keeping up in a remarkable way. While lower prices are talked of by dealers, and might reasonably be expected at this season of the year, manufacturers refuse to yield to any demand in this direction. A few of the small manufacturers are no doubt offering stock at prices under the spring quotations, but this is the exception rather than the rule, and their action is disregarded by the largest manufacturers who make and rule the market. One of the factors of strength is that many American buyers are in Ontario ready to close contracts for large quantities of lumber. The fact is that the prices asked by Canadian pine manufacturers are lower than is quoted at the mills in the Northern States, and consequently buyers have turned their attention to this side. In Toronto trade is rather quiet and prices a little irregular. A dealer who recently gave a quotation of $18 for a quantity of 2x12 was advised by the prospective customer that he was $1.50 higher than some of his competitors. The average price is from $17 to $17.50. The strike of carpenters in Ottawa has caused a temporary falling off in the demand for lumber and in supplies generally.

It is not possible to give a favorable report of the hardwood market. The demand continues dull, with stocks at many of the mills comparatively heavy. Maple 1 to 2 inch in thickness is in fair demand, but heavier stocks, such as 3 and 4 inch, are little enquired for. Basswood and birch are firm and moving moderately, while soft elm is meeting with slow sale. It can hardly be expected that the demand will improve during July and August, but a better demand is expected in the fall. In the meantime there is the danger that manufacturers will be compelled to realize.

Lath prices are quite irregular. While some mills are asking $2.50 for No. 1 white pine lath, purchases have been made as low as $2. The tendency of the market, however, is upwards, in sympathy with the higher prices that are being asked in the United States.

QUEBEC AND NEW BRUNSWICK.

There have been no fluctuations of consequence in the Quebec lumber market, our information being that prices are practically unchanged on square and waney timber, while spruce deals are slightly weaker. Some of the shippers are understood to be sending timber to the British market on consignment. The reports regarding New Brunswick cedar shingles are somewhat contradictory. While $3 is being named by certain manufacturers as the price of extras on Boston rate of freight, other manufacturers are willing to sell at $2.90. The weak holders, however, have no large quantity to offer, and the market may be said to be in good condition. A few of the log drives have been abandoned owing to low water in the streams, and the cut of spruce is likely to be curtailed as a result thereof.

UNITED STATES.

The general lumber market of the United States is strong, with white pine leading. Dry stock is taken as fast as offered, and in some instances the sales of the past week have been made at an advance over the late ruling quotations. White pine dimension is in short supply in the Lake Superior district, and a meeting of the price list committee of the Mississippi and Wisconsin Valley Associations will be held early this month for the purpose of revising the prices of dimension and heavy timber. The manufacturers of the Wisconsin valley are already asking an advance of fifty cents a thousand on dimensions and twenty-five cents on large timber. In the Saginaw valley trade is good and prices firm. In our Bay City and Saginaw list the price of pine common has been marked up $2 per thousand, as the stocks are badly broken and receipts not sufficient to meet the demand. Norway lumber is particularly strong. At Buffalo Norway is scarcer than white pine, and the supply at the mills is understood to be light. It is probable that the season will be an exceptionally good one for Norway pine. The higher grades of pine are scarce in the Buffalo and Tonawanda markets, but the demand from the east has fallen off slightly; in fact, the eastern trade has been spasmodic all season. The spruce market is less active than it has been, but the condition of the supply is not such as is likely to cause any slump. Of the hardwoods basswood and ash are probably in most demand, the latter having come into prominence of late. Elm and thick maple sell fairly well, but there is no snap to the market. An advance in the price of lath is talked of. The price at the mill is from $2.50 to $2.75 for No. 1 white pine, and $1.75 for No. 2. In Chicago No. 1 mixed lath is quoted at $2.75 and No. 2 at $2.25. In Philadelphia lath are particularly scarce, three cargoes of New Brunswick manufacture which arrived there recently being soon disposed of. The supply of white pine shingles is so small that hemlock and other substitutes are being used.

GREAT BRITAIN.

The outlook for the timber trade in Great Britain has not improved during the past fortnight. While the consumption by some branches has increased, there has been no recovery of prices, the recent sales representing new figures for this season. Importers who contracted at the higher prices ruling in the early spring are holding their stock, and as no buying of cargoes to arrive is being done, business is practically at a stand still. The prices of Canadian deals and timber are holding up better than those of the north of Europe production. The price of second quality Quebec spruce landed in the docks at London is £10 per standards, whilst third quality is selling at £9 5s. Cargoes of St. John spruce, with an ordinary specification, say 10 per cent. of 3x11, can be bought at £6 6s c.i.f. Liverpool, while twelve months ago similar cargoes were sold at £7 15s. The market for square and waney timber is stronger than for deals and boards, although by no means buoyant. We believe it will be found in the interest of exporters on this side to curtail shipments as much as possible, and give the market an opportunity to recover.

STOCKS AND PRICES.

Thomas Mackie, of Pembroke, Ont., has recently purchased fine timber limits in the vicinity of Saskatchewan, N.W.T.

Sales of hemlock piece stuff are being made in Chicago around $9.25, although a few transactions are reported at slightly lower figures.

The steamer Lycia, which is loading a general cargo at Montreal for Bristol, Eng., took on 250 standards of deals at Three Rivers, Que.

Moore & MacDonald, of Blind River, Ont., have all their logs boomed. The mill at John's Island will cut 4,000,000 feet, and a like quantity will be cut at Cutler.

A recent despatch from Whitefish River states that of the 240,000 logs cut on berth 82, the greater quantity are through the slides. In all about 35,000,000 feet of pine

logs will come out of the Whitefish River and tributaries this season.

In New York city $58 to $62 is being asked for quartered oak, $36 to $40 for plain oak, and $37 to $41 for ash. There is an improvement in that city in the demand for hemlock, at the base price of $14.50. In Tonawanda the base price is $13.50.

Owing to a flood on the St. Francis river, a large boom of logs belonging to the Royal Paper Mills Company, of East Angus, Que., was carried over the dam. It is estimated that 12,000,000 feet got away, but most of the logs have been secured at Pierreville, where the company have arranged to have them sawn.

The John O'Brien Lumber Company, of Ashland, Wis., last week sold 6,000,000 feet of Noway pine to Cleveland parties for a price in the neighborhood of $72,000, and 1,000,000 feet of white pine to a North Tonawanda concern at $15 a thousand. W. H. Gilbert sold 1,000,000 feet of No. 5 boards to Buffalo parties at $5 a thousand, and 700,000 feet of 4 boards at $10.50.

Concerning the shingle market at Buffalo the American Lumberman says: "Old dealers are often without any stock of account, and are not looking for a supply, for they do not know what to do. They say that the price of red cedars has gone up so that they do not see how consumers will buy them, and still there is not much yet to take their place. This market has of late come to depend on them more, and now, when it appears that something else is needed to substitute for them, nobody knows which way to turn. It is not thought that cypress could be sold cheap enough and nobody wants hemlock. Still if pine shingles do not come in faster something will have to be done."

Following is a comparative statement for three years of the timber, etc., measured and culled at the port of Quebec up to July 2nd, as reported by the Supervisor of Cullers:

	Cu. ft. 1899	Cu. ft. 1 00	Cu. ft. 1901
Waney white pine	872,132	506,999	348,640
White pine	263,971	185,173	149,192
Red pine	87,429	7,014	4,356
Oak	334,661	266,268	203,278
Elm	332,680	357,197	416,028
Ash	43,533	60,240	86,610
Basswood			332
Butternut	60	92	462
Tamarac	415	71	22
Birch and maple	229,867	287,119	295,641

CANDIAN LUMBER SHIPMENTS.

The following shipment of lumber, etc., from Canadian ports are reported since last issue:

From Pictou, N.S.: For Glasson Docks, Eng., 15,500 pcs. spruce deals, etc., by W. M. Mackay.

From Parrsboro, N. S.: Str. Maritime, for Manchester, Eng., 2,566,162 ft. spruce deals, ends, etc., value $25,218, by M. L. Tucker.

From Sheet Harbor, N.S.: Barque Hermanoes, for Ayr, Scotland, 420,000 ft. deals, scantlings and ends, value $4,266, by Sheet Harbor Lumber Co.

From Vancouver, B.C.: Barque Palatina, for Taku, China, 882,225 ft. rough fir, value $19,240, by British Columbia Mills, Timber & Trading Co.

From Hillsboro, N.B.: Barque Carry L. Smith, for Birkenhead, Eng., 534,212 ft. spruce deals, 84,722 ft. spruce scantlings, 31,659 ft. spruce ends, 14,572 ft. spruce boards, value $5,592, by J. Nelson Smith.

From Yarmouth, N. S.: Schr. Prohibition, for Norwalk, U. S., lumber, lath, etc., value $1,252, by Dickie & McGrath. Barque Lillian, for Buenos Ayres, lumber, value $5,256, by Dickie & McGrath. Barque Harry, for Barbadoes, lumber, value $818, by H. & N. B. Lewis. Barque Vallord, for Bristol, Eng., deals and palings, value $7,772, by Dickie & McGrath.

From Chatham, N. B.: Barque Ragwa, for Plymouth, Eng., 459,934 ft. lumber, by F. E. Neale. Str. Eberingham, for London, Eng., 3,458, 696 ft. deals, etc., by J. B. Snowball & Co. Barque Gumo, for London, 703,760 ft. lumber, by F. E. Neale. Barque Lennok, for England, 450,385 ft. lumber, by Fred Dyke. Str. Probus, for Rochefort, France, 1,146,000 ft. lumber, by J. B. Snowball & Co. Str. Londonderry, for Glasgow, 2,070,563 ft. lumber, by F. E. Neale.

From Sackville, N.B.: Barque Flora, for Runcorn, Eng., 408,019 ft. deals, ends, etc., value $3,484, by George McKean. Barque Agat, for Runcorn, Eng., 393,113 ft. deals and battens, 143,484 ft. scantling, 24.475 ft. ends, value $4,179, by Geo. McKean. Barque Gamma, for Cardiff, Eng., 414,479 ft. deals, 25,162 ft. battens, 64,638 ft. scantling, 3,520 ft. boards, 18,260 ft. end, value $4,000, by M. Woods & Sons. Str. Dara, for Manchester, Eng., 1,158,202 ft. deals, 240,280 ft. scantling, 48,347 ft. ends, 60,238 ft. boards, value $16,000, by P. G. Mahoney, Barque Inga, for Preston, Eng., 375,298 ft. deals and battens, 39,098 ft. scantling, 9,856 ft. deal ends, value $3,700, by George McKean.

From Montreal, Que.: Str. Lorne, for Cardiff, Wales, 525 stds. deals, 2,970 cub. ft. timber, by Dobell, Beckett & Co. Str. Fremona, for London, Eng., 7 stds. boards, by Gillies Bros; 150 pcs. timber, by Dobell, Beckett & Co. Str. Samatian, for Glasgow, 62 stds. deals, etc., by D. Cream & Co.; 106 pcs. timber, by W. & J. SHIPPING MATTERS.

Freight rates on lumber by canal and lake are very strong. Some barges are getting $2 from the Georgian Bay to Buffalo, while the regular rate from Green Bay is $1.87½, and from Duluth $2.50. The prevailing rate from North Tonawanda to New York is $1.75, and to Albany $1.35.

Freight rates on lumber from British Columbia points rule as follows: To Sydney, 42s 6d; Melbourne to Adelaide, 50s; Port Pirie, 48s 9d; Fremantle, 65s; Shanghai, 50s; Kiao-Chau, 50s; Taku, 55s; Vladivostock, 50s; w.c. South Africa, 52s 6d to 55s; South Africa, 65s to 67s 6d; U.K. or Continent, 75s.

The Timber Trades Journal reports that very few fixtures have been concluded from Canada except re-arrangements on previous contracts. The following are reported: Cape Hopewell to W. C. B., 1,200 stds, 41s; River du Loup to London, 1,200 stds, 45s, July; St. John to U. K., 1,200 stds, 40s, July-August; "Ashmore," St. Lawrence to U. K., 46s 3d, August; two boats, Quebec or Montreal to London, about 1,200 stds each, 46s 3d, re-lets.

The following charters are reported: Str. Dumarec, Montreal to Sharpness, deals, 55s; str. Raithwaite, St. John, N. B., to w.c. England, deals, 41s 3d, July; str. 2024 tons, St. John, N.B., to w.c. England, deals, 40s; barque 845 tons, St. John, N.B., to Santa Cruise, deals, 53s 9d; schr. 252 tons, St. Thomas, Que., to the U.K., deals, £675; schr. John B. Thomas, St. John, N.B., to Bristol Channel, deals, 45s; barque F. D. Lovitt, St. John, N.B., to Irish port, deals, 46s 3d; barque Loreto, St. John, N.B., to Buenos Ayres, lumber, $9.50; ships, Gregorio Bradie and Orient, St. John, N.B., to Melbourne, Aus., deals, 75s and 77s 6d respectively.

THE BOSTON MARKET.

The spruce lumber position is still very firm, with logs generally scarce. A good many mills are stopped for want of logs, and some must remain so for some time, or till some rise of water brings down the logs. Meantime, the market shows little change, with prices firm. The demand is in the midst of the hot weather quiet: Ten and 12-inch dimensions, $18 to $19.50; 9 in. and under, $17 to $18; 10 and 12 in. random lengths, 10 ft. and up, $17.50 to $18.50; 2x3, 2x4, 2x5, 2x6, 2x7 and 3x4, 10 ft. and up, $15 to $16; all other randoms, 9 in. and under, 10 ft. and up, $15.50 to $17; 5 in. and up, merchantable boards, $15 to $17; matched boards, $17 to $18; out spruce boards, $12.50; bundle furring, $14.

Hemlock remains scarce and, firmwith very little change: Eastern boards, $15 to $16; random, $13 to $14.

Western pine shippers still talk of high prices, and say that the position is very strong. Here the market is quiet, with prices firm: Uppers, 1 in., $58 to $62; 1¾ to 2 in., $63 to $64; 3 and 4 in., $68 to $72; selects, 1 to 4 in., $52 to $64; fine common, 1 to 3 in. $45 to $60; sheathings, $38 to $54; barn boards, $25 to 30; coffin boards, $23 to $25.

Hardwoods continue in moderate request. House finishing is not active, and the call for finishing hardwoods is limited. Still prices are well held: Quartered oak, $65 to $75; fancy, $85 to $90; plain oak, $35 to $45; ash, $38 to $45; cherry, $90 to $130; maple, $30 to $40.

Shingles are a little firmer. The sellers of cheap shingles are pretty well sold out, and the trade is in the hands of better holders. Still the demand is rather limited: Extra, $2.85 to $2.90; clear, $2.60 to $2.65; second clear, $2 to $2.25; sap, $2 to $2.25; extra No. 1, $1.60 to $1.75; British Columbia, 16 in., five butts to 2 ins., $3.15 to $3.35.

Clapboards continue firm, because scarce. The demand is small, but buyers have to pay full prices: Extra spruce, $30 to $32; clear, $28 to $30; second clear, $26 to $28; extra No. 1, $18 to $20; pine, extra, $36 to $38; clear, $36 to $37; second clear, $28 to $30.

Laths are in steady moderate demand, with prices unchanged; 1⅝ inch, $2.85 to $2.90; 1½ inch, $2.70 to $2.85.

FIRES.

The lumber yard of William Rutherford & Company at St. Cunegonde, a suburb of Montreal, was partially destroyed by fire on June 30th. Nearly a million feet of lumber was burned.

The planing mill and sash and door factory of McCredie & Hodgins at Shawville, Que., together with a stock of lumber, were destroyed by fire last week. It is understood that there is no insurance.

THE NEWS

—A new saw mill at Moyie, B.C., isnearing completion.

—Bowtinheianir & Son are opening a lumber yard at Red Deer, N.W.T.

—It is stated that Joseph Chew purposes establishing a saw mill at Vancouver, B.C.

—C. A. Larkin, wholesale lumbsr dealer, is now located in new offices in the Confederation Life Building, Toronto.

—P. McGrath, of Winnipeg, has accepted the position of night sawyer with the Keewatin Lumber Company, of Keewatin, Ont.

—Alex. Cripps, of Crewson's Corners, Ont., has sold his saw mill to James Brown, of Acton. Mr. Brown is moving the mill to Acton.

—A subscriber of THE LUMBERMAN wishes to find a market for inch beech, from 7 to 16 feet long, 4 inches and up wide, cut during the winter of 1900.

—T. & R. Ritchie have recently completed their new saw mill at Aylmer, Que., and have secured a contract for sawing from the Hull Lumber Company.

—Walter & Humberstone have made extensive improvements to their saw mill at Strathcona, N.W.T., increasing the capacity to 40,000 feet per day.

—Thackray & Rawlins have purchased a site at Pembroke, Ont., on which they intend erecting a steam saw mill with a capacity of 15,000 feet per day.

—The Hastings Shingle Manufacturing Company, of Hastings, B.C., has been incorporated, with a capital stock of $600,000, to manufacture shingles, etc.

—It is the intention of Stevens, Hepner & Company, of Port Elgin, Ont., to erect a factory for the manufacture of broom handles and woodenware generally.

—George Gordon & Company have a splendid saw mill at Cache Bay, Ont., in which an average of 1,500 logs per day is cut. Alex. McCool, late of Pembroke, is superintendent of the mill.

—Incorporation has been granted to the Huron Lumber Company, capital $40,000, to manufacture lumber, shingles, etc. The directors include W. H. McCormick and C. F. Brennan, of Bay City, Mich.

—The annual meeting of the A. Gravel Lumber Company, of Etchemin, Que., was held in Quebec city last month, at which the board of directors was re-elected and the usual dividend declared.

—Davidson & Thackray, of Ottawa, are building a new saw mill at Bryson's Point, about two miles from the junction of the Coulonge with the Ottawa river. It will be 24x100 feet, and will saw dimension lumber and timber.

—At the recent Methodist conference in Toronto a resolution was passed favoring the establishment of reading rooms and travelling libaries in lumber camps, and expressing the hope that the scheme would be more fully adopted.

—The Rat Portage Lumber Company have purchased the saw mills and plant of Hughes & Long at Beaver Mills, Ont. It is the intention to enlarge the plant. The Rat Portage Company expect to cut 60,000,000 feet of lumber this season.

—The Department of Interior at Ottawa is asking for tenders up to July 22nd for a license to cut timber on Berth No. 905, situated in the district of Saskatchewan, to the northwest of Lake Winnipeg. The berth comprises an area of 50 square miles.

—The business of J. D. Shier at Bracebridge, Ont., has been transferred to a joint stock company, to be known as the J. D. Shier Lumber Company. The capital stock is $100,000, and the directors include J. D. Shier and W. H. Shier, of Bracebridge, and E. A. Begg, of Toronto.

—The Brunette Saw Mill Company, of New Westminster, B.C., is making preparations for the beginning of extensive logging operations in the district of Burnaby, north of the lake. The matter partly depends upon the obtaining of certain rights of way to the lake. It is said that at least 15,000,000, and perhaps even 20,000,000 feet of good timber can be cut in the part of Burnaby in which it is proposed to commence logging.

—The Logan Lumber Company is establishing a new lumber business at Fernie, B.C. The mill, now under construction, will have a capacity of 35,000 feet per day. Valuable timber limits have been acquired, and it is expected that a considerable trade will be done throughout the Territories and Manitoba.

—W. H. Higgins has completed his logging contract with the Chemainus Lumber and Mancfacturing Company, of Victoria, B.C., after an engagement of six years. Before leaving Chemainus, Mr. Higgins was presented by his employees with a purse containing over $1,000 as a mark of esteem. He is understood to be perfecting plans for timber operations along the northern coast of British Columbia.

PERSONAL.

Mr. Russell A. Alger, jr., of the Laurentide Pulp Company, of Grand Mere, Que., is at present on a tour of Europe.

Mr. Duncan Sinclair has been appointed representative in Winnipeg for the Pacific Coast Lumber Company and the Brunette Saw Mill Company, of New Westminster, B. C., as successor to the late A. F. E. Philips.

Another well-known member of the lumber trade has forsaken the ranks of bachelorhood, in the person of Mr. James Keenan, of the lumber firm of Keenan Bros., of Owen Sound, Ont. The wedding took place on June 7th, the bride being Miss Lulu Gutting.

Mr. James C. McNair, president of the Hastings Shingle Manufacturing Company, of Vancouver, B.C., accompanied by Mrs. McNair, is at present on a tour of the Eastern States and the eastern part of Canada. He expects to return to Vancouver about the end of July.

An interesting wedding was celebrated in the Hanover Anglican Church, London, England, on June 17th, the participants being Miss Muriel Dobell, daughter of Hon. R. R. Dobell, lumber merchant of Quebec, and Capt. Amyot Hull, of the Scots Fusiliers. Among the guests were Lord and Lady Aberdeen.

The employees of the Toronto branch of the Canadian Rubber Company presented their manager, Mr. Alex. McPherson, with a handsome silver service on the eve of his recent marriage. In acknowledging the courtesy Mr. McPherson spoke of the friendly relations existing between the employees and himself.

CASUALTIES.

Louis Cole was instantly killed in the saw mill of R. A. Howes, Otterville, Ont., by being struck by a slab from a saw.

Francois Montreuil, a workman employed in J. R. Booth's mill at Ottawa, fell off a log and was drowned on June 20th.

R. J. Tobin, a sawyer employed in Edmund Hall's saw mill at Sarnia, Ont., was so seriously injured in the mill recently as to necessitate the amputation of one leg.

While breaking a log jam on Hope Bay dump, near Lion's Head, Ont., Nicholas O'Hara, foreman of the job, was caught under the rush of logs and fatally injured. He was working for Charles Pedwell, of Lion's Head.

QUEBEC TIMBER DUES.

On June 1 a new set of regulations relating to woods and forests was adopted by the Executive Council of Quebec province, and promulgated by order-in-council. One change is in regard to the dues on pulp wood, which are largely reduced. It is provided :

All licenses to cut timber are subject to an annual ground rent of three dollars per square mile or fraction thereof; also, to an annual fire tax, the amount of which is fixed from time to time by the commissioner. These licenses run from the 1st May to the 30th April following, and no claim for over charge of ground rent and fire tax in the extent of the limits can be entertained after the licenses have issued.

All licenses expire on the 30th April, after being issued, but the licentiate who conforms to the existing regulations has, until the 1st September following, the right of renewal of same. Any infraction of the law or regulations forfeits the said right, but the commissioner may consent to the renewal of the license, on payment of the ground rent, and such penalties as he may see fit to impose.

All wood goods cut in virtue of a license are subject to the following charges :

Square and waney timber, cubic foot :		
Oak and walnut	4	cents
Other descriptions	2	"
Saw logs, boom and dimension timber per 1,000 feet, B. M., of :		
Spruce, hemlock, balsam, cypress, cedar, w. birch and poplar	65	"
Red pine	80	"
White pine and other varieties	$1.30	"
Cordwood (firewood), per cord of 128 cubic feet :		
Hardwood	20	"
Softwood	10	"
Pulp wood per cord of 128 cubic feet, with a reduction of 25 cents per cord on timber manufactured into paper pulp in the Dominion of Canada	65	"
Rails not exceeding 12 feet in length per 100 pieces :		
Cedar rails	30	"
Rails of other varieties of timber	15	"
Pickets per 100 pieces :		
Cedar pickets	15	"
Pickets of other varieties of timber	10	,"
Cedar or pine shingles per mille :		
Short	10	"
Long	15	"
Poles of all kinds of timber for carrying electric wires, per lineal foot :		
Poles 10 ins. diameter or less at the butt	1/4	"
Over 10 in. diameter at butt	1/2	"
Railway ties of all kinds of timber, per piece	2	"
Hemlock, lathwood, per cord of 128 cubic feet	20	"
Hemlock bark, per cord of 128 cubic feet	32	"
Futtocks, knees, floors of birch and other ship-building material, and all wood goods not enumerated in foregoing list, an ad valorem duty on the invoice	10	p. c.

The cord of 128 cubic feet is considered, for the purposes of this tariff, to be equal to 600 feet B.M.

The present rate of ground rent for licenses to cut timber shall not be increased until the 1st of September, 1910, andall license-holders who have conformed and shall conform to the regulations concerning the administration and sale of timber on Crown lands shall have, up to that date, the privilege of renewing their licences at the same rate of ground rent; and the dues now exacted by the regulations on all timber cut in virtue of a license shall not be increased before the said date of 1st of September, 1910.

DOWN ON THE SQUARE TIMBER.

By SID HOWARD, in Toronto Saturday Night.

Dan Milo, the raftsman, leans his chest against his cant-hook, his eyes squinting in the sun, while Louis—he of the green sweater—sits on a block and saws the end of a floating log at the edge of the crib. Dan comes from down below. He wears a tall grey plug hat, the top of which is held on with long stitches of grey yarn; a flannel shirt, and a pair of spiked shoe-packs. He is a compact, nimble little man, with the ease of carriage that comes from running loose logs and balancing oneself in ticklish places. And his eye has the richest twinkle in the world.

"Me?" says Dan. "I wear dis hat for coolness to the head. I do a lot of work in my mind, me, yeas."

"Yo hole dat log," says Louis.

"Certainment, miseu," returns Dan, with concerned politeness. "I love you dat well I will do so."

He flings his cant-hook dexterously over the log, jams the point, and rolls it over for Louis to get at it with the saw.

"This young Louis is a wicket man," says he. "Son, you pay no notice to him. He'll swear and smoke and drink. Yassir. You fell's ain't got some shin, eh? Hollan' shin. No?"

He looks reflectively at his shoe-packs.

"I'll drink Scotch whiskie dat you have some. Whiskey blanc? Yeas. You hev some of dat, eh? No? Dat's too bad."

His eyes grow round presently, round as glass marbles, and the rest of his features vie with each other to express surprise.

"Was I ever on de raf' in de storm? Me? Yeas! H'm. I guess I was so. H'm. Our tow we was sixty miles from de shore. Whitbee—you know Whitbee? Well, sixty miles from dere, straight out from de land."

This would have landed Dan rather high and dry in the State of New York.

"Sixty miles from de land. An' de waves—up an' down—ho!—dere was waves as high, as high—an' de raf'—she groan an' groan, an' de logs bob up an' down, and break away; yassir. De dam raf' bust up!"

The facial contortion during this narrative would certainly lead one to suppose something dreadful indeed had followed out so far in the lake that time.

"What did you do?" we ask, breathlessly.

"Ho, we all get on de boat," says he, calmly.

He looks at us cornerwise.

"Me? I come from Coteau Jonkshen. You been dere! Jee Cree, I live t'ree acre from Coteau. I hev a sixteen-dollar plug hat dere. You should see me walk down street wit' my gal."

"Un hole womon," says Louis.

"What is it?" shrieked Dan.

"You hole dat log," says Louis, chuckling at us.

Three weeks more and Toronto's annual square timber raft, destined eventually for Liverpool, and the English market, will be ready for the lake. Thousands of feet of the finest Canadian elm, seven ribs, or "drams," of rough-hewn logs three tiers deep, will lie at the Queen's Wharf waiting for the tug-boat. Chained in a string, they will float out some fine morning on the long journey down the lake, through the Thousand Islands and the rapids of the St. Lawrence to the coves of Quebec and the English timber ship. Brought down from the north and west of Old Ontario on the C.P.R. flat cars, shunted out on the long piers, rolled one by one into the bay with a pound and a far-flung splash, the great squared timbers rest for a while in the quiet, limpid waters of the Brock street slip. The old grain elevator casts it shadow over them in the morning, as it has done over many and many a raft of square timber in its time. Bare-footed, skinny-legged urchins run the low-floating logs after school in the afternoon, as many of us, long since staid and stiff, remember doing twenty years ago, when rafting went on in Toronto Bay all summer long.

Dan and Louis and the gang of French-Canadians jump about on the floating timber, pushing and prying in the field of logs, picking out the pieces they want and perilously navigating them under the "binders," which form the raft's framework. With crushed birch sapling withes, twisted by ironwook levers into knots tougher than ropes or chains, they lash each log, once in place, to the "binders." Two more tiers will be hauled up on top of the first one by the engine on the scow, and then, ho! for the open lake and the rapids and the long drift down the St. Lawrence.

"Yaw, hip; yaw, hip. Whoa. Un peu encore. Whoa!"

Dan, jumping six feet from log to log, sinks on a water-soaked timber above his shoe-packs.

"De water's good dis year," says he.

Over behind the elevator the Calvin Company boats from Garden Island are swallowing logs like minnows through the great flap-doors in the bows. The huge dripping timbers are sucked up out of the water and whisked end-on out of the sunshine into interior darkness. The engine away astern clanks and rattles as the hauling cable winds up on the drum. There is a sharp whistle and the clanking ceases. The heavy solid thud of timber comes from the cavern jaws in the bow. The Garden Island loggers shout in broken English away somewhere in the darkness of the hold. There is another whistle, the clanking recommences, and presently the end of the cable is hauled out into the sunshine. The man on the floating boom siezing the hooks, clasps them about the end of a fresh log much as a chunk of ice is gripped with the tongs. There is a shrill whistle and the clank once more of the engine. The cable stretches, and the log, climbing up the skidway, slides ponderously into the darkness. Again comes the shout.

"Whoa, hup?"

The spring softness hangs over the bay, over the low-lying island, over the roofs, tree-tops and steeples of the City of Churches. The three-masted, log-laden "Ceylon," of Kingston, bold and broad in the strong warm light, lies out in the deep water waiting for the breeze that will take her down the lake to the Calvin raft-builders at Garden Island. The Argonaut eight shoots out the Western Gap to where the open lake glints pale and oily in the afternoon calm. Over everything is the rich warm sunlight of the Canadian spring.

The man on the boom who feeds the log-swallowing monster hums a song of the Lower St. Lawrence as he stands waiting with his pike-pole.

"What tam is it?" says he, presently.

"Half-past four."

"Jee Cree, is dat all de tam it is? Un hour and a half yet. De clock goes slow, don' she!"

At the raft Dan bade us an affectionate good-bye.

"An' I want you fellows to understan'," said Dan, "dat de nex' tam you must bring t'ree ceegars, one for me—dat's de boss, one for him—dat's my clairk, and one for him—dat's my paymaster. But dem fell's over dere is to hev none, min' you. Dey's a bad gang, wicked men, dem fell's. Dey won' do what de boss tell dem. I fire all of dem ver' soon, you'll see. T'ree ceegars, min' you. You don' come down here on McCartee's raf' free for not'ing. No, sair."

SYSTEM AND EFFICIENCY OF ELECTRIC TRANSMISSION IN FACTORIES AND MILLS.*

By WILLIAM S. ALDRICH.

The recent progress in the use of electricity for the transmission of power over short distances has developed a new industry. It bids fair to rival in magnitude and usefulness the field of long-distance transmission, much earlier developed, and now almost exclusively held by electricity. As applied to factories and mills electricity is simply a means to an end, which is primarily the transmission of power over quite short distances, from 50 to 500 feet, and within one building or a group of buildings. Upon entering this new field it has had to contest every inch of its progress in competition with long-established usage, in order to displace the unwieldly and unsightly power transmissions by shafting, belting, and rope drives. In almost all cases of new manufacturing plants, however, the features of electric transmission have received thorough consideration, resulting in many factory installations in which this system is exclusively used.

Some manufacturers have hoped that electricity would solve all of the problems, and at once, upon its introduction into their establishments; others have known it would be of no use from the beginning. There are many factories and mills in which the introduction of electricity for power transmission will not pay, under existing conditions; there are more establishments in which it would pay, in which an investment in electric transmission would prove to be a dividend-paying investment. No general rules can be laid down. Each case must be carefully examined, and a most thorough preliminary survey made of all the conditions and requirements.

SYSTEMS OF ELECTRIC DISTRIBUTION FOR FACTORIES.

In choosing a system of electric transmission for manufacturing work, it is not necessarily

*Abstract of a paper read at the Cincinnati meeting of the American Society of Mechanical Engineers.

best to have that one system which will the most readily lend itself to all of the work to be performed, for light, heat and power service. A composite system may prove best suited, even in such short-distance transmission. That is, lighting service will, in general, be more satisfactory, and need not be more expensive, if supplied independently of the power service. Direct and alternating currents are equally adapted for factory transmission, and by simple or multi-circuit systems of distribution ; that is, by two, three, or four-wire systems, as the case may require. Preferably, all distribution should be direct ; that is, without the use of storage batteries, rotary converters, or transformers, except for certain lines of work in which it may be necessary to use one or the other of these indirect systems of distribution.

In the matter of voltages a wide range is possible: 110-volt two-wire and 220-volt three-wire systems for use of either direct or alternating currents for light and power; 440-volt two-phase alternating current three or four-wire systems for both light and power; 550-volt direct-current two-wire system, or 550-volt alternating current three-phase three-wire system, chiefly for power service, or the monocyclic system for both light and power. In general, it will not be necessary or advisable to use over 550 volts, direct or alternating current. Shocks arising from accidental contact with wires carrying currents of this voltoge are not necessarily dangerous. Experience has shown that workmen respect the distributing wires the higher the voltage. But it is not necessary to command such respect by raising it above 550 volts.

ELECTRIC TRANSMISSION BY DIRECT CURRENTS.

At the time that electricity was introduced into manufacturing establishments the direct-current system was the only one available. For the peculiar and exacting service required in driving all kinds of machine tools and various workshop appliances, there were difficulties to be overcome with any system. It was necessary to secure satisfactory methods of producing a large starting turning moment, or torque, for varying the speeds as might be required under uniform or variable loads, and for reducing to a minimum the trouble arising from the use of a commutator.

With direct current motors, it was a simple matter to introduce starting boxes (resistances) in the armature circuit to control the torque, as well as rheostats (resistances) in the fields to control the speed in particular. But every such resistance meant an expenditure of energy in otherwise useless heating of the wire or other material of which these resistances might be made. The so-called Ward Leonard system came to the rescue with its two additional machines in order to operate the one given machine as a motor, at practically a constant efficiency under all conditions of load and speed. This system has been very successfully and extensively used in elevators, cranes, etc. By the use of the auxiliary machines the supply voltage may be varied according to the speed desired, and the current supplied according to the torque required, without wasting any energy in heating wasteful resistances. For conditions of factory service permitting of such an application, two motors may be advantageously used on one machine or set of machines, by means of which it is possible to vary the torque and speed quite as satisfactorily as in street-car working, by the series-parallel method fo control.

The difficulties with commutators have been almost entirely overcome and many refinements in design effected, so that the direct-current motor of to-day leaves little to be desired. Such objectionable features as still remain are inherent in the direct-current system used, and are found to lie chiefly in the kind of armature, commutator and brush devices required. These parts are most liable to derangement, require systematic attention for cleanliness and efficiency and renewals of brushes.

ELECTRIC TRANSMISSION BY ALTERNATING CURRENTS—INDUCTION MOTORS.

The alternating current system, with its induction motor service, offered practically the only alternative to those engineers and manufacturers who did not care to be troubled with the petty annoyances and delays likely to occur at any time with the direct-current motor. The induction machine as it stands to-day is probably the most perfect motor yet developed from the standpoint of electric transmission in factories and mills. It may be started and operated from any point at any time, at practically any load and speed within its predetermined ranges. It may be used on 110, 220, 440 or 550-volt alternating current circuits of one, two or three phases. It does not require any direct-current supply as the synchronous motor does for its field excitation. It does not require any brushes, commutator or collecting rings. Offsetting these advantages, however, are certain restrictions. The speed of an induction motor falls off slightly as the load is increased. The ability to start an induction motor from rest under a heavy load, as well as the possible speed changes during its operation, are obtained at some sacrifice of efficiency.

Induction motors, moreover, permit of higher lineal speeds than are possible with any other type, from 6,000 to 7,000 feet not being infrequent. By suitable arrangements of its field windings, this type of motor may have its speed altered in regular steps, so reducing it one-half, one-quarter, one-eighth, etc. This makes possible similar changes to gear-wheel combinations, which may therefore be eliminated to the extent that the induction motor is installed to effect such changes. In almost all cases of shop driving, the slip is not objectionable, any more than the increasing slip of the driving belt as the load is thrown on. These motors will stand almost any amount of rough usage and heavy overloads, as they cannot be burned out. If excessively overloaded, the motor slows down and stops, starting up immediately as soon as the load is lightened. Ordinarily, machine tools and almost all classes of shop machinery are started at quite light loads, and the full load is thrown on when the work or the tool is up to the speed desired. For this class of work the induction motor seems specially fitted.

A larger generating power plant is required for an installation of induction motors than would be the case if direct-current motors were used. This is on account of the energy which is lost in all classes of alternating current circuits in which there is considerable self-induction, whether in the transmission wires or in the appliances used. In the case of induction motors this loss is very appreciable at light loads, becoming much reduced at average and heavy loads, at which it is almost uniform.

SYNCHRONOUS MOTORS.

Synchronous motors are admirably adapted to factory service where absolute uniformity of speed is required, and where the extra installation of a direct current supply for their field excitation is not deemed objectionable. While induction motors are always wasteful of some energy, through their high self-induction, synchronous motors may on the other hand be brought into that condition of operation practically equivalent to the use of direct-current motors, at least for a large range of their loads. In other words, the power factor of a synchronous motor may be made almost anything from zero to unity, according to the extent of excitation of its fields by the direct current applied for this purpose.

When made in the revolving field type, synchronous motors are self-starting from rest at light loads. They may be very heavily overoaded, without falling out of synchronism or out of step, and when they do for an instant they may be brought back again by throwing off some of the load. A well-designed synchronous moter will carry at least three times its full normal load, and not drop out of step. If an induction motor is built for such overloads it is likely to have quite low efficiency at ordinary loads.

Higher efficiencies may be obtained with synchronous motors than with induction motors of the same output. In fact, such motors realize the ideal conditions of motor working in which the motor attains almost the same efficiency as the generator. Both induction and synchronous motors have usually higher efficiences than direct current motors of same size.

COMBINED INDUCTION AND SYNCHRONOUS MOTOR WORKING.

The ideal conditions in a factory installation no doubt would be secured where both iuduction and synchronous motors were used, the former for small machines and direct driving, the latter for operating a set or group of machines. The synchronous motors would be started up just before beginning the work of the day, have at all times a light constant load, and might easily be regulated as to produce an almost balanced system in combination with the induction motors. In such a system of transmission the lagging currents of the induction motors would be offset by the leading currents of the synchronous motors, if the latter were operated to produce such leading currents. The whole system would be operated practically throughout quite a range or load variations, as if it were a simple direct current system. the advantage of such a condition is apparent ; it means least installation for any given output, or greatest output for any given capacity of of generating plant. The group method of electric driving is much better adapted for small machines, up to and including 2-horse power capacity, and especially where such machines are in almost constant service. Above this size, individual motor driving becomes more and more efficient, particutarly if the machines are operated only a fraction of the day.

WOOD PULP DEPARTMENT

ELECTRIC LOCOMOTIVE FOR A PULP COMPANY.

The accompanying illustration represents an electric locomotive recently built at the shops of the Quebec Railway, Light & Power Company, of Quebec city, for the Chicoutimi Pulp Company, of Chicoutimi, Que. It is intended for the shunting of regular freight cars about the company's yards, and for hauling the products from the mills to the company's wharves on the Saguenay river. It is also capable of hauling two loaded flat cars from the wharves back to the mills.

The locomotive weighs about 23 tons, and in a trial test hauled twelve of the Quebec Railway, Light & Power Company's passenger cars, aggregating a total weight of 255 tons, at a speed of ten miles per hour with comparative ease. The railway lines of the Chicoutimi Pulp Company consist of about two miles of track, having an average grade of 2 1-2 per cent The only real heavy grade on the line is 400 feet of 5 per cent. grade and 39 degrees curvature, so that the new electric car will doubtless be capable of performing the work intended of it.

SUGGESTIONS FOR THE PULP TRADE.

The annual report of the High Commissioner for Canada to the Dominion Government contains two interesting letters concerning the pulp and paper trade. The first is from the British Wood Pulp Association, and reads as follows :

In reply to your communication of the 9th inst. my association desires me to bring the following points under your lordship's notice.

(1.) That it is strongly to be recommended that the sale of wood pulp be placed in the hands of respectable firms in England, well-known to the trade, instead of, as is now frequently the case, through speculative adventurers who have absolutely no knowledge of the article in question. There are several firms well-known in the wood pulp trade of the United Kingdom who will offer every financial and commercial assistance to any Canadian mill, as the desire of the pulp merchants and agents in England is to help forward the Canadian pulp maker by every legitimate means. Incalculable harm is done by irresponsible people in Canada and England offering and selling pulps of which they are not possessed, or on the calculation of which they have made absurd mistakes, such as failure to calculate the freight on the water contained in the pulp, or differentiating between the Canadian ton of 2,000 pounds and the English ton of 2,240 pounds, which ends in considerable fricton and confusion in contracts. This tends to the belief, more or less prevalent among paper makers, that they cannot rely upon getting the Canadian pulp they buy, and is most injurious to a developing trade.

(2.) Nova Scotia and New Brunswick are especially to be recommended for future developments, owing to the facilities for shipping all the year round.

(3.) If the resources of Quebec and the mouth of the St. Lawrence are to be developed as they should be, it is imperative that they should be placed in a position to ship their pulp all the year round. As far as we can see, there is no reason whatever why pulp should not be shipped from this district, and particularly from the Saguenay river, during at least ten months in the year, and all the year round in favorable seasons. In Scandinavia, where the weather is, at least, as severe, many ports are kept open by ice-breakers. Moist mechanical, containing as it does 50 per cent. of water, cannot possibly be shipped via the winter ports of St. John and Halifax, as the rail rates at their lowest would, when prices are normal, be about one-third of the actual cost of manufacture, and competition at such a charge is impracticable.

No assistance whatever is rendered by the Government to anybody trying to make use of the natural facilities of the Saguenay river in winter, and we have heard of a ship which sailed thence on November 23rd last, when all the buoys were up, and all the lighthouses, we understand, closed. A little assistance from the Government in the way of ice-breakers or subsidies, would enable shipments to be made practically all the year round. At present it is impossible on account of the enormous charge for insurance incurred when navigation is not assisted by buoys and lights.

(4.) Respecting chemical pulp, it cannot be too strongly impressed upon manufacturers that

ELECTRIC LOCOMOTIVE USED BY THE CHICOUTIMI PULP COMPANY.

they should secure the best technical advice, for, though the quality has improved of late, much has still to be done to bring it up to the standard of German and Scandinavian manufacture. The wood and water are everything that can be desired, and there is no reason why the quality should not be of the finest. More care also should be exercised in the drying of the pulp, which is at present, anything but uniform.

'It is also regretted that the facilities for dealing with the shipments at the various ports are very defective, it being not an usual thing for goods to be detained there for several weeks before finding shiproom, thereby causing great inconvenience and much annoyance to buyers.

The second letter is from the British Paper Makers' Association, and is printed in part below :

'The paper makers of Great Britain are watching very carefully opportunities offered in Canada for pulp and paper making, but while admitting the spruce of Canada (and spruce, up to the present, is the only Canadian wood which can be considered pulp wood) makes first class pulp, in fact almost the best, the British source of supply is not confined to Canada, as the following figures will show :—

'During 1900 Great Britain's importations of ground wood and sulphite pulp were as follows :

	Tons.	Per cent.
From Scandanavia.....	400,027	81-834
" United States.....	12,006	2-456
" Canada	55,592	11-373
" Other countries....	21,202	4-337
Total..... ...	488,827	

'The question we ask ourselves is, why does not Canada supply a larger proportion of the requirements of Great Britain ? The first and most serious obstacle is the question of freight and transportation. Pulp, to meet the requirements of the English paper maker ought to contain 50 per cent. moisture, so that on every ton of ground wood pulp, freight has really to be paid on two tons. The average freight from Norway is about 6s. per wet ton, or equal to 12s. per dry ton. From Canada outside Nova Scotia, during last year, from 15s. to 30s. was paid (say 20s. wet or 40s. per dry ton); this makes a difference of 28s. per dry ton in favor of Norway. Then, from Norway shipments can be made all the year round ; from Canada shipments are confined to about six months of the year. This means accumulated stocks which in turn means loss of interest, or the alternative of sending by rail to Halifax or St. John. If the latter course is adopted the difference in favor of Norway becomes still greater. This difficulty may in time disappear, if, for instance, Quebec could be kept other rivers made navigable in winter by means of ice-breakers; meantime these difficulties exist open as a winter port, and the Saguenay and and unless the railway companies will give cheaper rates to the port of shipment than they have yet done, we fear the shipment of pulp during the winter will remain impossible. As a part off-set against this Canada has, of course cheaper wood than in Scandinavia, but this difference does not fully compensate for the advantages possessed by that country. Futther inducements will have to be made to capitalists to invest in the pulp industry, and the first thing to do will be to make the stumpage rebate more effective. From an interesting paper read at Ottawa by J. C. Langelier, Superintendent of Forests for Quebec, on March 7th, we are brought face to face with the fact that in the supply of spruce wood from Canada, the American manufacturer is really on more advantageous terms than the manufacturer in Canada himself. He shows how the difficulty of stumpage is got over by bogus settlers stripping the land of its spruce and supplying the American market. Settlers do not pay stumpage and the export duty is not only therefore ineffective, but the stumpage which in the ordinary way should come to the Government, is lost. The American timber limits being held in fee simple, the manufacturer in the States simply leaves his forest alone until he has drawn every cord of wood he can from Canada at a low price. When it will no longer pay to draw from this source he can fall back on his own forests. This condition of things will not encourage the starting of pulp mills in Canada. The trouble does not end here, however; the Canadian has supplied the raw material at this low price to the American manufacturer, and the latter having command of a better class of labor and being without the Canadian difficulties in shipping, he is able to undersell the Canadian paper makers in England with the manufactured paper. The remedy would seem to be an export duty on all spruce pulp wood both from Government and settlers, limits, or a law passed that it must be manufactured into pulp in Canada. One industry brings another, and if pulp and paper mills were more numerous it would be a great incentive to the starting of other industries. What is wanted in Canada is the manufacturer not the speculator, and the governments of the different provinces should protect genuine investors. Let us have authentic reports on the water

wers and timber limits. To get these will st money, but it seems only common sense at a government should know what it is sell- g or giving away in a concession. Such expen- ture could form part of the price asked. Wa- r powers as a rule require a large amount spent development, apart altogether from the mills. he development of a power sometimes interferes rests out, and transfer them to those who un- rtake in good faith to establish factories. In ort, in the case of water powers owned by the overnment, steps should be taken to settle the estion of vested interests, right away, the ying out of same also to form a charge on the ie of property. A great many English firms ve considered properties in Canada, but when ey make enquiries they invariably find that if ey were to develop a power, they would flood -and-so's land ; that if they were going to build work suitable to that power, they find most of the surrounding land held by different owners, who are simply waiting for the chance of exact- ing exorbitant prices for what has cost them with small invested interests, but it is unconceiv- able that these should be allowed seriously to re- tard the establishment of large industriesf The Government should have power to buy these in- little or nothing, and what is really of no value to them apart from the value given to it by other people. English paper makers have not time to spend in overcoming these difficulties ; it simply makes purchase impossible. The Gov- ernment should be in a position to say: Here is a water power ; if you buy it we guarantee you all the land necessary for your works, free from claims from flooded land and other risks ; our price is so much. This would prevent specula- tors dealing in properties and would encourage the legitimate capitalist to invest his money in the country, since he would start equipped with the essentials necessary for success, namely, water power and timber, and a prospect of de- voting his time and energy to the building up of a factory, and not, as has too often been the case hitherto, to counteracting the machinations of the crafty speculator or the wiles of the local landowners or option holder."

NEW PULP WOOD REGULATIONS.

It is announced that the Quebec Government has decided on a change in its stumpage dues on pulp wood. It will be remembered that last year the Government altered the rate. Up to that time it had been unconditionally 40 cents a cord. It was then changed to $1.90 a cord, a condition of this rate being that $1.50 per cord should be re- funded on all pulp wood manufactured in the Province. The meaning of this was that pulp wood sent out of the province to be manufactured should bear an additional and discriminatory rate

THE JENCKES MACHINE CO.
36-40 Lansdowne Street - SHERBROOKE, QUE

of $1.50 per cord. Thus the discrimination, so far as the wording of the act was concerned, did not spare Ontario more than it did the United States. A point to be noted is that the cord, as fixed by the Act, meant 1,000 feet board measure.

Now the Quebec Government proposes to reduce the gross rate from $1.90 to 65 cents, and make the rebate 25 cents instead of $1.50, thus leaving the net tax 40 cents a cord, what it was before. But the out tax will really be nearly doubled, if a further part of the announcement is correct, namely, that the cord is to be fixed at only 600 feet board measure. Further the rebate is to be allowed not only on timber manufactured in the province, but anywhere in the Dominion.

PULP NOTES.

The wood pulp market in England, both for chemical and mechanical, is quiet and prices rule comparatively low.

The Pulp Manufacturers' Association held a meeting in Boston last week and fixed the price of pulp at $37.50 a ton.

It is announced that a company has been organized at Seattle, Wash., to develop the pulp industry of British Columbia.

Hatch & Backus, of Chicago, have been negotiating with the Ontario Government for a water power at Fort Francis, in the Rainy River district, the intention being, it is said, to establish a pulp mill.

It has been decided to wind up the affairs of the Consolidated Pulp & Paper Company, of Toronto, which recently became financially embarassed. The liabilities amount to $168,000, with assets below that amount.

New York capitalists are said to be negotiating for the purchase of 30,000 acres of woodland, owned by the Nova Scotia Electric Light Company at Gaspereau, N.S., with the intention of starting pulp and paper mills at White Rock.

The Ouitachouan Pulp Company, of Ouiatchouan, Que., have let the contract for the necessary water wheels for driving their proposed mill to the Stilwell-Bierce & Smith Vaile Company, of Dayton, Ohio. The mill will have a capacity of 30 tons of pulp per day.

T. G. McMullen, M.P., of Truro, and Alfred Dickie, of Lower Stewiacke, N.S, are the principal promoters of the Grand River Pulp & Paper Company, which is to conduct extensive operations in the manufacture of pulp and paper in Newfoundland and Labrador.

The Blanche River Pulp & Paper Company, which purposes building mills at Mattawa, Ont., have, in consideration of an extension of time for completion of their work, agreed to expend $750,000 instead of $200,000 as originally planned. The company agree to expend $50,000 by the end of the present year, and to complete their works by October 14, 1905.

We have received a copy of the prospectus of the Boston & Nova Scotia Wood Pulp Company. This company is incorporated under a special charter, and now controlls, by purchase and option, a total of 10,000 acres of spruce timber lands running from 25 to 60 cords to the acre. It is proposed to operate at Wentworth, Cumberland county, N.S. Hon. Edward M. Tucke, of Lowell, Mass., is president of the company, and Charles M. Meserve resident manager at Wentworth.

The Saguenay Water & Power Company are making progress towards the establishment of a large pulp mill at the Grand Discharge of Lake St. John, in the province of Quebec. The capitalists interested are mostly New Yorkers, but the name of B. A. Scott, lumberman, of Roberval, Que., has been mentioned in connection with the scheme. The pulp mill, we are told, will have a daily capacity of 600 tonsf The location of the limits available is on both sides of the Saguenay river, which is the outlet for Lake St. John and about 230 miles north of Quebec.

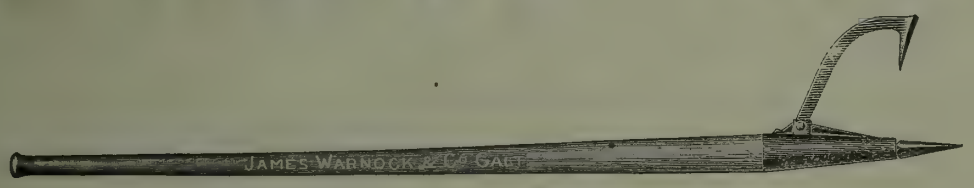
SOMETHING SPECIAL



We direct your attention to the above illustration of our **NEW PEAVEY.** Its good points will at once be apparent to and appreciated by all practical lumbermen.

Note the improvement in the socket—a fin running from the base of the hook to point of socket.

It is made of the very finest material, and is the most practical and up-to-date Peavey on the market.

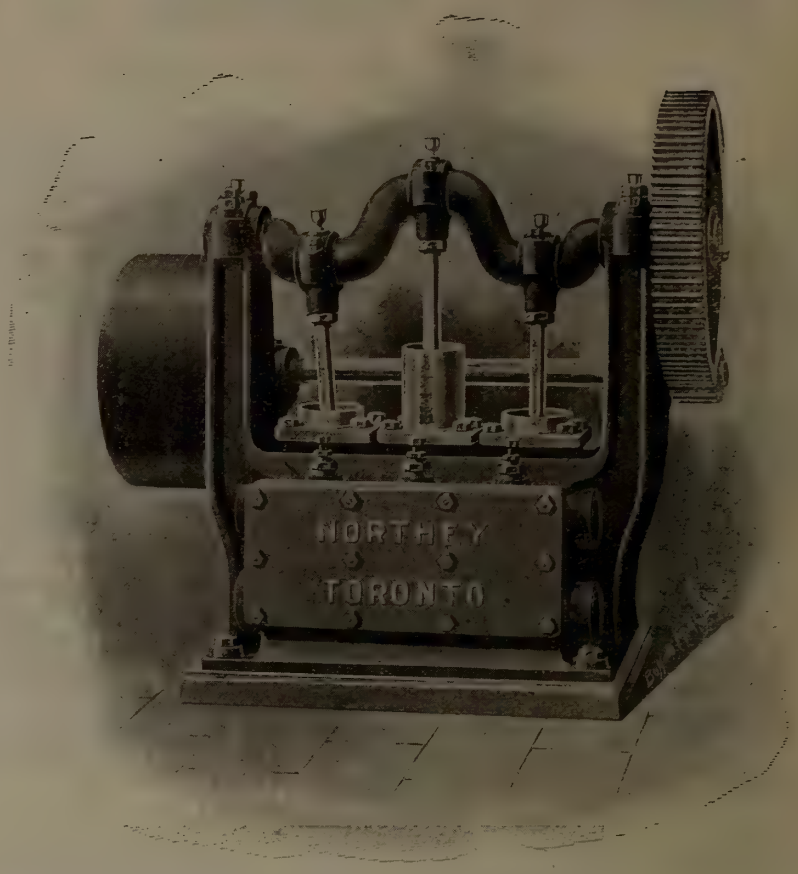
Northey Triplex Power Pump

FOR BOILER FEEDING
AND
GENERAL PRESSURE PURPOSES

In the Northey Triplex Power Pump we offer a machine put together with the skill brought by years of experience in pump building, and with full provision made for the varied demands likely to be made upon a pump of this character. A feature of value is that the three cranks are placed 120 degrees apart, thus giving a practically constant flow of water—minimizing strain on pump and economizing power. The pump can be readily repacked and taken up, and all details are carefully worked out. It can be conveniently operated by electricity, by water power, or by belt from engine. Different styles and sizes made to suit all duties.



WE ARE MANUFACTURERS OF OVER FIVE HUNDRED DIFFERENT STYLES AND VARIETIES OF STEAM AND POWER PUMPS FOR STATIONARY AND MARINE PURPOSES. WE INVITE ENQUIRIES FROM ENGINEERS, MINE SUPERINTENDENTS AND OTHERS FOR THEIR REQUIREMENTS IN OUR LINE. CATALOGUES AND SPECI FICATIONS FURNISHED UPON REQUEST.

We are also manufacturers of the Northey Gas and Gasoline Engine which has proved to be the handiest and most convenient power for small or intermittent power users in the market. Suitable for machine shops, pumping and electric light plants, etc. Write for illustrated descriptive booklet.

VOLUME XXI. NUMBER 8. | TORONTO, CANADA, AUGUST, 1901 | TERMS, $1.00 PER YEAR Single Copies, 10 Cents

MR. GEORGE H. PERLEY.

One of the best known and most successful of Ottawa's lumber merchants is Mr. George H. Perley, head of the firm G. H. Perley & Company, now consisting of the same partners as the Hull Lumber Company. This firm's center of industry is at Calumet, a town at the juncture of the Ottawa and Rouge Rivers and situated on the North Shore line of the Canadian Pacific Railway midway between Ottawa and Montreal. Mr. Perley's home and head office are, however, in Ottawa.

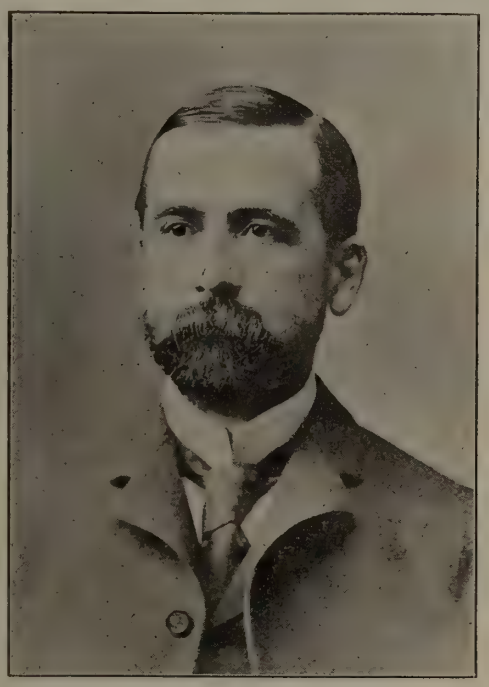
This is the third season the mill has been operated by the present owners, who secured it from the Ottawa Lumber Company, as it was then called. It is an old fashioned mill fitted with five upright gates. A lath mill is also operated, as well as machines for the manufacture of studding and furring for the building trade. The mill is run by steam, and work is continued night and day. The yard and mill are illuminated by electricity, power for the plant being furnished at the mill. About 250 men are employed in and about the mill. Last year's cut amounted to 21,000,000 feet. It is expected that fully 25,000,000 feet will be cut this season.

The lumber sawn consists of spruce deals for the English market and smaller sizes for the American trade. Shipments are made by water and also by the C. P. Ry. and C. A. Ry. lines. The latter line has connection with Hawkesbury across the river from Calumet, and the lumber is taken from the mill to the C. A. Ry. yards across the river on scows.

The Rouge is a river which rises and falls rapidly, thus affording considerable difficulty to the handling of logs. This trouble is overcome by an immense boom which was built at the mouth of the river a couple of years ago. This boom is considered to be one of the largest and strongest in the Ottawa district. It has a capacity of about 600,000 logs, and about 1,000,000 pieces are gapped annually. The limits that supply the Calumet mill are situated on the Rouge River about 100 miles from its mouth. They are 600 miles in extent and covered with splendid spruce forests.

Mr. Perley is vice-president of the Hull Lumber Company, and associated with him are Messrs. W. G. White, of New York, and C. E. Read and F. W. Avery, of Ottawa. Since the destruction of its large mill at the Chaudiere in the memorable Hull-Ottawa fire on April 26th, 1900, the company has operated smaller mills at Ottawa and Aylmer, and will this year saw thirty-five to forty million feet of pine logs which were cut on the company's extensive limits on the Upper Ottawa.

The subject of this sketch has been identified with the lumber interests in and about Ottawa all his life. He is the eldest son of the late Mr. W. G. Perley, who at the time of his death represented the Capital City in the House of Commons. Mr. Perley, sr., was a member of the well-known and long established firm of Perley & Pattee. Nearly half a century ago, the firm operated a large mill on the site of the present Booth mill, at the Chaudiere. It was sold to Mr. J. R. Booth eight years ago, and was remodelled and operated by him after the destruction by fire of his large mill adjoining. Perley & Pattee had extensive limits along the Ottawa river and tributaries, and were prominent in the square timber, as well as in the mill business. Mr. G. H. Perley was actively engaged in this business for fifteen years, and



MR. GEORGE H. PERLEY, OF OTTAWA.

as a young man laid a successful foundation for his business career.

Mr. Perley is 44 years of age. He received his early education at the city's famous grammar school, and afterwards took a very creditable course in Harvard University. From that institution he received the degree of Bachelor of Arts. Mr. W. G. Perley was actively identified with Mr. J. R. Booth in the building of the Canada Atlantic Railway. For several years his son held the position of vice-president of the road. No man holds in a higher degree the confidence and esteem of the community than he does. In 1897 he was appointed Chief Executive Officer of the committee having in charge the distribution of the Prescott and Russell Fire Relief Fund. Nearly $50,000 was distributed amongst 592 owners and tenants of the two counties burned out in the destructive fires. Last year he was Chairman of the Ottawa and Hull Fire Relief Fund Committee, when over $956,000 was distributed. Mr. Perley in both positions displayed administrative ability that did him credit. The problems he was called on to solve would have dismayed many a man. He has taken a keen interest in all things pretaining to Ottawa and the Ottawa Valley. He is a member of the Rideau Club, and an enthusiastic member of the Ottawa Golf Club. Mr. Perley occupies a palatial residence on Ottawa's Fifth avenue, Metcalfe street.

TIMBER RESOURCES OF ARGENTINA.

The forest resources of Argentina, South America, are among the richest in the world, but are remote from the ocean, and thus expensively reached, if reached at all. The forests of the interior of Argentina, throughout the north and the northwest, on the eastern mountain slopes and in the valleys of the Uruguay and Perena rivers, are famed for their richness in timber resources. In that country there are fully 500 varieties of woods, with no less than 100 of utility in commerce. But the richer timbered areas lie remote from the seaboard and away from centers of consumption. Hence, there, as in Brazil, it is often cheaper to import lumber than to cut it at home. Brazil has a tropical profusion o useful woods. In the province of Amazonas alone there are thirty kinds of building lumber and thirteen kinds available for cabinet purposes. But labor is scarce, and the means of transportation are so imperfect that the production goes little beyond the demands of local consumption.

It has been found by some experimenting that the method of covering steam pipes with sawdust mortar is more successful if the sawdust, at the given proportions of one of lime to five of sawdust, is mixed with the quicklime just as it is slaking. The use of cottonseed hulls at the rate of one of lime to eight of hulls, mixed with air-slaked lime, at any time, gives even better results. The air-slaked lime is much cheaper than quicklime. Fine sawdust is preferable to coarse, the lime causing the disintegrating of the fine particles of dust and making a practically air-tight cover. Either cover should be applied wet and not disturbed any more than possible while it " sets."

The following method of lacing a belt with wire is recommended by a mill foreman: Punch small holes 5-16-inch from the edge and the same distance apart, and lace the wire through the holes and around a piece of round iron or stick about the size of a lead pencil, pulling evenly. Treat both ends alike, and, withdrawing the stick, join the end, lapping wire rings thus formed. Draw a piece of lacing about a quarter of an inch wide through the lap of the wire, and cut off, leaving about a half inch to draw. This makes a hinged wire lace, the wearing qualities of which are said to be unsurpassed.

THE SAW MILLS OF CACHE BAY, ONT.

Cache Bay is one of the lumbering villages on the north shore of Lake Nipissing, on the Canadian Pacific Railway. Although a large portion of the village was recently destroyed by fire, the saw mills, which provide employment for a large number of workmen, were saved. The village is located 26 miles west of North Bay and 53 miles east of Sudbury. Cache Bay, from which the village takes its name, is a narrow bay about five miles in length, extending north from the main lake. The word "cache" in French literally signifies "hidden." In the old days of the French trappers and voyageurs, it was customary for parties to leave a portion of their supplies at certain points until their return, and it is said that Cache Bay was one of those points where supplies were stored. The population is about nine hundred.

SAW MILL OF GEO. GORDON & CO., CACHE BAY, ONT.

There are two steam saw mills in the village, the larger one being owned by George Gordon & Company, of Pembroke, and being shown in the accompanying illustration. The firm manufacture lumber, lath and shingles, and square, waney and dimension timber. They have extensive timber limits on the Sturgeon, Veuve and Wahnapitae rivers, and one large limit on the south shore of Lake Nipissing, which was purchased by them a couple of months ago.

The capacity of the mill is 140,000 feet per day. One wing is 96 feet long by 90 feet wide; the other 100 feet long by 50 feet wide. The mill is equipped with the latest and most improved machinery, including one band saw, one gang, two circular saws, two double edgers, two sets of trimmers, three steam-feed saw carriages, three steam log canters, two log hauls, one slab slasher, one shingle mill, and one lath mill. The refuse burner is 21 feet wide and 110 feet high. The power equipment comprises two engines, one 20x24 and the other 24x30, and six large boilers.

The lumber is carried on transfer and live rollers to the sorting tables and conveyed from them on lorries on tramways to the piles. There are seven C.P.R. sidings of over 2,000,000 feet capacity each in the yard, and the lumber is loaded direct from the piles on to the cars. The second illustration is a view of the yard. The mill and yard are lighted electrically from a private plant on the premises.

The members of the company are Messrs. George Gordon, Robert Gordon, and Robert Booth, all of Pembroke. Mr. Robert Booth is a nephew of Mr. J. R. Booth, of Ottawa. Mr. Alex. McCool, formerly of the Pembroke Lumber Company, is foreman; Mr. J. F. Stewart, shipper; W. J. Swan, bookkeeper; J. M. Sarsfield, timekeeper; R. H. Millord, chief filer; and R. J. Storey, engineer.

GRADING OF CO-OPERAGE STOCK.

The following are the grades and specifications adopted by the National Slack Cooperage Stock Manufacturers' Association, of the United States, at its annual meeting held at Toledo, Ohio, on May 21st:

Staves.—Elm staves 30 in. long shall be cut not less than 5 staves to 1 15-16 in. in thickness. Elm staves 24 in. to 28 1-2 in. long shall be cut not less than 5 staves to 1 7-8 in. in thickness, except 24 in. of keg staves when specially cut, when said staves shall be cut 6 staves to 2 in. in thickness.

Cottonwood staves of all lengths shall be not less than 5 staves to 2 in. in thickness.

No. 1 staves shall be of full thickness and uniform throughout, free of knots, slanting shakes, doty wood or other defects.

Meal barrel staves shall be free of slanting shakes over 1 1-2 in. long, knot holes, unsound knots (but sound knots of not over 3-4 in. in diameter shall be allowed), free of thin staves, and shall consist of good, sound workable staves.

No. 2 staves shall be free from dead culls.

Mill-run staves shall consist of the run of the knife, made from regular run of stave logs, dead culls thrown out.

Special Stock.—White ash staves shall be cut 5 staves to 2 1-8 in. in thickness graded the same as elm, but only No. 1 and No. 2 quality.

Mill-run or hardwood apple barrel staves shall be cut 6 staves to 2 in. in thickness, and shall consist of the run of the mill, from the regular run of stave logs, dead culls thrown out.

Mill-run cottonwood apple barrel staves shall be cut 5 staves to 2 in. in thickness.

All of the above staves shall average in measurement 4 in. a stave or 4,000 in. a 1,000 staves across the bilge, with the exception of the keg staves, which shall measure 160 in. a bundle of 50 staves, across the bilge, and 24 in. half barrel staves, which when not otherwise specified shall measure 3 1-2 in. wide of 175 in. a bundle across the bilge. All other staves not specifically mentioned shall be sold according to the local custom or under special arrangement.

Hoops.—Sugar barrel hoops shall be 6 ft. 4 in., 6 ft. 6 in. and 6 ft. 9 in. long, cut so as to be not less than 5-16 in. and 3-16 in. in thickness when finished and seasoned, and not less than 1 3-8 in. wide when seasoned.

Flour barrel hoops shall be 5 1-2 ft. and 6 ft. long and shall measure when seasoned not less than 5-16 in. and 3-16 in. in thickness and not less than 1 3-8 in. wide.

Keg hoops shall be sold on special specifications as agreed upon between buyer and seller.

No. 1 hoops shall be of good, sound timber, fully up to specifications, free from broken hoops in the coils, and well finished.

N. 2 hoops shall be free from broken hoops in the coils, and otherwise fully up to specifications.

Heading.—No. 1 basswood or cottonwood heading shall be made from good, sound timber, free of damaging defects, of such diameter as is required, well jointed 1-2 in. in thickness, and thoroughly kiln dried.

No. 1 hardwood heading shall be of the same specifications as above, but only 7-16 in. and thoroughly kiln dried.

Mill-run heading shall be the run of the mill, dead culls out, thickness and dryness the same as No. 1.

No. 2 heading shall be the heading thrown out of the No. 1, dead culls out. All staves, hoops and heading not specifically mentioned shall be bought and sold on terms and specifications agreed upon between buyer and seller.

BURNING GREEN SAWDUST.

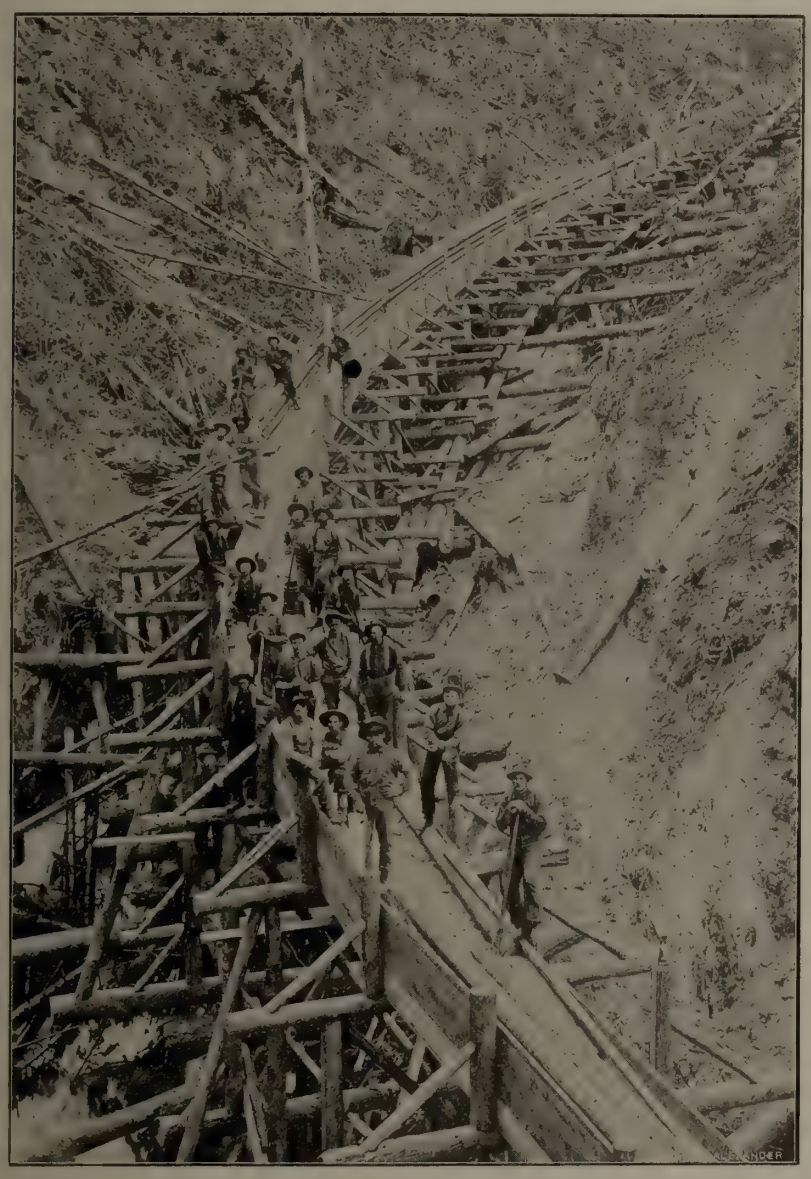
Having received a letter from one of the readers of The Wood-Worker who finds it difficult to make steam enough to run his plant in the winter season when burning green elm sawdust, and as I believe others have the same trouble, it will be profitable to review the whole situation for the benefit of all concerned.

YARD OF GEO. GORDON & CO., CACHE BAY, ONT.

My correspondent informs me that there are 1,500 mills of his class in the United States and Canada, many of which have the same trouble, consequently he wants to know how many square feet of heating surface in a boiler will produce one-horse power while burning green sawdust. As my conclusions may conflict with others in this respect, it is proper to give reasons in full, especially as these will enable others to tell whether their plants are properly proportioned to do good work or not. This plant contains a

10x16 inch automatic engine, revolving 190 times per minute, with a boiler pressure of 90 pounds. As indicator diagrams are not furnished, it will not be possible to tell just how much power this engine is developing, and the next best thing is to determine how much power it can develop under fair conditions.

The area of a 10-inch circle is 78 square inches, and the piston speed is 507 feet per minute. The mean effective pressure is taken at one-half the boiler pressure, making it 45 pounds. When we multiply these three together and divide the product by 33,000, we find it can develop 54-horse power. Large engines of this type will develop 1-horse power on 30 pounds of water per hour, but for one of this size it will be necessary to allow 35 pounds, calling for 1,890 pounds per hour.



Columbia River Lumber Company, Golden, B.C.—Hanna's Camp. Slide for driving logs almost completed, 700 feet long and drop of 125 feet. Photo taken on May 10th. That night the reserve dam in the mountains burst and swept entire work away.

There is also a slide-valve engine in this plant that is 11 by 14 inches, revolving 225 times per minute. The area of an 11-inch circle is 95 square inches; the piston speed is 525 feet per minute, and the mean effective pressure is taken at 45 pounds, which makes 68-horse power. We must allow 50 pounds of water per horse power for this engine, making 3,400 pounds per hour, or 5,290 pounds for both engines.

Let us note whether we have boiler capacity enough to supply this easily or not. One-horse power at the boiler consists in evaporating 30 pounds of water in one hour under conditions that are about the same as found in this plant, so that to run these engines the boilers must supply 176-horse power.

We will next note whether they are in condition to do this or not. The diameter of the shells is 54 inches and they are 14 feet long, with 46 tubes 3 1-2 inches in diameter. This makes 98 square feet of heating surface in the shell, and 550 in the tubes, or 648 for each boiler, and as there are two of them they both contain 1,296 square feet of heating surface.

Now, if 1,296 square feet of heating surface is to supply 176-horse power it is allowing only 7 1-2 square feet for each horse power, which is evidently much less than it ought to be, as at least 15 should be allowed. Is it any wonder that they have hard work to keep up steam in the winter time when the sawdust is frosty and may have ice and snow mixed with it? It is usually claimed that there is not work enough on the engines in these mills to call for their full capacity. This may be true, but my experience has been that in cold weather, when the shafting turns hard in its bearings, and exposed pipes and engines cause much condensation of steam, the full power is called for during a portion of the time at least, so far as the boilers are concerned, and usually they are not large enough to furnish it easily. If only one-half the engine capacity is called for in the above-mentioned case, each horse power must be developed by 15 square feet of heating surface, which is about right where coal or dry wood is used, but is not enough for green sawdust. It should be increased to 20 at least, in this case.

Failure to make steam enough in these mills is usually due to two causes, one of which is that the power estimated as enough to run the machines is less than really is called for in practice. The other reason may be explained as follows: The power of a boiler is computed by its ability to evaporate 30 pounds of water in one hour for each horse power; therefore if a man buys a 60-horse power boiler and puts in a 50-horse power engine, of a type that requires 50 pounds of water per horse power per hour, it is no wonder that he can not keep up steam easily, for while his boiler is calculated to evaporate 1,800 pounds of water per hour, the engine must have 2,500 pounds, if it has a full load.

There is another point that I wish to call attention to in this connection, as follows: Each of these boilers has 46 tubes each 3 1-2 inches in diameter, so that the combined area of their openings is 382 square inches. The area of stack should be about 20 per cent. greater than this in order to secure best results. This brings the whole up to 458 square inches, so that the stack should be 2 feet in diameter and none of the connections between it and the tubes should be less than this. For two boilers it should be 34 inches in diameter, and whether for one or more boilers it should be 80 feet high above the grates. Stacks that are smaller and shorter than this are used every day in the year, but the best results are not obtained unless they are at least nearly as large and as high as the above calculation calls for.

A plant that gave very good results when burning wood, green sawdust, etc., was proportioned as follows: The engine was 11x30 inches and revolved 72 times per minute. With a mean effective pressure of 40 pounds (one-half the boiler pressure) it could develop 42-horse power. The boiler contained 900 square feet of heating surface. Calculated on the above basis the engine called for 50-horse power at the boiler, which was an allowance of 18 square feet of heating surface for each boiler horse power, or 21 square feet for each horse power that the engine could develop. As the work of sawing is unsteady it did not develop this continually, but for portions of the day it came fully up to it. As I was perfectly familiar with this plant before the mill was burned, I consider it a good practical example of what can be done, as much green chestnut sawdust was burned for fuel.

Taking all of these things into consideration, the following rule for determining the number of square feet of heating surface that will be required in a tubular boiler that is to be fired with sawdust, will answer provided the engine is in good order. When the valves and piston leak steam there is no way to determine the amount required, except to give it a trial.

Rule: Multiply the area of the piston in square inches by its travel in feet per minute, and by one-half the boiler pressure. Divide by 33,000 and the quotient will be the horse power of the engine. For an automatic engine, multiply the horse power by 18. For a throttling engine, multiply by 25. This will be enough to supply steam when cutting off at about one-quarter stroke in the automatic engine, and its equivalent in the throttling.

The mills and booming privileges of Miller & Woodman, at Pleasant Point, N.B., have been sold to A. Cushing & Company, of St. John, at a price said to be in the vicinity of $20,000.

Sir Henry Joly, Lieutenant-Governor of British Columbia, who has always taken a deep interest in the subject of forestry, has undertaken to test the growing in British Columbia of some of the trees of Eastern Canada, and in November last planted some seeds of black walnut, butternut, white ash, green ash, red oak and maple. A large percentage, it is said, have started growth. The Lieutenant-Governor will make comparisons of the growth of such trees in Quebec with their development in British Columbia. After the trees have attained a satisfactory size for transplanting, it is his intention to distribute them among those who may be interested in such matters.

Canada Lumberman

MONTHLY AND WEEKLY EDITIONS

PUBLISHED BY

The C. H. Mortimer Publishing Company
of Toronto, Limited

CONFEDERATION LIFE BUILDING, TORONTO

BRANCH OFFICE:
IMPERIAL BUILDING, MONTREAL

The LUMBERMAN Weekly Edition is published every Wednesday, and the Monthly Edition on the 1st day of every month.

TERMS OF SUBSCRIPTION:

One Copy, Weekly and Monthly, One Year, in advance..... $1.00
One Copy, Weekly and Monthly, Six Months, in advance..... .50
Foreign Subscriptions, $2.00 a Year.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Special correspondents in localities of importance present an accurate report not only of prices and the condition of the market, but also of other matters specially interesting to our readers. But correspondence is not only welcome, but is invited from all who have any information to communicate or subjects to discuss relating to the trade or in anyway affecting it. Even when we may not be able to agree with the writers, we will give them a fair opportunity for free discussion as the best means of eliciting the truth. Any items of interest are particularly requested, for even if not of great importance individually they contribute to a fund of information from which general results are obtained.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

FOREST FIRES.

FIRE has again brought ruin to hundreds of miles of the forests of Canada. The most serious damage has been done in the Tamiscaming and Kippewa districts, in the northern pine sections of Ontario and Quebec. Although the actual loss is not yet known, the estimates range from $500,000 to $1,000,000. In New Brunswick and Nova Scotia the loss has been about $100,000.

The immediate monetary loss represents but a small portion of the damage, as millions of young pines which have no present value, but which, if allowed to grow, would in years to come be of immense value to the country, have been destroyed. The loss by the destruction of these young pines is more than the damage to the merchantable trees. They would have been commercially valuable in a few years, but it will be a long time before the new growth can replace them.

The larger trees damaged by the fire will be cut by the lumbermen as soon as possible. Perhaps it may follow that the timber output of the coming season will consequently be heavier than would otherwise have been the case, but it is hoped not to such an extent as to materially affect the lumber market.

In the opinion of Mr. Lumsden, a lumberman of many years' experience, the recent fires along the Ottawa river were caused by settlers burning brush in order to clean up the land. The Ontario Government has adopted a fire ranging system which gives the Department of Crown Lands authority to place rangers on territory under licence to lumbermen, and lumbermen themselves employ various measures to prevent the spread of fire. With all the precautions that are taken, it seems almost impossible to prevent an occasional fire getting such a start as to result in great damage.

It is manifestly in the interest of the country generally that liberal appropiations should be made by the Dominion and Provincial Governments to prevent the spread of forest fires and to educate settlers in the direction of lighting and controlling fires in or near a forest. We know of no investment from which equally good returns are likely to be secured as the appropriation of a liberal sum for the protection of the forests.

The sixth annual report of the chief fire warden of Minnesota contains information regarding forest fire-ranging which is very suggestive. The forests of that state are estimated to be worth one hundred million dollars. During the six years the fire ranging system has been in operation, the damage from forest fires has averaged only $35,000 a year, a comparatively trifling sum. It is even more remarkable that the entire expenditure for the system of protection was but $5,000 a year. No one would for a moment question the expediency of a system which, at an expense of $5,000, restricts the damage by fire in forests valued at $100,000,000 to $35,000 a year. The season of 1900 was the driest and most dangerous season that has occurred for six years. The number of forest fires reported was 139, which burned over 179,521 acres, and did damage to the amount of $153,399. Of the 139 fires 23 were caused by clearing land, 9 by railway locomotives, 13 by campers and hunters, 5 by burning meadows, 2 by river drivers, and 87 by unknown causes. It seems strange that the cause of so many fires should be unknown, but it is fair to assume that most of them were the result of carelessness on the part of settlers and hunters, rather than of accident.

The lumbermen who have suffered by the recent fires deserve the sympathy of the public. The loss in some cases represents more than the profits of an entire season's operations. Fire is but one of the many obstacles with which lumbermen have to contend.

THE COMING LOG CROP.

MOST of the lumbermen of Canada are now completing their arrangements for getting out anothers season's crop of logs. Prosperous conditions prevail throughout Canada. The harvest in Manitoba and the Territories is most abundant, while in the other provinces a fair yield of grain is assured. The lumber business, if we except the eastern spruce trade, is likewise prosperous. There is always the danger at times such as these of an over-production of lumber, and for this reason we would urge upon the lumbermen of Canada to adopt a conservative policy in respect to the quantity of logs to be taken out during the coming winter.

While pessimistic sentiment is not to be admired, it is very necessary to look carefully into the future and to so plan your business as to provide for reverses which arise from time time. The lumber business has enjoyed several years of good times, but as "in times of peace prepare for war," so it should be with the lumbermen as far as production is concerned. Very little can be lost by a manufacturer in restricting his production, as the timber if left on the stump will yearly increase in value; while if he should find himself with an over-supply of lumber in a time of depression, a financial loss is almost certain.

Canadian lumber manufacturers might very properly turn their attention and capital to the establishment of plants for manufacturing a greater quantity of their lumber into wooden specialties, many of which are in great demand at home and in Great Britain. The production of plants for the manufacture of box shooks, tool handles, mouldings, chair stock, and like goods will always find a ready market, the difficulty to a greater expansion of trade in these lines in the past being that it has been impossible for British importers to secure the goods.

The manner in which the British manufacturer utilizes every piece of raw material should be an object lesson to Canadians. A representative of an Irish firm which manufactures carriages recently visited Canada for the purpose of obtaining a supply of timber. To the writer he stated that such pieces of timber as were not suitable for carriage purposes were made up in tool handles, and those that would not make handles were cut up into chair stock, by which means every piece of timber of any size was utilized. He was looking into the question of carrying this policy of utilization still further, by putting in a machine for the manufacture of skewers.

The above suggestions are thrown out in the hope that Canadian lumbermen will not overstock the market with lumber, but will endeavor to restrict the output and obtain the best possible returns from the timber which is taken out.

LUMBER INSURANCE.

The Canadian Fire Underwriters' Association, at a meeting held in Toronto last month, decided to adopt specific rating, and in so doing made a sharp advance in the rates of insurance on lumber. This course, it is claimed by the underwriters, has been rendered necessary by reason of the heavy losses which the companies have sustained on lumber. The increase is equal to about one per cent. Although the new rate is only intended to apply immediately to the towns and villages of Ontario, it is understood that next spring the advance will go into effect throughout the Dominion.

While admitting that lumber is a more hazardous risk than other commodities, the lumbermen regard the advanced rate as excessive and unwarranted by the losses. While it is possible, by isolating the lumber from all buildings, to secure a comparatively low rate, many of the mills are so situated as to render this impracticable.

Commenting upon the action of the underwriters, the Insurance and Finance Journal says:—

"It is expected that the danger spots in a town will have to bear the brunt of any increases, and, on the other hand, risks or groups of risks, superior of their class, will have a favored consideration in rating. The object of this system of rating is to charge for insurance in proportion

to risk assumed. The following illustrations present the question in a popular light. The plan adopted in a certain class of stores of having all goods in a certain department priced at one figure, although of various values within a narrow limit, may work profitably on a small scale when the goods are of a cheap class, the best being worth only a few cents, but such a system would be utterly impracticable in dealing with more costly goods, which vary largely in value. For example, were an average price of 75 cents per yard fixed for goods in a dry goods store, some of which were worth 50 cents a yard and others $1 a yard, the sales would soon run so heavily on the dollar a yard articles as to make the business a record of losses. The only plan to carry on any business steadily with advantage is to sell each article proportionately to its cost, so that whatever line of goods is run upon by purchasers the result will be satisfactory. In fire insurance the range in the cost of different risks is exceedingly wide. There are properties that suffer very serious damage by a trifling fire, while others in order to be injured proportionately would have to endure a serious fire. It is certainly contrary to the very fundamental laws of business for an underwriter to charge the same rate for one class of risk as the other. There are also wide variations in the character of risks owing to their different location, though within the same municipal area. The risks in one street differ from those in another street ; even on the same street the chances of fire vary considerably. To charge a common rate for fire insurance within any large area, as a city or town, is to ignore these variations in the character of risks arising from their locality or their surroundings. To estimate the exact difference between one risk and another within a given area is a difficult task, as all the conditions affecting the risks cannot be thoroughly known. In fixing rates, averaging must be adopted to some extent, but the companies being desirous of establishing rates on a more scientific basis, a basis more equitable to themselves and to insurers of property, are moving towards a system of specific rating, the results of which, we trust, will be gratifying."

EDITORIAL NOTES.

It is reported, with what accuracy we cannot say, that the Canadian Northern Railway Company have restored the rate on lumber coming into Canada from Minnesota to 16 cents a hundred pounds, the probable result of which will be to lessen the quantity of United States lumber which will find a market in Manitoba and the Territories. While an advance in freight rates is not generally in the interest of the country, the present advance seems justifiable from the stand-point of equal rights, as there is no reason why United States lumber should be permitted to come into Canada free of duty, while the same privelige is not accorded to the Canadian product. Let the Dominion Government place a corresponding duty upon American lumber, and our manufacturers will have no fear of competition.

Where quality is placed subordinate to cost in a specification for lumber, it has often been the case that yellow pine has been employed in preference to white pine, as by means of the employment of cheap negro labor it has been possible to place yellow pine lumber on the market at a comparatively lower cost. It is of some concern to learn that the negroes of the south are now demanding higher wages, and that where the price for common negro labor a few years ago was ninety cents a day, it is now $1.50 a day. The question is proving somewhat perplexing to the southern lumbermen, who fear that if present conditions continue it may mean a loss of a portion of their trade. The demand for higher wages, however, seems only natural as the result of the greater development of the resources of the Southern States.

In a letter to the Department of Trade and Commerce, Mr. James Cummings, special trade commissioner to South Africa, after visiting all the business towns in the Colony of Natal, writes that he finds a general demand for goods that Canada could supply at a profit and better than the present arrangement from Great Britain and the United States. He points out what has been previously mentioned in these columns, that Canadian lumber, doors, furniture etc., is purchased there without the buyer having any knowledge that they are of Canadian manufacture. The mercantile classes of Natal will give the goods from Canada the preference over those from foreign countries, and in view of the wonderful development under way and in sight in South Africa, the business men of Canada should lose no time in endeavoring to secure as much of the trade as is possible.

The National Lumber Exporters' Association of the United States have undertaken a most difficult task, but one which if brought to a successful issue, is likely to result most advantageously to the lumber shippers of the United States, and eventually to those of Canada. It is to compel steamship companies to issue to exporters a clean bill of lading, or in other words a statement showing the exact quantity of lumber shipped, without the usual limiting clauses such as "more or less," "shipper's load and count," or others of similar import, also to deliver the goods in the same condition as when received. The Association, to accomplish its purpose, caused to be shipped two cars of lumber so prepared and tallied as to render proof of the quantity contained in them an easy matter, and upon their receipt by the steamship company demanded bills of lading setting forth the exact quantity contained in the shipment. This was refused by the steamship company, and suit was begun in the United States Division Court for the Southern District of New York to compel the delivery of such a bill. It is claimed that in the United States the loss resulting to lumbermen through inability to enforce delivery of the amount received, and in equally good condition, amounts to over $1,000,000 annually, for which loss there has been no redress. The suit will likely be bitterly opposed, but it is hoped that the Association may be successful in its effort, as the exisitng regulations are most unfair to the shipper. In another column will be found an acconnt of a suit brought to recover damage on account of short delivery of a quantity of lumber shipped from St. John, N.B., to Great Britain.

Some owners of steam plants and some engineers of the same believe that the feed water can not be supplied from the top, nor above the water line. The impression is prevalent that pressure is much greater in the steam space than it is in the water space. This error is very common, even among people otherwise well informed.

POINTS ON SAWING LUMBER.

A writer in the Mississippi Valley Lumberman says: "Speaking of sawing inch lumber as an investment, I do not entirely agree with many who seem to think that there is a chance to make a good deal of money even should prices maintain their relative positions. To begin with, it costs at least one-fourth more to saw inch lumber as compared with dimensions. While No. 2 boards and No. 1 dimension are supposed to be made of practically the same quality of stock, yet any one knows, who has had any experience in the saw mill business, that the boards will not hold up in grade as the saw mill will surely open out certain defects which in two inch lumber are covered up. Another factor which very few take into consideration, is that it takes more lumber to manufacture two one inch boards than one two inch board. Inch lumber is supposed to be sawed 15-16 of an inch thick, while two inch dimension is usually sawed 1 and 13-16 inches thick. The saw kerf takes out on an average about 1-8 of an inch for every cut that is made. It will therefore take 3-16 inches more lumber to manufacture two one inch boards than one two inch plank. There is good reasoo therefore in charging an additional price for the same quality of lumber where it is manufactured in the different thicknesses. In the past some of the lumbermen were in the habit of sawing their dimension practically plump thickness in order that they might re-saw it into boards should the demand make it necessary. That class of people have been very favorably situated the last few months. One manufacturer told me that he had been able to run his dimension through the re-saw for 15 cents per thousand."

PRACTICAL NOTES.

With the intention of counteracting the danger of the fire buckets being found empty when needed, either through evaporation or the water having been used for some other purpose and not replenished, the superintendent of a large mill devised the following plan: The hooks from which the buckets hung were fitted up with pieces of spring steel strong enough to lift them when nearly empty, but not sulficiently so to lift them when full. Just over each spring, in such a position as to be out of the way of the handle of the bucket, was set a metal point, connected with a wire from an open circuit electric battery. So long as the buckets were full, their weight, when hung on their hooks, kept the springs down, but, as soon as one was removed, or lost a considerable portion of its contents by evaporation or otherwise, the spring on its hook would rise, come in contact with the metal point, thus close the battery circuit, and ring a bell in the manager's office, at the same time showing on an annunciator where the trouble was. As the bell continued to ring until the weight of the delinquent bucket was restored, it was impossible to disregard the summons, and no further reason was found in that establishment to complain of the condition of the fire buckets.

Cleaning files.—A file, to do its work fast and well, should be kept free from its cuttings, says American Manufacturer. Cuttings "pin" when they lodge so finely that they cannot be removed with a brush. Pinning may be obviated by chalking the surface of the file, but this has the effect of reducing its bite. A little oil on the file will frequently reduce the tendency to pin. It should be used, however, only on the fibrous metals, as it glazes the surface of the non-fibrous metals, making them harder to cut. Chalk is usually applied to a file when a smooth, fine work surface is desired. The effect of the chalk is to prevent the teeth from cutting as freely as when it is not used, and thereby produces about the same result as would occur if a finer cut file had been used. When oil has been used on a file it can be readily removed by thoroughly chalking and brushing two or three times, as the chalk soaks up the oil and leaves a dry surface.

ECONOMY IN LUMBER MANUFACTURE.

Any one familiar with the saw mill business can call to mind case after case where two saw mills operating practically side by side and under identical circumstances show radically different results, says the American Lumberman. One is prosperous and evidently making money; the other is struggling for life. The result of one is wealth and of the other a mere existence, even if failure does not ensue. What is the cause of this difference in results? It is easy to say that it is a matter of ability. So it is, but that is hardly more satisfactory an answer than the description of all deaths as heart failure.

More than in most businesses the success of any lumbering operation rests in attention to little things. Two mill operators may have precisely the same start and the same continuing opportunities, with results in profit that will be measured by a difference of anywhere from $1 to $3 a thousand.

There are two mills each turning out about 40,000 feet of lumber a day. One has fifteen men on the mill floor, the other has thirty. Consequently the first cuts its lumber at a cost of 65 1-2 cents a thousand feet and the other at $1.31. One may effect a saving af 50 cents a thousand over its competitor in logging alone, while in the yard, dry-kilns, the planing mill, amounts proportionately as great may be made or lost.

There was once a saw mill in the south where thirty men took the logs from the skids in the woods and along the tracks, delivered them to the saw mill, put them through the saw mill, put the product through the dry-kiln and delivered it at the planing mill, at the rate of 60,000 or more feet a day. This was done not with expensive machinery, not with an elaborate provision of labor-saving appliances, but simply by an intelligent arrangement of the details with relation to the particular situation. A more modern mill might have saved two or three men or with the same number have increased the output. We venture to say that in this same general locality other mills were using 75 to 100 men to do the same work.

Take a complete lumbering operation, for example, such as one in the south which cuts its own timber, logs it by rail, finishes the product in the planing mill and distributes it in car load lots to the trade. How is a high degree of success secured?

In the first place the business is so organized that every man does the maximum amount of work, and works with the utmost effectiveness. In the next place the work in the woods is intelligently laid out so that no time is wasted. This is a matter of location of the logging railroad and of wheel roads from the stump to the tract. In a large operation steam loaders may be employed, but in a small one advantage is taken of the ground so as to make loading of the cars as easy and cheap as possible. If one man can do two or three things, two or three men are not employed to do them. On the other hand, if a man be most effective at one task he is not diverted by being called upon to lend his hand to another. The logging railroad is kept in repair so that there are no accidents or delays. There is a storage pond at the mill so that if by ill luck there should be a breakdown anywhere the mill will not have to close, remembering that it is not so much a big theoretical capacity as steady running that counts in the mill product, in both quantity and cost.

The mill itself will be of substantial construction with particular attention paid to the foundation of the principal machine and the lining up of the shafting. Given these conditions the machinery will be easily kept in repair, and it will be seen that they are so kept, for upon this point largely rest both the quantity and quality of the product. Miscut lumber means either a lower grade or an unknown amount of work in dressing it. Power will be ample. The boilers should furnish more steam than is nominally required by the engine and the engine should be rated above the nominal requirements of the machinery which it runs. A successful mill will not try to economize in the wages of the foreman, the engineer, the filer, the sawyer, the edgerman or the chief grader. Not only so, but all these men must work together harmoniously. There should be no cliques among the employes and no kickers. It is a mistake to suppose that the tale-bearer, the company spy, is a profitable member of the force, unless, indeed, it be that the entire force is made up of sluggards and soldierers, in which case blame lies with the management quite as much as with the men themselves. It is a mistake to suppose that in every case a machine is cheaper than a man. The ideal mill will stick to the happy medium. Some have too much machinery and too few men. Some have too much of both, while some might well substitute machinery for human muscle.

The grading platform is an important part of the mill. It should be ample and conveniently arranged on such a system that the product can be handled and distributed with the fewest men without confusion or delay. Here is a weak point in many a mill. In distributing to yard it would not be wise to say that either tram cars, push carts or wagons hauled by horses were absolutely the best—highly successful mills can be found that employ any one of them—but whatever the system employed it should be kept in easy working order, and the yard itself should be laid out intelligently as to grades and dimensions and to accommodate both piling and taking from pile.

The dry-kiln business is one by itself, requiring special knowledge and experience, but its arrangement in relation to the rest of the plant should be such as will be convenient and its equipment such as to require a minimum amount of labor.

The planing mill gives the finishing touches to the best part of the saw mill product and therefore largely fixes the value of the commodity. The machinery must be of good type, but above all must be well installed and maintained. Here, as in the saw mill, two or three first-class men can save the business from loss. And so we come to the office and selling department of the business. This is too large a subject to be even outlined here.

NON-INFLAMMABLE WOOD.

The degree of excellence to which the fireproofing of modern buildings has been carried, is evidenced by the severe tests which have recently been made in the United States and other countries with wood treated by the electric process of fireproofing. This process is the latest development in the science of rendering wood non-inflammable, and has been adopted by the British and United States naval authorities after a series of the most exhaustive comparative tests with every known method of fireproof construction in the line of material that could be utilized as wood in the building of warships. It has been endorsed by leading architects and chemists in this and other countries and has been used in some of the most modern buildings recently constructed.

When the lumber is received at the fireproofing works it is piled in conical shape on ron cars with 3-8 lath between each layer of boards. After the load has been made up 105 ft. long, it is drawn into a cylinder by a one inch cable, after which the door is closed and locked. Then a steaming process takes place inside the cylinder, thus opening the pores of the wood. The sap is extracted from the wood and drawn from the cylinder by vacuum. While this is taking place inside the cylinder the chemicals in the large tanks overhead are going through a heating process. After the lumber has been softened to a certain degree and the pores thoroughly opened, the heated chemical is allowed to pass by gravity into the cylinder until it is filled, after which the pressure pumps are set to work and are kept working until the pressure has gained 150 pounds to the square inch. The chemicals in the cylinder are then forced back into the overhead tanks by means of air pumps, the doors are opened and the lumber drawn out of the cylinder and transferred to dry-kilns, where the process is completed.

This electric process of fireproofing is at present carried on by three companies in the United States, one in London, Eng., and the Electric Fireproofing Company, of Canada, Limited, with office and works at Cote St. Paul, Montreal. A representative of the Canadian Architect and Builder recently visited the works of this company, which are situated at Cote St. Paul, on the Lachine Canal. The Grand Trunk Railway Company have siding into the premises, so that every lacility for shipping by water or rail is available. The property covers an area of 7 1-2 acres, and the factory is built of solid brick with roof supported on steel columns and girders. The building is divided up into a cylinder-room, engine and pumping room, boiler room, coal room, chemical-room, store-room, office, two dry kilns and transfer table. The building is so laid out that double the plant can be added as the business increases. The cylinder-room is 123 feet long by 32 feet wide, and contains two cylinders 105 feet long by 7 feet in diameter, capable of holding 15,000 feet B.M. of lumber each at one charge. Above the cylinders are three large feed tanks, each having a capacity of 26,330 gallons. The tanks contain the fireproofing solution, which is pumped into the cylinders under pressure. The doors of the cylinders are fastened by radial steel bolts weighing about ten tons, and are operated by two men in a few seconds; these doors have to stand at times an internal pressure of from 200 to 300 pounds per square inch. The boiler-room is 37 feet by 24 feet and contains two Babcock & Wilcox high pressure 75 horsepower boilers. These boilers supply steam to the cylinders, pumps, dry kilns, etc.

The engine-room is 39 feet by 37 feet, and contains a 75 horsepower Corliss engine; steam winch, 40 horsepower, for operating yard and lifting 8,000 pounds; one vacuum and pressure pump, 16x20x24 in.; duplex water pump, 8x7x12 in., connected to canal by an 8 inch water main; two duplex pressure pumps, 5 1-2x3 1-2x5 in., high pressure to cylinder; one pump for suction service to feed tanks, 5 1-2x3 1-2x5 ft.

The chemical mixing room is 37 feet by 34 feet, and a storeroom above of the same size. In this room is placed two setting tanks 12x8x6 in.; directly above is one circular tank, 5 feet diameter by 3 feet 6 inches deep, used for mixing the chemicals; two dry kilns two-storey high, 123 feet by 16 feet 6 inches wide, each heated by the "Common-Sense" system of radiation. The lower storey is filled with the lumber, placed on cars, and is fed by a fan 110 inches in diameter, connected to a condenser, 21x5 ft. 2 in. x 4 ft. 6 in. high; this condenser is filled with cold water radiators, which purify the air as it passes through same into heater 12 ft. 3 in. x 5 ft., 2x7 ft. 2 in. high; this heater contains 8,000 feet of 1 inch steam pipe, which heats the air to a given temperature, after wh ch it is blown into the dry kiln at the extreme end and sucked out at the rear end by means of the fan, which makes a continuous circulation of air. Above the dry kilns is a room for storage of lumber, 125 feet by 33 feet. The office is 32 feet by 48 feet, and includes a test-room, in which the chemicals and solutions are tested for strength and impurities. A traverse table 35 feet wide by 10 feet traverses 137 feet and is worked by a steam winch. It is used for transferring the cars of lumber from the yard to the cylinder and from there to the dry kilns, this giving access to all tracks in the yard. The railway track from the Grand Trunk Railway enters the grounds about midway and passes through the centre of the building, connecting with the various rooms, so that the least amount of handling of lumber is avoided, ensuring economy and the smallest amount of damage to the material.

CANADA LUMBERMAN

WEEKLY EDITION

The Lumberman Monthly Edition, 20 pages } $1.00 PER YEAR { The Lumberman Weekly Edition, every Wednesday

THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN, THE UNITED STATES, AND OTHER FOREIGN MARKETS.

VOL. VII. TORONTO, ONT., AUGUST 7, 1901 No. 28

CANADA LUMBERMAN

PUBLISHED BY

The G. H. Mortimer Publishing Co'y of Toronto, Limited

Confederation Life Building - TORONTO.

Branch Office:
IMPERIAL BUILDING, MONTREAL.

Weekly Lumberman, published every Wednesday Contains reliable and up-to-date market conditions and tendencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canaian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

WANTED AND FOR SALE

FOR SALE.

About 3½ million feet of White Pine, mill runs ½ million feet dry; cut last August. Address,
W. G. DOHERTY, Day Mills, Algoma, Ont.
or
W. DOHERTY & CO., Clinton, Ont.

WANTED.

POSITION BY EXPERIENCED HARDWOOD lumber inspector. For reference as to ability, etc., apply to "C. D," office of CANADA LUMBERMAN, Toronto, Ont.

FOR SALE

SAW AND PLANING MILL FOR SALE. Good locality, going concern. Good reasons for selling. Apply Box 56, CANADA LUMBERMAN.

SLABS, SLABS.

FOR SALE, OUR SEASON S CUT OF PINE Slabs. A quantity ready for present shipment Please send tenders. HUNTSVILLE LUMBER COMPANY, Limited, Huntsville, Ont.

For Sale

CHAIR STOCK WANTED

Wanted for export in car load lots, Sawn Chair Bottoms 14 to 15 inches square by 1¼ inches thick; birch or other suitable wood. Reply to Box 32 CANADA LUMBERMAN.

CURRENT TRADE CONDITIONS

ONTARIO.

A Toronto dealer who recently visited Georgian Bay points states that there is much activity in the shipping of lumber. Considerable stock sold some time ago is yet at the mills, but it is being cleared out as speedily as possible to make room for the new cut. The number of inquiries received for stock shows no falling off, and it is expected that a brisk fall trade will be experienced. Larger shipments than usual have been made to Chicago this season, and Michigan dealers have bought quite liberally on account of the decreased supply in that state. Log run white pine on the Georgian Bay brings from $17 to $18. Norway pine is meeting with a good demand, and recent sales have been at satisfactory figures. Local trade throughout the province is a little quiet, the demand from retailers having declined on account of a falling off in the prospective grain crop. In Toronto building lumber is being called for moderately, but retailers report less activity than earlier in the season. The outlook for hardwoods is still uncertain, although manufacturers appear to have every confidence that the demand will improve and that the present prices will be maintained. It is reported that the combine of furniture manufacturers is making a strong effort to depress hardwood prices in the hope of buying at rock-bottom figures.

QUEBEC AND NEW BRUNSWICK.

The shipments of lumber from the St. Lawrence to the United Kingdom during the month of July were comparatively light. Notwithstanding that the low freights are an incentive to send goods forward, it is expected that the exports from now until the close of the season will be limited, as shippers recognize the necessity of giving the British market an opportunity to recover. A few vessels have been chartered for September and October loading at 45 shillings, to Liverpool and London. Quebec spruce deals are a little stronger. A higher market for spruce is expected in the Eastern States this fall. Clapboards are selling quite freely, as is also cedar shingles, but very few sales of the latter have as yet been made above $2.90, on Boston rate of freight, although $3 is generally predicted by the leading manufacturers. Fully twenty million feet of logs are hung up on the St. John river, and cannot be moved before the fall rains, and perhaps not until next spring.

UNITED STATES.

The only conclusion that can be reached from a summary of reports is that the white pine trade of the United States is in a most prosperous condition. Not for many years has the stock of unsold lumber in the Lake Superior district been so small. At Ashland, Wis., the stock of unsold Norway and white pine is but 30,000,000 feet, as compared with 75,000,000 feet at the same time last year. Most of the large mills have contracted for the bulk of their season's cut, Chicago parties having been heavy buyers of late. No. 4 boards are now selling in Duluth at $10.00, short Norway at $10.75, and 6-inch strips at $15.50. The lath market is strong, No. 1 white pine bringing $2.75, and No. 1 Norway $2.10 to $2.25. In the Saginaw valley white pine is moving freely and prices are stiffening, as stocks are somewhat broken. Log run is held at $18 to to $22, box at $15 to $16, and mill culls at $12. The eastern wholesale markets are not as active as they have been, but dealers have enough orders ahead to keep them busy for several weeks. Notwithstanding large receipts, there is still a scarcity of fine common and better at Tonawanda and Buffalo. Prices generally are firm, with the exception of box lumber, which is unsettled. Some dealers are reported to be offering this class of lumber at a reduction of $1 per thousand from late quotations. Such action is believed to be unwarranted, and other dealers have refused to meet the cut and will hold their stock until they can get what they regard as a fair price. The spruce trade is not active, but recent inquiries have developed a scarcity in certain sizes in the hands of New York and Boston dealers. Spruce lath is in good demand. The tone of the hardwood market is stronger. Inquiries are becoming more numerous, which leads to the conclusion that a brisk fall trade will develop. Some dealers report a good trade in birch.

GREAT BRITAIN.

The feeling in British timber circles is a little more hopeful. An average consumption is gradually reducing the heavy stock of lumber, and if shippers do not send forward heavy consignments in the autumn, a partial recovery of prices is confidently looked for. While the London market has not been relieved to any extent and still rules weak, an advance in the price of spruce at Liverpool has brightened the outlook there. During the last two weeks spruce deals have developed a stiffening tendency, and prices, we are advised, have advanced five shillings per standard. A Miramichi cargo has been sold to a Lancashire port at £6 10s per standard c.i.f., and brokers are asking £6 5s for inferior specifications. Holders of spruce seem to have great confidence in the future of that lumber. While the import of pine deals has been comparatively light, prices show little tendency to advance, but this may be explained by the fact that pine prices did not decline during the late period of depression to the same extent as spruce. The lower grades of Canadian lumber generally are in heavy stock and sluggish. Square timber is selling moderately at prices which vary but little from quotations of one month ago. Birch planks are in heavy stock and values have declined. The sale is reported from Liverpool of a large quantity at £5 10s per standard, a price which is almost certain to result in a loss to the shipper. At auction sales in London last week Quebec 3rd white spruce was sold at £6 10s, Miramichi 3x11 1st, 2nd and 3rd white spruce, averaging seconds, £7 10s; 3x9 same price; 3x7 a little better than £6 10s. Montreal 1st bright white pine (dry) for a mixed parcel of 3x10 and 11 to 3x4 sold at £12 5s; a parcel of seconds of better assortment, £15; and thirds, 3x11, same grade, £11 5s.

FIRES

The saw mill of Howes & Leighton at Harriston, Ont., was completely destroyed by fire last week.

STOCKS AND PRICES

The barge Seguin last week loaded 900,000 feet of lumber at Victoria Harbor, Ont., for Chicago.

The city clerk of Montreal is asking for tenders up to August 13th for annual supply of lumber for waterworks purposes.

William Richards, of Boiestown, N. B., has received an order from England for several million feet of maple lumber for furniture stock.

During the six months ended June 30th, 1901, 2,766 car loads of deals were shipped from Halifax, N.S., to trans-Atlantic ports.

The cargo of the steamer Teutonia, which sailed from Montreal for Hamburg last week, included 100,000 feet of lumber and 30 standards of timber.

The Saginaw Lumber & Salt Co., of Saginaw, Mich., is reported to have sold recently 3,000,000 feet of log run lumber at a high figure, the stock to be cut from Canadian logs.

The steamer Daventry is loading a cargo of deals and timber at Quebec for Newcastle, consigned by Sharples & Co. The steamer Gladestry is loading a cargo for the United Kingdom.

It is reported that Demase Parizeau, timber merchant, of Montreal, has received an order from a firm in Bordeaux, France, for 750,000 box shooks, the result of samples of Canadian woods distributed by Mr. Parizeau a short time ago.

The steamer Lake Ontario sailed from Montreal last week for Liverpool, her cargo including 500 standards of deals. The Europa sailed for London with 500 standards of deals and took on 175 standards more at Quebec. The Ramore Head sailed for Dublin with 230 standards of deals and a quantity of timber.

The following prices were realized at a late sale held at Dublin by the Dublin Timber Co.:—Quebec spruce, 3rd quality, 13ft. 6x3, £10 15s per Irish standard; 11ft. 8x3, £12 5s; 12ft. and 13ft. 8x3, £12 10s; 12ft. 9x3, £12 17s 6d, £12 15s, £12 10s; 13ft. 9x3, £12 12s 6d, £12 15s, £12 17s 6d. Unsorted, 12ft. 9x2, £12 10s; 12ft. 9x1 1-2, £11 5s; 16ft. 9x1 1-2, £12 10s, £12 15s. Miramichi spruce, ex. "Corderillera," 14ft. 7x3, £12 2s 6d; 13ft. and 14ft. 9x3, £12 17s 6d; 14ft. and 15ft. 9x3, £12 15s; 15ft. 9x3, £12 12s 6d; 16ft. and 18ft. 9x3, £12 15s; 9ft. to 11ft. 11x3, £12 15s. 1st Quebec pine deals, 12ft. to 15ft. 12in. to 15in. x 1 1-2 in., £40; 12ft. to 16ft. 13in. to 15in. x 3, £45.

Concerning the market in England for spruce deals, the Timber Trades Journal says: "Buyers on this side have a large stock to work upon, and until this is further reduced the lowering tendency of spot goods may be expected to continue. Offers, however, sent out to Quebec for 3x9 2nds, at £8 15s, c.i.f., have been declined, and sellers out there are afraid that, in this size, they will not have enough to complete the contracts already in hand. Regarding lower port spruce stocks, we understand that from some of the outports the entire shipments are completed, and the shipments from St. John are expected to be very much less than last year. The total shipments from the lower ports to the end of June were about 7,000,000 feet less than last year, and during July and August, 1900, about 90,000,000 superficial feet were shipped; but the belief is pretty general that this year's shipments, extending over the period named, will be considerably less. A Cape Hopewell cargo of rather a bad specification, containing a large percentage of 7 and 8 in., has been sold this week to Liverpool at £6 2s 6d. This represents a slight market advance. As the Liverpool importers are among the keenest buyers of spruce, the sale is not without its significance. After the low prices which have been lately accepted, some reaction appears possible."

CANADIAN LUMBER SHIPMENTS.

The following shipments of lumber, etc., from Canadian ports are reported since last issue:

From Buctouche, N.B.: Schrs Melatus, Bell, L. P. Churchill, Ocean Bride, Richard B., and Beatrice May, for Cape Breton and Prince Edward Island points, total value of cargo $2,700.

From Sackville, N.B.: Str. Petunia, for Manchester, Eng., 1,271,279 ft. deals and battens, value $11,411,284; 894 ft. scantling, value $1,995; 64,420 ft. ends, value $395; 22,766 ft. boards, value $115, by P. G. Mahoney. Schr. Two Sisters, for United States, 108,000 scantling, 50,000 laths, value $927, by John M. Hicks.

From Vancouver, B. C.: Tug St. Clair, for United States, 272,644 ft. for Japan, 262,168 ft. rough fir, value $1,516, by T. Larkin. Str. Athenian, for Japan, 262,168 ft. rough fir, value $4,016, by British Columbia Mills, Timber & Trading Co.; 200,600 ft. rough fir, value $1,602, by Robert Ward & Co. Tug Vulcan, for United States, 400,000 ft. cedar logs, value $2,000, by Hamilton Logging Co. Schr. Angora, for Australia, 5,976 ft. rough fir, value $597, by North Pacific Lumber Co.; 49,863 ft. dressed fir, value $2,000, by B. C. Mills, Timber & Trading Co.

From Montreal, Que.: Str. Tritonia, for Glasgow, 1,304 pcs. deals, etc.,

SUIT REGARDING SHORTACE OF LUMBER.

The Timber Trades Journal gives the following account of a decision of the British Courts which is of interest to Canadian shippers :

On Saturday last, in the King's Bench Division of the High Court of Justice, the case of the Mediterranean and New York Steamship Company—which was tried at Liverpool in February last before Mr. Justice Bucknill and a special jury—came again before his lordship for further consideration.

This was an action brought by the plaintiffs, a Liverpool shipping firm, to recover from the defendants, A. F. & D. Mackay, of 10 Canada Dock, Liverpool, the sum of £175 15s 3d, balance of freight on a cargo of timber shipped per the "Pocahontas," from St. John, New Brunswick, to Liverpool. The net freight amounted to £1,925 15s 3d, towards which the defendant firm had paid £1,750, and they claimed to be entitled to retain the balance against alleged short delivery of goods. It appeared that the charter party provided for the payment of freight on intake measurement on the quantity of timber delivered, as ascertained at the port of delivery. The special jury at Liverpool found that there had been a difference between the quantity shipped, as shown by the bills of lading and that delivered, and the case was adjourned to London in reference to the principle by which the question of shortage should be decided.

His lordship, in giving judgment, said he must find for the defendants. There were two questions for his consideration. The first one was a question of freight, and the second was that of the counter-claim, and in his opinion the defendants were entitled to judgment upon both. It seemed to him that the real answer to the claim was that the shipowner had chosen to sign a bill of lading, the accuracy of which he might, if he had liked, have ascertained. But the shipowner had not verified the bill of lading, which comprised four classes of timber. Having signed the bill of lading the shipowner undertook by the charter party, that the bill of lading should be conclusive evidence as establishing the quantity delivered him something less than the quantity delivered. The freight was payable on the intake measurement of the quantity delivered as ascertained at the port of discharge. When the vessel arrived at the port of discharge the consignee had to ascertain what timber of each particular class had been delivered to him. And he found that of one of these classes there were 1,215 pieces short, which entitled him to say to the shipowner that the latter had in that class, delivered him something ,est than the quant ty which the shipowner had admitted having received according to the bill of lading. His lordship thought the proper way to ascertain the freight was to ascertain what was the amount of each particular class of goods delivered, and to calculate the rate of freight on the shortage, if any, on any particular class of the timber. That was what had been done here. The exact figure payable to the shipowner for freight could be ascertained. With regard to the counter-claim, the consignee was entitled to say to the shipowner that he had received so many pieces of timber of a certain sort, valued at a certain price, but that something short of the proper quantity had been delivered, and the counter-claim was for that amount. It was clear, his lordship thought, for the reasons he had stated, that the defendants were entitled to recover upon the claim and counter-claim.—London Timber Trades Journal.

AMERICAN FORESTRY ASSOCIATION.

The special summer meeting of the American Forestry Association will be held at Denver, Col., on August 27th to 29th, inclusive. There will be two sessions daily, the proceedings of which will be of special interest to all concerned with forest problems. There will be presented a number of valuable papers, including one by Mr. Gifford Pinchot, Government Forester, of Washington, D.C.

PERSEVERANCE BRINGS SUCCESS.

As incessant drops of water,
With persistent, tiny blows,
Beat down the rugged mountains
And dissolve the deepest snows ;

As when thread to thread is added,
Larger still the fabric grows,
And the most persistent knitter
Wears the longest, warmest hose ;

As the dog by dogged gnawing
Tastes the marrow of the bone,
And repeated mallet-tapping
Brings the statue from the stone ;

As the most untiring printer,
With incessant "click, click, click,"
Marches largest verbal armies
By divisions o'er his stick ;

As letters to letters added
Makes complete the longest page,
And minutes oft recounted ...
Tell the sum of longest age ;

As oft-gained bits of wisdom
Make the store of knowledge great,
And man after man enlisted
Fills the armies of the state ;

As rivulet after rivulet
Swells the river o'er its banks, ...
And continued penny savings,
Aggregate the wealth of banks

So the constant advertiser,
By a law of common sense,
Builds his business enterprises
Into volumes most immense.

ELECTRIC POWER FOR SAW MILLS.

Taking up the question of the advisability of adopting electric power for saw mills, a writer in the Timber Trades Journal says :

There can be no doubt but that the adoption of electric driving of a saw mill effects a considerable economy over steam engine driving through shafting, whether the electric current is obtained from a central supply station or has to be generated on the mill premises. The most recent and weighty report yet issued upon the question as to the relative advantages of steam engine one two inch plank. There is good reason theretrical transmission was that issued by the Master Mechanics' Association of America a few months back. In this report they pointed out that where there are a number of separate shops, the fact that all the shops can be readily supplied with power from one centre and without the intervention of great lengths of shafting, the fuel saving may readily be 33 per cent., and that even when all the machines are collected together in one shop, the individual tool method, i.e., a separate motor for each machine over three-horse power, is more economical than shafting transmission.

The gain to be effected by electrical driving depends in a great measure on whether the machines are continuously at work or whether some of them are liable to stand idle for varying lengths of time, for in the latter case the shafting is continuously absorbing the same power, despite the fact that no work is being done. It is a matter of frequent occurrence that the shafting alone absorbs from 30 per cent. to 50 per cent., and even up to 70 per cent., occasionally of the total power developed, whereas with electrical transmission, allowing for all losses in the motors, mains and generator, the total losses at full load should not be so great as 20 per cent., and when working at, say, 1-2 to 3-4 load, not more than 25 per cent. If now we take into consideration the fact that the electrical energy consumed is in direct proportion to the work done by the motors, whereas with shaft transmission the energy consumed by the shafting is constant independently of the load, we find that the electrical transmission must of necessity effect a considerable saving.

As regards convenience and shop output it is evident that with shaft transmission the arrangement of the machines in the shop is necessarily such as to allow of the shafting and engine connection being as simple as possible without regard to the best methods of handling the work. Electric transmission, on the other hand, presents no restrictions on the placing of the tools, and consequently the arrangements are planned with a view to the least possible waste of labor. Again, should extensions be required, no account need be taken of the present arrangements, as the new machines may be put down in any convenient position without regard to any line of shafting.

The trouble arising from the use of electric motors is now practically nil, as they can be obtained either perfectly water and airtight, or what is known as the "ventilated enclosed" type, these latter being as reliable as the totally enclosed, and considerably cheaper.

The actual horse-power required to drive the various classes of machines varies very considerably, depending upon whether the wood is dry or damp, on the state of the saws and cutters, etc., and upon the skill of the workman.

The following figures may be taken as approximately correct as the average power required:—

Circular saws	20in. to 37in. dia.	12/15 h.p.
" "	36in. by 48in. "	15/20 "
Frame saw	30in. to 18in. "	20/25 "
" "	18in. by 6in. "	15/20 "
Planer	12in. by 14in. "	12/15 "
"	12in. yellow pine, top only	10/12 "
"	6in. oak flooring, top and two sides	30/35 "
Daniel 30in. head planer, cutting 3-16ths off top		9/10 "
Moulding, 6½in. yellow plne, 4 sides		9/10 "
Tennoning, oak end sills, 3¾in. × 5in. × 10in. cut		7/8 "
Three spindle boring mill, oak 2in. bits		2/3 "

It is advisable always to provide adequate power; indeed, rather to put in motors of rather larger than smaller power than is actually required for this class of work, as frequently much greater horse power than those given above are momentarily demanded by the work, and although a motor is capable for a short period of developing three times its rated power, yet a more constant speed, less frequent interruption of the work, and better regulation of the pressure of supply is obtained if ample power is provided. Contractors under the stress of competition are liable to quote for motors barely capable of doing the work demanded of them, with resulting unsatisfactory working of the plant.

The motors should always be protected by means of automatic circuit breakers, to save them being burnt out in the event of any sudden overload pulling them up, and for cutting them out of circuit should the supply of current be temporarily suspended. If so protected modern motors of good design, and if made by firms of good standing, require no skilled attendance whatever.

SANITARY REGULATIONS.

The Provincial Health Officer, acting under instructions from the Provincial Secretary, has issued in pamphlet form the regulations adopted by the Provincial Board of Health, under the authority of the act passes last session, respecting sanitary regulations in unorganized territories. The owner, manager, agent or foreman of any lumbering or mining camp, saw mill, smelting works or other industry or of any railway construction camp, located in an unorganized district, is made responsible for carrying out the the regulations. Provision is made for proper ventilation of dwelling houses occupird by the employees, and for the erection of a hospital building, or, in lieu thereof, a properly equipped double-walled tent, with all facilities for heating and ventilation, must be kept on hand in case of necessity. The pamphlet is being sent to all mill owners in unorganized districts and others who come under the regulations.

SAW vs. PULP MILL.

That the saw mill and the pulp mill cannot live in peace on the same river is daily becoming more apparent—at least in eastern territory—as is instanced particularly in the last season's log drives in Maine. While it is true that drives may be late in any year from natural and unavoidable causes, it is also true that much of the delay lately experienced in Maine has been caused by the holding up of drives at sorting gaps in order that pulp logs may be sorted out from the others. This process of sorting out delayed the East branch drive seventeen days this year, and at last advices there was no telling how long it would take to sort the pulp logs from the West branch drive. There is apparently no remedy for this, because with the pulp men buying logs from many different operators, located at widely separated points along the lumbering waters, the various lots of logs purchased must necessarily be mixed all through the drives when the logs are started down the rivers in the spring. It seems to be a question as to which will survive—the pulp mill or the saw mill—and as the pulp men are the richer and their business the more profitable, it is the belief of many that, except where favored by exceptional advantages, the saw mills must soon disappear.

This prospect is regarded variously by the people of Maine. Some say that if the pulp men are the more prosperous and can pay higher prices for logs than can the lumbermen it is not only logical but desirable that the pulp mills should survive and the saw mills go. Others declare tha the pu,p mills, while of great temporary benefit to certain timber land owners of whom they buy supplies, will ultimately bring disaster upon Maine, by denuding the state of its forests, which eighty years of lumbering has not done.

United States Senator Eugene Hale, in a speech at Skowhegan in 1891, said: "In forty years the forest lands of Maine will be as bare of good timber as is this platform upon which I stand." At that time there were few pulp mills in Maine, but ever since those log-eating establishments have been mu,tip,ying, until to-day there is warfare between the pulp and lumbering interests as to which shall control the rivers of the state. Calvin Moore, a prominent lumberman of Somerset county, Maine, who has for many years operated upon the head waters of the Kennebec, says:

There is no use denying the facts. The time is near at hand when lumber for the outside market will not be available in this state. It is a fact that the pulp mills have eaten into the very vitals of the lumber business. They are creeping coward the tree, where once the tree was floated to the mills. It is a common thing and has been for a number of years for pulp mill managers to purchase of lumber operators logs that the pulp managers had not time to cut on their own holdings. The Hollingsworth & Whitney Company, with mills at Winslow and Gardiner, cut more than 20,000,000 feet of logs last winter and purchased large quantities.

Fifteen years ago the ordinary lumber operator cut from 1,000,000 to 2,000,000 feet of logs in a winter. It was then understood that the operator would be twenty years in cutting over a township and that he could then go over the same land again, beginning where he had cut the first lot, and get just as good logs as before. As a rule, this is true. Whatever pine the operator passed by on his first cutting over, on account of its being too small, would, when he made his second trip, have grown to good size; but when he had cut that down he was out of pine, for where a pine is cut a spruce growth follows.

Now, when a single corporation cuts 20,000,000 feet in one winter we can easily see how long it will be before a township becomes entirely stripped of its spruce. In a short time the great timber section will be an expanse of stunted growth fit for no purpose except to shelter game, and the lumber operator will have to go to Canada for his logs.—American Lumberman. ...

LARGE TIMBER CONTRACT.

Mr. F. Clergue, of Sault Ste. Marie, Ont., has signed a contract with Mr. H. R. McLellan, of St. John, N.B., which is the largest of its kind ever entered into in America, and means that Mr. McLellan has undertaken to cut and skid 300 cords of hardwood per day for two years. This wood is to be used for the purpose of making charcoal for the steel plant at the "Soo," and at the same time the bye products will be extracted and utilized for commercial purposes by the largest carbonization plant in the world.

Speaking of the contract, Mr. McLellan said: "Mr. Clergue's carbonization plant is by far the largest of its kind in the world, and 300 cords of wood per day is only half the quantity that Mr. Clergue's works will really have the capacity to consume. His plant is to be constructed for the consumption of 600 cords per day. While I appreciate the fact that this is a vey large contract, I am satisfied to enter into it after seeing the immense quantities of hardwood that are lying along the Algoma Central Railway. I do not think there is any doubt about Mr. Clergue being able to supply his carbonization plant for a great many years to come. I only went out on the railway for a distance of thirty miles and in that distance I saw sufficient hardwood to supply 600 cords per day for ten years at least. The wood is all to be got on Mr. Clergue's own land. I shall bring my own men from Northern Maine and New Brunswick to cut and handle the timber, and I intend to be on the ground about the 15th of August. In addition to using horses for yarding and hauling I will use steam skidders and lidgerwood cableways for procuring this wood. This carbonization plant is, I may explain, an auxiliary of Mr. Clergue's great steel works, but at the same time he saves the bye products."

ONE WAY OF DIVIDING TRADE.

The Mississippi Valley Lumberman contains an interesting article reprinted below, in which is reflected a series of incidents peculiarly true to real life.

A good many lumbermen declare that it is impossible to successfully carry on a retail lumber business without having some kind of an understanding or agreement between all of the competing dealers. Many different methods have been tried, but there has been found some drawback to each. Where a uniform price list is ageeed upon the customers and particularly the farmers very soon come to the conclusion that there is some combination between the lumbermen to extort excessive profits, and accordingly they will go many miles to make sure there is active competition for their trade. The dividing of the business with reference to the total number of cars is often apt to give one dealer a great deal of advantage over the other. The quality and character of material sold varies so largely in price that this plan is not often a very equitable one to follow. One of the most general practices is to divide up the different customers in acrordance with the first letter in their name. Each retailer, in case there were two, would then have one-half of the 26 letters of the alphabet, representing parties whom they would consider their particular customers. By this plan, however, a good many sharp buyers soon discover that there is some scheme whereby they are compelled to purchase from but one dealer, and naturally they are inclined to make trouble. Some dealers have tried the experiment of figuring together each bill as it came up, allowing the different dealers to take them in rotation. The objection to this method is that it necessitates frequent conferences between the lumbermen, and the public becoming familiar with this practice, concludes that there is a combination,and accordingly is suspicious and discontented. I had a talk the other day with a retailer who seems to have devised a very equitable and satisfactory plan for dividing up the trade of his village. There are but two dealers at this point, and once a month they get together. Twenty-six small cards are provided and on each is printed one of the letters of the alphabet. These cards are placed in a hat and shaken up and each dealer alternately draws one out. The thirteen cards which the dealer has then represents the first letter in the name of the parties in the neighborhood who will be his customers for the month. A list price is agreed upon which each dealer will maintain when asked for prices by any customer that belongs to the competitor. The party who sells the bill has the privilege of cutting the price list up to five per cent. The next month the same lottery drawing is gone through with. By this plan the customers are kept guessing and it gives also the semblance of a very active competition between the local dealers.

LUMBERMEN'S SUPPLIES.

Attention is directed to the page advertisement of Lewis Bros. & Company, which appears in this issue. Every lumberman knows that the success of his business depends to a great extent on the quality of the tools he employs, and Messrs. Lewis Bros. & Company have established a reputation for handling the most reliable and modern tools for all branches of the lumbering business.

The firm is well known as one of the largest dealers in lumbermen's tupplies in Canada. They are sole agents for Hurd's celebrated axes, including Hurd's Michigan, Dayton and Wedge Pattern razor blade axes; Hurd's razor blade scoring axes; Hurd's Michigan pattern double bit, and Hurd's 707 hand-made double bit, and others. They also represent Messrs. Henry Disston & Sons, the leading saw makers of the United States, and Shurley & Dietrich, Maple Leaf Saw Works, of Galt, and supply peaveys, cant hooks, boom chains, skidding tongs, Swede's iron piling hooks, etc.

Mail orders received by Messrs. Lewis Bros. & Company are given prompt and careful attention, goods being shipped the same day as the order is received. It is largely owing to this careful attention to detail, as well as to the reliability of their goods, that this firm has succeeded in building up the immense patronage it now enjoys.

HOW CIRCULAR SAWS ARE MADE.

Circular saws are now made of cast steel specially manufactured for the purpose. An ingot heated to the requisite temperature is reduced to the proper thickness in powerful rolls. The plate is then centred and a circle scribed upon it, after which it is passed to the shearer, who reduces it to a circular form. The centre hole is then bored. It is then handed to the toother, who punches out the teeth around the edge, after which it is rough-filed or ground on an emery wheel to take off the burr left by punching. The rough saw is now again heated in a large furnace until it is of a bright red color. It is then plunged into a bath of sperm oil, which makes it hard and brittle. The oil is then partly cleaned off, and the rest burned off in a furnace to give the saw the required temper. When cold, the saw is hammered on a steel-faced anvil until it is quite straight. It is next ground between vertical grindstones revolving in opposite direrions, and then polished with emery on a large disc. Once more the hammermen take it, and strike it with smooth-faced hammers on an anvil as before, until it is absolutely straight and true, and has aquired the proper tension, which allows for expansion while the saw is revolving at work. The teeth are now set alternately right and left to allow for clearances when sawing timber. They are then sharpened by being filed on the front and tops of the teeth, which operation completes the manufacture.—Invention.

MEETING OF PACIFIC COAST LUMBERMEN.

The monthly meeting of the Pacific Coast Lumber Manufacturers' Association was held at Vancouver, B.C., on June 27th. This is the first time a meeting of this character has been held in British Columbia, and will be the means of bringing the lumbermen of the two countries closer together.

The following British Columbia mill men were present: John Hendry, R. H. Alexander and C. M. Beecher, of the B. C. Mills, Timber & Trading Co., Vancouver; J. G. Woods, of the Moodyville Lands & Saw Mill Co., Moodyville; E. J. Palmer, of the Victoria Lumber & Manufacturing Co., Chemainus; Andrew Haslam, of Nanaimo; R. C. Ferguson, of the Royal City Mills, New Westminster; J. W. Hackett and J. Robertson, of Hackett & Robertson, Vancouver; J. G. Scott, of the Pacific Coast Lumber Co., New Westminster; W. H. Lewis, of the Brunette Saw Mill Co., New Westminster; J. C. MacClure, of Robt. Ward & Co., Vancouver; E. H. Heaps, of E. H. Heaps & Co., Vancouver; H. H. Spicer, of the Spicer Shingle Co., Vancouver; H. Rowe, of the Canadian Pacific Lumber Co., Port Moody; H. De Pencier, of the North Pacific Lumber Co., Barnet.

The British Columbia Mills, Timber & Trading Co., of Vancouver, and the Moodyville Lands & Saw Mill Co., of Moodyville, were elected members of the association.

It was decided to make two classes of membership—one for the rail and the other for the cargo trade.

The report of the rate committee was heard and other matters discussed. The cargo committee also made a report, and trade conditions were gone over.

In the evening a splendid banquet at the Hotel Vancouver was tendered the visiting lumbermen by the British Columbia mill men, and toasts were offered and speeches made until 10 o'clock, when the Washington delegation repaired to the steamer Mainlander for the return home.

The big plant of the British Columbia Mills, Timber & Trading Co was visited. The Washington lumbermen were pleasantly surprised at the quantity of lumber turned out, the up-to-date equipment of the plant and the good workmanship. After the meeting, in the forenoon, a visit was paid to E. H. Heaps & Co.'s shingle plant, and also the plant of the Hastings Shingle Manufacturing Co.

LUMBERMEN TO ENTERTAIN ROYALTY.

The following have been appointed a committee of the lumbermen of the Ottawa Valley for the purpose of providing Their Royal Highnesses, the Duke and Duchess of York, with a suitable trip from Britannia to some point above the Chaudiere Falls down the square timber slide channel on the occasion of their approaching visit to Ottawa: Wm. Anderson, Ottawa; F. W. Avery, Ottawa; A. Barnet, Renfrew; Samuel Bingham, R. M. Beckett, C. Jackson Booth, J. R. Booth, L. Blackburn, E. H. Bronson, F. P. Bronson, J. C. Browne, Ottawa; George Bryson, Fort Coulonge; James Carswell, Renfrew; Robert Conroy, Aylmer; Robt. M. Cox, Levi Crannell, Hon. R. R. Dobell, Ottawa; E. B. Eddy, Hull; W. C. Edwards, M.P., Rockland; H. K. Egan, Ottawa; John Ferguson, Admaston; Allan Francis, Renfrew; Alex. Fraser, J. B. Fraser, Gillies Bros., Braeside; Gillies, J. and A., Arnprior; George Gordon, Pembroke; Allan Gilmour, John Gilmour, G. B. Greene, Ward Hughson, Robt. Hurdman, Ottawa; James B. Klock, Klock's Mills; Alex. Lumsden, C. A. McCool, M.P., David MacLaren, Ottawa; Claude McLachlin, Hugh McLachlin, Arnprior; Thomas Mackie, Pembroke; Wm. Mackey, John Mather, Edward Moore, Capt. Murphy, Ottawa; J. W. Munro, Pembroke; G. B. Pattee, George H. Perley, Chas. E. Reid, Hiram Robinson, Peter Whelen, Ottawa; Hon. Peter White, Pembroke; Walter White, Ottawa..

The committee are preparing an elaborate progtamme. It is proposed to construct the flat-boat in which the Duke will shoot the slides on an extensive scale. The start will be made from a point near Britannia, and the Royal boat will be escorted by a flotilla of canoes and lumbermen's river boats, in which there will be a large number of shanymen dressed in the garb of the old-time voyageurs. His Royal Highness will be privileged to listen, it is said, to a programme of river songs as sung by the lusty voyageurs. Pork and beans (shanty style) will be supplied to the party at the base of Parliament Hill. It is intended to make the scene as representative as possible.

THE RECENT FIRES.

The principal losers by the late fires in the Temiscaming and Kippewa districts are the Shepard and Morse Co., J. R. Booth, Alex. Lumsden, Hull Lumber Co., Gillies Bros., of Braeside, and McLachlan Bros., of Arnprior.

Mr. D. B. Rochester, of the Hull Lumber Company, estimates the loss at from $500,000 to $750,000.

Mr. J. R. Booth has limits between 300 and 400 miles in extent, and it is said portions of these limits suffered severely.

The Shepard and Morse Co. have about 160 miles in the burned district, but the company does not expect to lose much. It was first reported all their limits were burned over, but this was found to be untrue.

Mr. A. Lumsden has about 100 square miles near Hay Bay, in the southern portion of the burned area. This limit is said to have been pretty well burned over. Mr. Lumsden also had about 100 square miles near Lake Kippewa, but this limit is believed to have escaped.

The Hull Lumber Company has limits about 300 miles in extent, and the fire has covered about tweney-five miles. The principal loss on this limit was in the destruction of young pine that would be valuable in a few years. A large quantity of the older pine, although damaged by fire, can be cut and saved.

The forest fire at Ingraham River, St. Margaret's Bay, N.S., consumed over one thousand acres. Mr. Beardmore, of Toronto, was the heaviest loser.

THE BEST BAND MILLS.

What are the best band mills in use to-day? I claim those with the most sensitive and equal tension are best. By equal tension I mean that both front and back columns will take up strain exactly alike.

I will endeavor to explain a little actual experience I lately had on a mill with a poor tension. The tension on this mill as it was originally built would raise and lower the columns alike under a certain amount of strain, but when a little more was needed—as was the case when sawing—the back column would take up the stretch in saw when in the cut, but the front column was not equal to the emergency, and would remain rigid, or perhaps on the contrary drop a little. This was caused by the straining device being so arranged that it gave a direct strain on the back column, but to get strain on the front column the builders of the mill had used four extra knuckles, two connections and two extra shafts, and the result was, the less hook I carried in my saw teeth the more the saws, when in the cut, would come ahead on the wheels. Why? Because the less hook I carried, the harder my saws cut (causing them to stretch more) and the more strain it put on the mill. The back column was equal to the extra strain and would take up the stretch in saw, but the front column was inclined to do just the opposite. Consequently, while sawing lumber with the mill in that condition, the average filer will readily understand which edge of the saw was bearing the heaviest on the wheel and whether it was possible to make straight edges with a good, heavy feed.

Some filers may say that making the saws long in the back would have helped it out. To those of that mind I would ask, would you not, right on the start, have had to tilt your top wheel ahead to take up that extra length of back saw? And wouldn't your back column have been right there to take up the stretch just the same, and the front column have acted as before? I tried it, and that was the way it served me.

Perhaps it would not be a bad plan for the foreman that informed Mr. GeBott there was no excuse for a filer having cracks in the backs of his saws to do a little experimenting on a mill where the straining device acted like the above. I was more fortunate than Mr. GeBott, as my foreman, when he saw the condition of the mill, at once set about to remodel the straining device, and consequently saved the saws and at the same time was able to get more and better lumber through the mill.

To others who have cracks in the backs of their saws, it might not be a bad plan for them to put the lines on the mill and see if the top wheel is not cross-lined into the log.—N. E. Huff in "The Wood-Worker."

BRITISH COLUMBIA LUMBER SHIPMENTS.

Following are the export shipments of lumber from British Columbia for the six months ending June 30th, 1901:

Name	From	For	Carg —Ft.
Antofagasta	Chemainus	Antofagasta	777,156
Alsterthal	Moodyville	Valparaiso	1,467,071
Sehome	Hastings	Valparaiso	728,193
Alex. Gibson	Moodyville	Cape Town	1,603,585
Athenian	Moodyville	Bombay	44,852
Palatinia	Moodyville	Yokohama	718,838
	Hastings		1,198,120
Admiral Tegethoff	Moodyville	Antofagasta	706,844
Dundee	Chemainus	Cork	1,712,532
Prince Victor	Hastings	Queensboro	784,942
Anna	Moodyville	Callao	1,332,873
Senator	Chemainus	Liverpool	1,074,930
Roland	Chemainus	Greenock	834,582
James Drummond	Chemainus	Fremantle	1,135,518
Antuco	Hastings	Callao	1,225,458
Passepartout	Barnet	Sydney	436,891
Commerce	Pender Isle	Santa Rosalia	169,540
Falls of Garry	Hastings	Sydney	1,627,472
Prince Albert	Hastings	Queensboro	1,211,970
Antonietta	Chemanins	W.C. of S.A.	790,434
Star of Bengal	Chemanius	Adelaide	1,461,765
Fantasi	Hastings	Liverpool	927,103
Eric	Pender Isle	Santa Rosalia	143,233
Sonoma	Chemainus	Melbourne	741,000
Mindoro	Hastings	Fremantle	880,650
Thalassa	Hastings	Plymouth	1,091,970
Hawaii	Chemanius	Taku	1,102,347
Palatinia	Hastings	Taku	883,094
Bangor	Hastings	St. Michaels	170,260
Sulitelm	Moodyville	Valparaiso	Loading
Cavour	Moodyville	Callao	"
Luzon	Pender Isle	Santa Rosalia	"
Sixtus	Chemainus	Continent	"
Highlands	Chemainus	Cape Town	"
Khorasan	Hastings	W.C of S.A.	"

To sharpen dull files, lay them in diluted sulphuric acid until they are eaten deep enough.

An authority suggests that in finishing white maple, only one coat of varnish be used, in order that the wood shall retain its whiteness; and let this be the lightest copal, of good body.

Mr. H. Sapery, manager of the Syracuse Smelting Works, Montreal, has just returned from an extended trip of three months on the Pacific coast and in San Francisco, and reports the condition of affairs very good.

W. H. C. Mussen & Co., dealers in contractors', railway and mining supplies, etc., 763 Craig St., Montreal, has recently received the sole agency in Canada for the wire rope manufactured by W. B. Brown & Co., of Liverpool, Eng.

Hose for fire-lighting purposes about mills and yards should have an outside connection. If the connection is within the mill, the fire may be in exactly the location to prevent the hose being used.

THE NEWS

A saw mill will be built at Waterville, Que., by F. G. Gale. &

A. Modiste is putting up another portable mill at Wawa, Ont.

A. D. Watson, of Clavering, Ont., is building a new saw mill in Keppel.

Halcombe Bros. have put in a new shingle mill at Little Rapids, Algoma district.

It is stated that Mr. Ainslie, of Comber, Ont., will build a planing mill at Sarnia

John Kalbfleisch is building a large dry-kiln in connection with his mill at Tavistock, Ont.

The recent strike of woodworkers in Ottawa has collapsed, the men having decided to abandon the fight.

The C. Beck Manufacturing Company, of Penetanguishene, Ont., have built a new steel refuse burner at their mill.

It is reported that the Saginaw Lumber Company, of Saginaw, Mich., have decided to build a saw mill at Sandwich, Ont.

The Moyie Lumber Company, of Moyie, B.C., have commenced operations. The mill has a capacity of 40,000 feet per day.

The Revelstoke Lumber Company, of Revelstoke, B.C., has elected James McMahon president, R. Houson secretary and D. Robinson manager.

E. Stewart, Dominion Forester, read a paper on "Tree Growing" at a meeting of those interested in the subject held at Brandon, Man., last month.

No. 4 saw mill of the Rat Portage Lumber Company, at Norman, Ont., made a record cut of lumber recently, the total for the day being 162,000 feet.

George White has built a new planing mill and sash and door factory at Parry Sound, Ont. The Parry Sound Lumber Company are also erecting a planing mill.

Nineteen of the twenty-six candidates who tried the cullers' examinations recently held in Hull, Que., were successful, but no names have been made public.

The mill of the Ontario Lumber Company at French River, Ont., again resumed operations last month, the tramways and yard having been rebuilt since the fire

William Lawton, W. I, Fenton, and others are seeking incorporation at St. John, N.B., to carry on the lumber and wood-working business of William Lawton & Sons.

The Parry Sound Lumber Company have had their mill at Parry Sound, Ont., connected with the town waterworks system. A fire brigade has also been formed by the employees.

Hugh Brennan, of Hamilton, and other members of the Mississaga Lumber Company, conferred with the town council of Meaford, Ont., recently regarding the erection of a saw mill there.

Thomas Southworth, chief of foresery for Ontario, has received a request from a firm of manufacturers to ascertain whether ironwood can be obtained in any considerable quantity in the province.

The exports from forest products from Canada during the year ending June 30th, 1901, totalled in value $30,003,857, as compared with $29,663,668 for the year 1900. The products of the mine show a large increase over the previous year.

Some of the British Columbia shingle manufacturers are using tin bands in lieu of the galvanized article, which is in short supply. The tin bands are made from cannery refuse and seem to answer the purpose very well, being light and strong and less likely to rust than the black bands. The cost, moreover, is only 3 1-2 cents a pound.

Price Bros. & Company, of Quebec, have just completed a new saw mill at St. Catharine's Bay, Saguenay, to replace the Ste. Etienne mill which was burned last year. The mill is very complete and was built under the supervision of C. P. Charlton.

In the village of Kingsbury, Que., Williamson & Crombie are operating a large saw mill and manufacture about 4,000,000 feet of lumber annually. Major Williamson, the senior partner, is now a veteran verging in the seventies and takes only a perfunctory part in the business.

The British Columbia Mills, Timber & Trading Co., of Vancouver, B.C., has shipped three spars to be used on King Edward VII.'s yacht to be built next year. Nearly all the famous yachts are using Douglas fir spars, and evidently King Edward knows a good thing when he sees it.

The Edward Sinclair Lumber Company, Limited, is seeking incorporation, with a capital of $42,000, to carry on the business of the late E. Sinclair, of Miramichi. The incorporators are the children of deceased, Bertha Ferguson, of Moncton, and O. W. Sinclair, of Eureka, Cal.

A. Cushing & Company, who recently purchased the Miller & Woodman saw mill property at Milford, near St. John, N.B., are putting the mill in readiness for work. One of the gangs has been removed, and the eight shingle mills formerly operated will be placed in the saw mill. The shingle mill will be converted into a box shook mill.

James Leigh & Sons, of Victoria, B.C., are making additions to their mills and will install machinery for the manufacture of show cases, shelving and other finished work. They are installing in their sash and door factory an Egan band saw for the manufacture of boxes, packing cases, etc., a trade which has been largely increased by the demands from the north.

In connection with the burning of the saw mill of Alfred Dickie at Lower Stewiacke, N. S., which took place on July 4th, it is said that the mill was in ashes in less than half an hour after the flames were first seen. The mill was equipped with modern machinery and had been built less than two years. This makes the fourth time that Mr. Dickie has lost his mill by fire.

The Pigeon River Lumber Company, which has acquired the saw mills of Graham & Horne, at Fort William, Ont., will likely replace the mills by new ones of larger capacty. It is estimated that the timber the company have in sight will supply 10,000,000 ft. a year for a period of fifteen years. H. Finger, the vice-president and manager of the company, has been engaged in the lumber business for a lifetime.

Contractor R. G. Reed, who has been trying to obtain the Government's consent to the transfer of his holdings in Newfoundland to a limited liability company, has accepted extensive modifications. It is said that he has surrendered 3,000,000 acres of land, containing large forests, at 30 cents an acre, as well as the ownership of the railway and telegraphs. It is stated that a bill to effect these changes will likely be passed by the Government.

The W. C. Edwards Company, of Ottawa, Ont., have provided for their employees club rooms nicely finished in oak. There is a large room for games, books, magazines and newspapers, and a kitchen where the men may warm their tea or food. There is also a class room in which those who desire to study matters bearing on their trade will be able to do so, and it is probable that a course of lectures will be given in this room during the winter months.

Mr. Marow, secretary to the German Consulate of Montreal, was a recent caller at the office of the Canada Lumberman.

CASUALTIES.

Edward Pelletier, an employee of McLaurin & McLaren, of East Templeton, Que., fell from the top of a pile of lumber, fracturing his left thigh and breaking his left wrist.

By being caught in the live rollers at the saw mill of the Rat Portage Lumber Company, James Flett was badly injured, necessitating the amputation of a portion of his foot.

Andrew McKillop, employed in a steam saw mill at Sydney N.S., was caught in the machinery and whirled in the air for several minutes, but received only slight injuries.

A serious accident occurred last month at the mills of the Brunette Saw Mill Company, New Westminster, B.C. By the bursting of an emery wheel the face of George Coulson was badly cut.

THE TIMBER SUPPLY.

At a recent meeting of the Society of Arts, in London, Dr. W. Schlick read a paper on "The Outlook for the World's Timber Supply." The first part of the paper was occupied with statistical details on the export and import of timber in the various countries of the world.

As regards Europe, Dr. Schlick reached the conclusion that the present deficiency of 2,620,000 tons were sure to increase, because the European sources of supply were not likely to meet the additional 600,000 required annually; personally he would not be surprised, if ten years hence the deficiency amounted to three or four times the present quantity. Of the importing non-European countries, taken all together, there was no doubt the net imports would increase as time went on. Of the exporting countries, the regions around the Caribbean sea exported mahogany and other furniture woods, but they also imported so much lumber, that their net exports were only 13,000 tons a year. The west coast of Africa exported various hard woods, but they were so expensive, that they hardly affected the question. British India could not do more than send some teak and furniture woods. In Asiatic Russia, even supposing there was a surplus of production for export, the cost of transport would be practically prohibitive. The timbers of Central Africa were not of the sort required in Europe in large quantities, apart from cost of transport, and in South America matters were in a similar position. It would not be possible, he felt sure, for the United States to meet, for any length of time, the increased demand which they had supplied for the last few years. Their present annual production, estimated at 75,000,000 tons, was exceeded by the present annual consumption by 33 per cent., and this meant that they consumed annually, not only the legitimate growth or increment, but also a portion of their capital. Fortunately the seriousness of the position had been recognized, and efforts were being made to introduce more conservative lumbering, and to protect the forests against ravages by fire and grazing. As to Canada, it has not responded to the extra requirements of Europe, and he doubted whether it would be able to do so in the future, unless decided steps were taken at once, to start thorough protection and systematic management on selected areas, or, as they might be called, reserved state forests.

There should be no difficulty in permanently reserving 100 million acres, and if half the annual revenue—£700,000—derived from Canadian forests were devoted to that purpose, substantial progress could at once be made to secure not only the present, but an increased output for any length of time, leading ultimately to a revenue tenfold, or more, the present amount and securing a permanent supply of coniferous and other timber for the world. In the second part of his paper, Dr. Schlick drew attention to a few lessons that might be learned as regards the British Empire as a whole and these islands in particular. With all the forest wealth of the colonies, we imported into the empire timber valued at

nearly £18,000,000 every year, and the sum lately had risen at the rate of £771,000 annually. Surely the time had come for a more vigorous forest policy on sensible lines throughout the empire. Systematic forest management should be introduced, more particularly into Canada and Australia, and, above all, let the self-governing colonies consider a little more seriously, that hitherto the magnificent example set by India. But we should begin by putting our own house in order. The imports of timber into the United Kingdom in 1899 were valued at £25,000,000, and of late years they had increased at the rate of 332,000 tons, £919,000, annually. Eighty-seven per cent. of the total consisted of pine and fir, the sources of which were specially exposed to exhaustion, and where were we to obtain the nine or ten million tons of coniferous timber we required, when the countries around the Baltic, and perhaps also Canada, had begun to fail us? Yet we had sufficient, and more, surplus land at home to produce all this timber without putting a single acre out of cultivation. There were 12,000,000 acres of waste land and 13,000,000 acres of mountain and heath land, from which to choose the necessary six or seven millions, and surely £25,000,000 going out of the country every year was money enough to take some trouble about.

A MICHIGAN DECISION ON DRIVING HARDWOOD LOGS.

The following account of a recent decision regarding the driving of hardwood logs will be of interest to Canadian lumbermen :

The Supreme Court of Michigan has decided in the recent case of Bellows v. Crane Lumber Co., 85 N. W. 1103, that where a stream was obstructed by defendant placing therein and attempting to drive hardwood logs, many of which sank, it was error for the trial court to charge the jury that plaintiff could not recover the expense of removing such obstruction to driving their logs, if the jury found "that the defendant was driving the logs in a reasonable manner, put in sufficient men, and was using all diligence to keep the river clear," since the question whether it was reasonable for defendant to place in the river and attempt to float such logs should have been left to the jury.

Mr. Justin Hooker, writing the opinion of the court, said : "Comp. Laws, 5075, makes it the duty of every person who uses the waters to run logs to put on men enough to prevent obstructions to navigation, and gives to others the right to compensation for increased labor in floating their logs in consequence thereof. It would be going a great way to say that a man has the right to attempt to run logs that will sink, at any time he chooses, if, by reason thereof, it will be impossible to run them, or necessarily and seriously obstruct navigation. The court instructed the jury that defendant had a right to run its hardwood logs, and that, if they used all reasonable diligence to get their drive down the river, and employed all the men on the same that was practicable, and did not do anything unreasonable to delay the plaintiffs or obstruct the use of the stream, they could not then take into consideration the fact that the upriver drive overtook them, or was hindered by them, for the lower drive had the right of way, so to speak. He added : That is, if you find that the defendant was driving the logs in the reasonable manner, put on sufficient men, and using all diligence to keep the river clear. This instruction might be considered correct were it not for the fact that is claimed that, owing to the alleged improper attempt to float logs that should have been expected to sink, it was made impossible for any one to keep the river clear.

"If it is true that a million and a half of these logs could not be floated down the river, and were not, but sunk, and remained along the stream, the fact that the defendant was making great efforts to bring up its rear, and do an impossible thing, should not preclude plaintiffs from recovering the expense in getting their logs by such obstruction and the jams formed thereby. In a sense a man has a right to float logs when he chooses, but it does not follow that he may expect others to suffer because of his unreasonable attempt to float logs which he ought to know will not float. It was a question for the jury whether it was reasonable to attempt to float the logs. It is proverbial that a "stern chase is a long one," and significant that defendant's rear was overtaken by a drive which started 100 miles behind, and substantially at the same time. The fault may have been in the attempt to float logs not in a condition to float, and in such case it was not proper to give the jury to understand that, if the defendant was working all the men practicable and using all reasonable efforts to clear the stream, the plaintiffs must suffer for their inability to clear the river of logs that they should not have attempted to move at the time.

"We think a discussion of other questions raised unnecessary, except that in relation to costs. Plaintiffs contend that it appears that their claim was established at more than $100, and was reduced by set-off. This cannot be said to affirmatively appear from the record. The judgment is reversed, and a new trial ordered." The other justices concurred.

NEW CENTURY IDEAS.

The Toronto Exhibition to be held from August 26th to September 7th, announces that its principal characteristic will be the adoption of New Century Ideas. The phrase might be considered a bit indefinite but for the fact that contemporaneously the statement is made that there will be daily and nightly displays of all the new weapons of war as well as recent developments in the arts of peace. The pom-pom will be on view, wireless telegraphy will be shown in practical use off the shore to passing vessels, magnificent displays of illuminating effects will be made, recently announced developments in electricity will be shown, demonstrations will be made in the cultivation of the sugar beet, modern methods of rescuing at sea will be illustrated, manœuvres with latter-day artillery will take place, in fact the military will be very much in evidence in all its branches, while the handy-man and the marines will also be used largely in the off-shore operations and the brilliant nightly spectacle the Bombardment of the Taku Forts by International Forces. An International Military Tattoo will be the feature of the opening night, when a large body of troops will be utilized. Reduced fares will be given by all the railways.

THE ELECTRIC BOILER COMPOUND CO. LIMITED
Guelph, - Ontario.
Manufacturers of ...
WALKER'S ELECTRIC BOILER COMPOUND
and Sole Agents for Canada of the Brooks Oil Company, Cleveland
We have made a special and scientific study of the waters and conditions existing in the different localities in Ontario, and can cope with conditions existing anywhere. We don't care how hard or troublesome your scale is, we can clean your boilers without injury to boiler, packings or connections. BROOK'S OILS are perfect lubricants—give them a trial. WOOD PULP DEPARTMENT

BRITISH IMPORTS OF WOOD PULP.

The imports of wood pulp into Great Britain during the first six months of this and the two preceding years were as under :

YEAR		VALUE.
1901.....224,678	tons.	£1,220,900
1900.....232,020	"	1,213,070
1899.....196,114	"	934,681

The following figures show the comparative imports from the countries mentioned : —

NORWAY.

1901.....128,455	tons.	£550,630
1900.....141,214	"	641,060
1899.....118,781	"	465,882

SWEDEN.

1901..... 49,271	tons.	£401,045
1900..... 55,661	"	386,840
1899..... 42,947	"	289,639

CANADA.

1901..... 33,757	tons.	£162,822
1900..... 18,832	"	74,048
1899..... 16,445	"	63,778

UNITED STATES.

1901..... 6,741	tons.	£54,400
1900..... 4,711	"	18,466
1899..... 8,043	"	48,620

OTHER COUNTRIES.

1901..... 6,454	tons.	£52,003
1900..... 11,602	"	92,656
1899..... 9,898	"	66,762

During the last six months there was a shrinkage of 7,342 tons in the British demand for wood pulp, compared with the corresponding half of 1900. Whilst the shipments from Norway, Sweden and other countries declined, those from Canada and the United States show an increase.

THE BELGO-CANADIAN PULP MILLS.

The new mills of the Belgo-Canadian Pulp Company at Shawinigan Falls, Quebec, when completed, will be the largest individual mills in Canada. The plans call for a ground wood mill which will make 100 tons of ground wood pulp, 50 tons of bleached sulphite pulp, and 100 tons of newspaper every twenty-four hours.

Ground was first broken for these mills October 15th, 1900, and the ground wood mill will be in operation September 1st, 1901, with a shipping store house, 100x250 feet, two stories high, with two standard guage railroad tracks through the centre, so the floor of a car will be level with the shipping room floor.

Fifty tons of this pulp will be pressed about 40 per cent. dry, and fifty tons pressed and dried to about 88 per cent. dry. This dry pulp will be cut into sheets 24x36 inches, pressed into bales, each weighing about 450 pounds, as will also the wet pulp, and wrapped in jute. This mill has 24 grinders, with stone 19x54 inches; 26 ten plate screens, and 13 of the 72-inch wet machines, all furnished by the Friction Pulley and Machine Works, Sandy Hill, N.Y.; two 128-inch Fourdernier drying machines and one Jordan engine, furnished by the Black & Clawson Company, of Hamilton, Ohio. The necessary wood preparing machinery and conveyors are furnished by the Waterous Engine Works Company, Brantford, Ont.; 600 horse-power of boilers, furnished by the Sterling Company, Chicago, Ill.; 20 special turbine wheels and hydraulic feeder gates for each, and six hydraulic bailing presses, furnished by the Holyoke Machine Company, Holyoke, Mass., and the heating and ventilating plant, furnished by the B. F. Sturtevant Company, Boston, Mass.

This mill is built of concrete, brick and steel throughout, except the shipping-room floor, which is wood, known as mill construction, and is looked upon to be the most complete and modern mill in this country when completed, from the fact that the only belts used in the mill are on the wood preparing machinery and wet machines.

Two grinders are driven with one wheel direct, connected to the grinder shaft. The 26 screens and one pulp grinder are driven with one wheel directly connected, and the Jordan engine, one large stock pump, the wet machines, the drying machines, the wood room shaft and the lighting generator are also each driven with one direct connected wheel. So the superindentent or foreman operating a mill where every machine is driven by belts or gears will appreciate the fact that the operating expenses in this mill are reduced to the minimum.

These mills were designed by, and are being built under the supervision of the well-known hydsaulic and mechanical engineer, A. C. Rice, State Mutual Building, Worcester, Mass.

PULP NOTES.

General B. C. Tilghman, the discoverer of sulphite fibre, died in Pennsylvania last month.

The paper mill of the Canada Paper Company, at Windsor Mills, Que., was destroyed by fire on July 29th. The loss is about $200,000.

It is announced that Mr. Tobin, M.P., has completed arrangements for the erection of a pulp mill at Brompton Falls, Que., the municipality having granted financial aid towards the project.

It is reported that New York capitalists have acquired large tracts of timber land at Wolfville, N.S., from S. P. Benjamin & Company, with the intention of establishing a large pulp mill.

Several Canadian manufacturers of pulp were creditors of Taylor Bros., of Toronto, who assigned recently. The estate is being wound up, and it is thought that the unsecured creditors will get very little.

The failure is announced of C. W. Thompson, until recently manager of the Consolidated Pulp & Paper Company, of Toronto. The embarrassment is understood to have been caused by the failure of the latter concern.

The barge Advance recently loaded 600 cords of pulp wood at Providence Bay, Manitoulin Island, for Erie, Pennsylvania, the shipper being Mr. Lehman, of Kogawonk, who has a contract to supply 7,000 cords this season.

An American company is said to be negotiating for the purchase of the pulp mills at Jonquieres, in the Saguenay district, Quebec, as well as the valuable water powers near the mills. A. K. Hansen & Company, of Quebec, are acting as agents.

Thomas Meaney and Henry Holgate, C.E., of Toronto, are at present at Seven Islands, Labrador, making plans, etc., for developing wates power to operate a new pulp mill which Messrs. Thomas Meaney & Company propose to erect at that place.

W. H. Davis and David Russell, of Montreal, representing a syndicate, are reported to have purchased an extensive area of spruce timber limits situated at the head waters of the St. Maurice River, Quebec, and intend to develop the water power and erect a large paper and pulp mill.

An experimenter in the pulp line says that he is able to take nine shavings from the planing mill, and, after cooking them three hours in nitric acid and caustic soda, produce a fine, long fibred pulp at a price that would make the ordinary pulp maker turn green with envy.

At a late meeting of the shareholders of the Maritime Sulphite Fibre Company, of Chatham, N.B., a resolution was passed to the effect that the company should cease doing business, and accordingly the mill was closed about two weeks ago. The cause of this action has not been learned, but it is thought that the business has not been conducted with financial success.

The Riviere du Loup Pulp Company has been organized in Toronto, with a capital stock of $500,000, to carry on the works pertaining to a pulp company and acquire the rights of the Riviere du Loup Company, incorporated under Quebec laws. A. C. Ross, ol Toronto, C. Kloepfer, of Guelph, and Hon. J. R. Stratton, of Peterborough, are provisional directors.

In reporting upon the wood pulp market in France, M A. L. Grondal, of Paris, states that transactions are insignificant in mechanical and the tendency is towards lower prices. In chemical the market is inactive, consumers showing a preference to wait until the situation is on a more permanent basis before making arrangements. As a consequence contracts will be closed much later than usual this year, in the hope that prices will be more steady.

Notice has been given of the incorporation of the Miramichi Sulphite Fibre Company, with a capital of $1,000,000. The intention of the promoters is to acquire the timber limits and saw mills of the William Richards Company, of Chatham, N.B., and to build a 50-ton sulphite fibre mill at that place. One of the promoters, John Moravec, is an experienced sulphite libre manufacturer, and has prepared the plans for the mill. The town is to give a bonus of $15,000 when the mill is in working order.

It has long been a source of regret to French papermakers, and the trade at large, that in spite of the very large quantities of wood pulp consumed in that country, there are but few factories of note manufacturing this material on the spot, although suitable timber is to be had in large quantities in numerous localities. That there is an opening for industrial enterprise of this kind seems to be amply proved by the fact that during last year 134,213 tons of wood pulp were imported into France, valued at about £1,430,000.

The James McLaren Company, of Buckingham, Que., are about to construct a large pulp and paper mill at that place. It is the intention to manufacture only mechanical pulp at present, but provision will be made to start paper making as soon as the trade conditions warrant it. William Kennedy, of Montreal, has charge of the hydraulic work. The contract for the brick and concrete work has been let to Holbrook & Sutherland, of Ottawa. The McLaren Company own extensive spruce limits in Northern Quebec which will furnish a plentiful supply of spruce for the mill.

Speaking of the erroneous report that the mills of the Sault Ste. Marie Pulp & Paper Company were closed down on account of an insufficient demand, Mr. Clergue says : "We are now running the pulp mill to its capacity, and find no trouble in disposing of all the pulp we can turn out. We are sending it to England, France and Germany and Japan. There is no danger of the mill being closed." The Sault Ste. Marie Company have for some time been making and selling mechanical wood pulp. It is now proposed to make a mixed pulp, putting into the ground wood a percentage of sulphite pulp for the various requirements of the paper trade. Connec-

on is now being made between the two mills, nd the proper mixing machinery is being install- in the mechanical mill. Pulp containing any quired percentage of sulphite will be delivered paper mills.

The Oriental Power & Pulp Company, Limited, as been incorporated by the British Columbia overnment, to build a pulp mill in that prov- ce. The capital is $100,000.

Concerning the outlook for pulp in Canada the aper Mill, of New York, says: "It looks as if ie time were at hand when the only way to ake a continued expansion of the pulp industry ay would be to build new paper mills to take re of the product of new pulp mills. It is as aper that the product of Canada's pulp wood ill be marketable with most chance to profit. o stop short of this product when nearly the hole labor cost of producing paper from the ee has been incurred seems to be bad economy, nd that it is bad economy is the evident lesson the present situation. If there were paper mills enough in Canada to absorb the output of the pulp mills, the bankers would not now be talking as if they meant to stint their support to the pulp industry."

CLOSING OF A PULP MILL.

The suspension of business by the Maritime Sulphite Fibre Company, of Chatham, N.B., has furnished food for much comment regarding the prospect for finding a market for all the pulp that will be manufactured in Canada when the mills now under construction are completed, and of operating mills at a profit. The Chatham World gives expression to the following views:

"The suspension of the Maritime Sulphite Fibre Company does not mean that the manufacture of sulphite pulp is not profitable on the Miramichi, and that another mill might not pay good returns on the capital invested. It means nothing of the kind. There is a big profit on sulphite pulp, especially on a good quality of the article, and a worldwide market for it. The trouble with the Maritime Sulphite Company is not that it has not been operating at a good profit, but because all its earnings have been swallowed up by its interest account. Its works have cost at least twice as much as they should have cost, expensive plants having been put in and torn out by successive managers in a most wasteful manner, and the capital, instead of having been put in by the stockholders, has been borrowed at too high a rate of interest for an inhustrial establishment to pay. The mill pays but does not pay enough to keep the interest account square and leave anything for the company. The Dominion Pulp mill, which was built economically, and has been managed as an industrial establishment rather than an experimental station for testing the merits of different sulphite plants, is paying its owners good dividends, and a new mill, if built and managed by practical men, would, no doubt, do likewise. The Maritime Sulphite Fibre Company's mill, now in possession of the Royal Trust Company, acting on behalf of the bond holders, will soon be sold, no doubt, and then operated profitably. It has suspended because it cannot pay bank interest on a half million dollars, but it might pay good dividends on an investment of, say, three hundred thousand.

CORRESPONDENCE SOLICITED

THE above view shows one of the many styles of setting and case to which our

CROCKER PATENT TURBINE

may be adapted This plant was built for direct connection to Wood Pulp Grinders.

We invite correspondence from those contemplating the erection of Ground Wood Mills. Estimates submitted for complete equipments.

Let us have your address and we will send you a copy of our new 1900 Turbine Catalogue, also circulars of the Port Henry Grinder, etc.

THE JENCKES MACHINE CO.
36-40 Lansdowne Street - SHERBROOKE, QUE.

PERSONAL.

Thomas Mackie, M.P., of Pembroke, Ont., last month went to Saskatchewan, N.W.T., to inspect timber limits in that district recently purchased by him.

A valued official of the Crown Lands Department of Ontario passed away at his residence in Toronto Junction on July 13th, in the person of Mr. Alexander Kirkwood, for many years chief of the Accounts branch of the above-named Department. Mr. Kirkwood retired from the Crown Lands Department in October last, after a service extending over forty-seven years. At his death he was seventy-seven years of age. He was possessed of a great capacity for work, and had given close attention to the books of the Department. He always took a deep interest in forestry, and was a member of the Ontario Forestry Commission, which presented its final report to the Government about one year ago.

Mr. D. Laine, one of the founders of the well-known firm of Carrier, Laine & Company, of Levis, Que., dropped dead on June 28th. Deceased was a successful business man and highly esteemed. He was a member of the Council of Arts and Manufactures of the province and of the town council.

LUMBERMEN'S WEEK AT THE PAN-AMERICAN.

There is to be a great re-union of lumbermen from all parts of the country at the Pan-American Exposition in Buffalo during Lumbermen's Week, August 26th to September 1st. The committee in charge consists of Messrs. John N. Scatcherd, Geo. P. Sawyer, and Alfred Haines. Mr. R. A. Eaton, superintendent of the Buffalo Business Men's Association, will furnish information regarding accommodation, etc., to those intending to visit the Exposition.

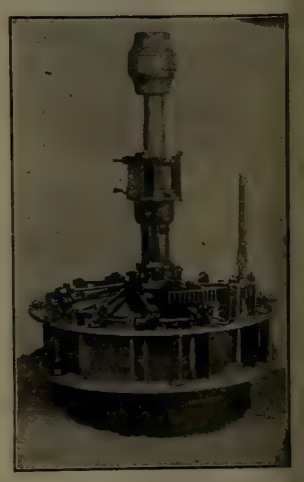
THE LEFFEL AND VULCAN TURBINE



POSSESS DISTINCTIVE MERITS, which should have the attention of water power owners 1st—They are strongly and carefully built. 2nd—They are economical in their use of water. 3rd—They develop more power in proportion to the water used than any other Turbine built. Mr. J. D. Flavelle, of the Flavelle Milling Co., of Lindsay, writes us under date of March 7th as follows:

"Referring to the two 74" water wheels (Leffels) purchased from you during the past year. As far as we have had an opportunity of testing, they have done their work excellently, in fact are doing more than you guaranteed them for. We took a test of the power they were developing with a head of water of 3 ft. 10 in, and they developed very close to 100 h. p. We are thoroughly satisfied with same."

This letter is but one of many such.

We also Manufacture **The Lane Saw Mill, Four Styles of Shingle Machines, Lath Machine Edgers, Trimmers, Pulleys, Hangers, Boxes, Etc.**

The Wm. Hamilton Mfg. Co., Limited

Branch Office: VANCOUVER, B. C.

PETERBOROUGH, ONT

R. H. SMITH CO., LIMITED

St. Catharines, Ont.

We are the Sole Manufacturers of Saws under the **Simonds' Process** in the Dominion of Canada.

There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. **All such Claims are FALSE,** as the patentee in the U. S. and ourselves are the only firms in the world who use it.

MILL STREAM, QUE., on I. C. R'y, December 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—Driving a 20 in. 13 gauge saw into frozen hardwood, using a 9 in. 4-ply belt, if it can be done satisfactorily, is a very severe test. Your saws have stood that test better than any I have tried. I have been experimenting with different makes—both home and imported—during the last five years, and give yours the preference. Last order is just to hand and will report on them by and bye.

Yours very truly, JAMES McKINLAY.

CAMPBELLTON, N.B., Nov. 17th, 1894.

R. H. SMITH CO., LTD., St. Catharines, Ont.

DEAR SIRS,—In regard to your Shingle Saws, you can say that I have been using Shingle Saws of your make (Simonds) for the past four years, and they have given good satisfaction. I am running nine machines and use a good many saws, but have never had a saw yet that did not work satisfactorily. Before using your saws I used saws of American make, which worked well, but after giving your saw a trial have continued to use yours, as they are cheaper, and in regard to working qualities are all that is needed.

Yours truly, KILGOUR SHIVES.

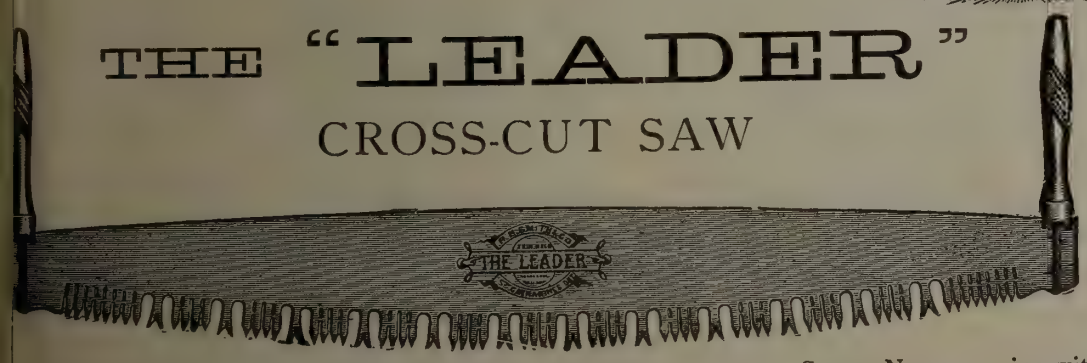
CLAVERING, ONT., May 3rd, 1897.

R. H. SMITH CO., LTD., St. Catharines, Ont.

GENTS,—In reply to your letter asking me how I liked the 62" SIMONDS Saw, I must say in all my experience I never had a saw stand up to its work like the one purchased from you last month. Having used saws for the last 22 years, and tried different makes, I can fully say it is the best saw I have ever had in my mill, and would recommend the SIMONDS' Process Saws to all mill men in need of circular saws. Yours truly, W. G. SIMMIE.

P.S.—I am sending you my old saw to be repaired; please hammer to same speed as new one. W. G. S.

THE "LEADER" CROSS-CUT SAW



These Saws are made from the best DOUBLE REFINED SILVER STEEL, warranted four gauges thinner on back than front, and the only Saws on the market that are a perfect taper from the points of the teeth to the back, and require less Set than any other Cross-Cut Saw.

They are tempered by the Simonds' Patent Process, insuring a perfectly uniform temper throughout the plate, and stand without a rival as the BEST, FASTEST, AND EASIEST-CUTTING SAW KNOWN. A gauge to regulate the clearing teeth is furnished with each saw.

Directions for Setting and Filing are plainly Etched on every Saw. None genuine without our Registered Trade Mark as shown in cut.

THE "LEADER" SAW SWAGE

Made in 3 Sizes—$2.00, $2.50, $3.00, etc.

OUR PRICES ARE RIGHT. KINDLY ALLOW US TO QUOTE YOU BEFORE PURCHASING.

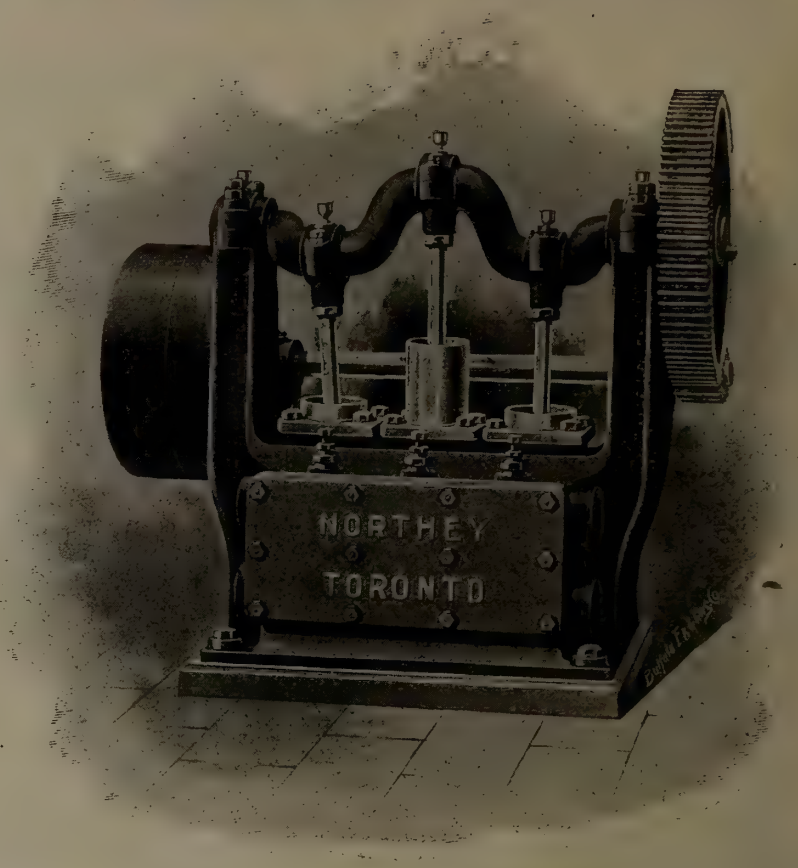
Northey Triplex Power Pump

FOR BOILER FEEDING AND GENERAL PRESSURE PURPOSES

In the Northey Triplex Power Pump we offer a machine put together with the skill brought by years of experience in pump building, and with full provision made for the varied demands likely to be made upon a pump of this character. A feature of value is that the three cranks are placed 120 degrees apart, thus giving a practically constant flow of water—minimizing strain on pump and economizing power. The pump can be readily repacked and taken up, and all details are carefully worked out. It can be conveniently operated by electricity, by water power, or by belt from engine. Different styles and sizes made to suit all duties.

WE ARE MANUFACTURERS OF OVER FIVE HUNDRED DIFFERENT STYLES AND VARIETIES OF STEAM AND POWER PUMPS FOR STATIONARY AND MARINE PURPOSES. WE INVITE ENQUIRIES FROM ENGINEERS, MINE SUPERINTENDENTS AND OTHERS FOR THEIR REQUIREMENTS IN OUR LINE. CATALOGUES AND SPECIFICATIONS FURNISHED UPON REQUEST.



We are also manufacturers of the Northey Gas and Gasoline Engine which has proved to be the handiest and most convenient power for small or intermittent power users in the market. Suitable for machine shops, pumping and electric light plants, etc. Write for illustrated descriptive booklet.

TIMBER AND FORESTRY EXHIBIT.

A representative of the CANADA LUMBERMAN who is now in Great Britain has forwarded two photographs of the Canadian timber and forestry exhibit at the Glasgow Exhibition. The photographs, of which reproductions appear in this number, are believed to be the best which have yet appeared in print, and give a good understanding of the variety of timber products on exhibition. The timber is shown in all stages of development, from the rough trees as they are cut in the forest to the highly polished furniture into which they are ultimately transformed. We are informed that the exhibit has attracted much attention, the visitors including many users of timber in Great Britain who have heretofore known little of the timber resources of Canada.

CANADIAN TIMBER AND FORESTRY EXHIBIT, GLASGOW EXHIBITION.

WHITE PINE CONDITIONS.

AT the semi-annual meeting of the Mississippi Valley Lumbermen's Association, held in Minneapolis on August 20th, a most important report on market conditions was presented by the secretary. As this Association represents the majority of manufacturers in the leading white pine district of the United States, the statements presented will no doubt interest many of our readers. The report is therefore given in part below :

At the close of the year 1899 the country thought that the climax of prosperity had been reached and that the pendulum would begin to swing in the other direction. While it is true that 1899 broke all records in the production and consumption of lumber, yet the year 1901, if it maintain anything like the record it has already achieved, will prove a close second if indeed it shall not set a new high water mark in point of demand at least.

Following the restoration of confidence last November it became evident that the pendulum of prosperity was not likely to begin on its backward journey at once. The movement of lumber since the first of the year has increased monthly. Shipments by the manufacturers of the Mississippi and Wisconsin valleys for January, 1901, were 126,239,302 feet. In July, 1901, they were 258,405,860 feet, an increase of 132,166,558 feet, or 105 per cent. in seven months. In January, 1900, the shipments by the same manufacturers were 114,255,775 feet, and in July, 1900, they were 188,887,489 feet, an increase of 74,631,714 feet, or 65 per cent. Shipments for the seven months of this year were an even 25 per cent. greater than for the same months last year, or an increase of 270,000,000 feet. Shipments to date are as large as during the first seven months of 1899. Exact figures for that year are not obtainable, but it will be remembered that the heavy volume of business of 1899 was during the latter half of the year. A possible increase in the production of this season over last year can have but little effect upon the market in view of the largely increased sales. There is no doubt that shipments to date would have been considerably larger had manufacturers' stocks been in condition.

The very satisfactory demand of the year has come largely from the country and indicates the extent of the building activity in the whole Mississippi valley. The greater part of the lumber sold in 1899 was used for special purposes, manufacturing plants of all kinds being large consumers and the demand for box lumber being unprecedented. While the demand from this source has been large this year, owing to the general prosperity of the country, yet the demand for actual construction has never been as great. This is a most pleasing phase of the situation, as it indicates the material development of the country.

In order fully to understand this heavy movement of our product, it must be noted that our competition with other woods has never been less. A large grain crop in the southwest last year, followed by a good crop of cotton for which more actual money was realized than any previous cotton crop the south ever raised, put the business of the yellow pine producers upon a very satisfactory basis. Nearly as much cotton and cotton products were sold abroad during the year as all the provisions and breadstuffs combined, and a price of 10 cents for cotton has resulted in a general development of the whole south country, with a consequent good demand for lumber.

The reports of the yellow pine clearing house for the first five months of this year are exceedingly flattering. During that time last year this cut exceeded the shipments by 63,000,000 feet, while the shipments this year for the same time exceeded the production by 92,000,000 feet ; and this in view of the fact that the cut this year was greater by 64,000,000 feet.

The production of hemlock for the season may be somewhat less than for last year, but the aggregate is not sufficient to cut any serious competition at any time.

The situation at the head of the lakes developed before the opening of navigation, when about 60 per cent. of the season's cut had been sold. Lake shipments have kept pace with those by the interior mills, shipments for July being the largest ever known. Duluth alone shipped 55,000,000, exceeding the largest previous month on record by 10,000,000 feet.

A year ago building in Chicago was tied up by a strike. A comparison between the building of last year in that city with that of the present year will explain some of the increased call for building material. For the seven months to August 1 last year Chicago had issued 1,620 building permits, aggregating $6,645,340, while for the same time this year there have been issued 3,692 permits, representing $20,945,355. The building permits for twenty of the principal cities of the United States for the July just passed show an increase over last year of 42 per cent.

PRESENT AND FUTURE DEMAND.

But it is hardly necessary at this time to analyze the conditions which have prevailed during the past half year. Suffice it to say that they have been satisfactory. The question that now faces us is : " Is the demand for lumber likely to continue in as satisfactory volume during the remainder of the year ?"

Having begun the year with stocks in badly broken condition, the situation in that regard has not improved up to this time, as sales have very nearly kept pace with the production. It is a fact that the assortments of lumber in the hands of the white pine manufacturers are to-day more poorly adapted to the needs of the general trade than at any time in the history of the business. Buyers have been unable to get many staple items which they desire, and the extent of the "piecing up" among the manufacturers themselves has indicated a demoralized condition.

Most of the lumber which has been shipped up to this time has gone into actual consumption. There has been comparatively little buying for the future, and the stocks held by the dealers are generally not more than is required for immediate use. While some orders have been placed in anticipation of a shortage of cars, dealers generally, both line and single yard, state that they will be obliged to buy stock for the fall trade.

As a natural consequence of the failure of spring wheat in North Dakota and northern Minnesota last fall, the manufacturers of northern Minnesota were obliged to seek a market for their product in the territory south of Minneapolis. This meant a very large increase in the amount of lumber to be disposed of in southern Minnesota, Iowa, Illinois and the southwestern states. This year, however, a very satisfactory crop of wheat is being harvested in the north-west, with the result that the northern Minnesota mills will be able to market most of their product in the tributary territory. This is far more of a factor in the general situation than is at first realized. Last spring the north-western railroads took a large number of settlers into the Red River valley and immediate country, an estimate placing the number at 30,000 people. These were for the most part men who had sold their valuable farm lands in the middle states at a high price, being tempted by the cheap and fertile lands of the northwest. With their first year's crop a success these settlers, who are builders of new homes, have become large users of lumber. This increase will very largely offset any decrease which might be experienced from the southwest, where the corn crop is a partial failure. The aggregate production of northern mills last year exclusive of Duluth, Cloquet and the range was 420,000,000 feet.

CANADIAN TIMBER AND FORESTRY EXHIBIT, GLASGOW EXHIBITION.

NO DECLINE IN SIGHT.

Those who have been expecting to see a decline in the price of lumber will be disappointed, and in this respect the prosperity of the northern lumberman is more than temporary.

On August 1 last year 156 manufacturers, including nearly all of the white pine producers west of Michigan, reported a total of 1,708,821,362 feet of lumber on hand. This was a decrease of 215,238,465 feet over that held by the same firms on August 1, 1899, or 11 per cent.

Reports from the same manufacturers showed an increase of 21 per cent. in the amount of lath held August 1 last year over the amount on hand August 1, 1899, and a decrease in the amount of shingles of 29 per cent.

It will be remembered that in 1899 there was a general scarcity of lath which encouraged their greater production in 1900, somewhat at the expense of shingles.

On January 1, 1901, manufacturers representing the same territory held 1,772,003,626 feet of lumber. This did not include the inventories of all those who had reported stock on hand August 1, but those not included, being about thirty, manufacture not more than a million feet a year each.

Up to August 1 this year seventy-four firms in the Mississippi and Wisconsin valleys had shipped 1,392,611,771 feet of lumber. Had reports of sales been received from all whose inventories were included in the annual stock sheets compiled January 1, they would show that the year's stock was turned this year between January 1 and August 1. As a large number of our members report this to have been true with them, we take it that our statistics are verified.

SHIPMENTS GREATER THIS YEAR.

Shipments for the year to date have been 23 per cent. greater than those during the first seven months of last year. The stock of lumber on hand August 1 this year is 7 per cent. less than that held by the same firms last August. No comparison with the total feet on hand last year can be made as our reports do not include all who reported last August.

The amount of lath held by the manufacturers of the Mississippi and Wisconsin valleys this August is 19 per cent. less than that held last year.

The amount of shingles is 24 per cent. less than that held last year.

Therefore, in brief, the statistical situation is as follows :

An amount of lumber equal to that held by the manufacturers on January 1 had been sold up to August 1.

Sales to August 1 were a quarter larger than during the same time last year.

The lumber on hand August 1 was 7 per cent. less than that on hand last year. This is 18 per cent. less than that held on August 1, 1899, or, considering the same percentage of decrease to apply to all the stocks reporting the former date, is 346,330,768 feet.

The amount of lath as compared with a year ago is 19 per cent. less.

The amount of shingles as compared with a year ago is 24 per cent. less.

We stake this as a verification of our statement that the demand for the year has been largely for building purposes.

LOGGING WITH ELEVATED CABLES.

To the Bridal Veil Lumbering Co., of Bridal Veil, Oregon, is due the credit for two innovations in handling timber in a rough mountainous country. The trailing of logs between the rails with a locomotive was first successfully demonstrated at its camp. This plan is now in general use all over the Pacific coast, wherever the grades of logging roads are too steep to admit of the handling of logs with cars.

The accompanying picture shows the adaption of a method which is working successfully in handling timber out of deep canyons, where it is not practicable to reach it by means of railroads. Mr. Palmer, the president of the company, and who superintends the logging operations, decided to try the plan of logging the timber in a canyon about 150 feet deep and 500 feet wide by means of a wire cable secured to trees on either side of the gulch. The timber in this gulch had previously been abandoned on account of the excessive cost ot logging.

The cabin used is a six-strand, plow steel rope, 550 feet in length. The cable is suspended from trees on either side of the canyon, at an angle of about 45 degrees, on which is mounted an ordinary block. An engine in the canyon yards the logs to the trolley line. A bridle is passed around the center of the log, which is hoisted to the top of the canyon in about seven minutes by another engine. When the log is relieved the trip line is carried back by its own momentum. When the writer witnessed its operation a log scaling about 1,400 feet was being hauled. Logs scaling 3,000 feet have been successfully handled.

Logging timber by means of wire cables has been in general use in the south for several years, but the Bridal Veil Lumbering Co. was the first successfully demonstrating the feasibility ot this plan in handling the big trees on the Pacific coast. There is little doubt but this plan will be generally adopted in logging gulches where it would be to expensive to bnild logging roads, due either to natural obstacles or the limited amount of timber to be handled.

The above is reprinted from the Columbia River and Oregon Timberman, Portland, Oregon.

CARRYING LOGS ACROSS A CANYON WITH A WIRE ROPE.

THE BAND RESAW FOR THE SAW MILL.

In discussing the utility of the band resaw for work behind the big saw, either circular or gang, a prominent maker of resaws gave it as his opinion that it is not so much its rapid cutting for a limited time as it is to have a machine that will stand a moderate feed, say 50 to 60 feet a minute, and keep steadily at it. A high rate of feed involves more saws in a given time, more wear and tear during the actual cutting, and shorter life to the saws and machine. At the same time, the resaw would have to wait on stock for a third of its time, taking an ordinary run of logs. While the big saw is getting a log sawed into cants for the resaw, there is all the slabbing to be done, the bill and piece stuff to be worked out, and the cants, from two to eight pieces from each log, are to be sawed out of the way.

A resaw at a moderate feed will easily take care of this amount of stock, as it is not intended that the common run of boards shall be sawed on this machine ; but rather the better grades and wide stock for special bills. That is another feature of band saw practice that prohibits the using of fast feed. Any one who has had the chance to watch a band mill cutting can not fail to notice that the sawyer will slow down his feed in heavy cuts, even on heavy mills carrying 12-inch blades. For the big mill and wide and heavy blades to have to slow down the feed on heavy cuts, would indicate that it would be good practice to follow on a narrow blade, 6 inches or less, of lighter gauge and with less machine power and equipment.

What would be the gain to run a feed of 100 feet for three or four minutes and then let the saw run idle for the same length of time? Say a log 16 feet long would make eight cants to be resawed and it would take three minutes to saw up the log. This would take 128 feet for the resaw, just a little less than a minute and a half's work for the machine at a hard strain, and then wait for nearly twice as long a time to get some more stock. Now, on the other hand, suppose the logs should run to lower grades for two or three logs, your resaw is doing nothing and waiting to be put through its work on a uselessly high feed.

The fact that it can be done speaks well for the tool and is quite a consideration where the cants can be piled up on one side, to be run on extra time or at night, but the ordinary, every-day use of a band resaw is to run at such a speed and rate of feed as will keep cleaned up behind the mill, and any rate of feed over and above what it takes to do this is simply wasted effort and a useless wear on the machine.

Furthermore, the blades will be worn out faster in doing just the same amount of work, and the chances are the filer will have a hammering job on hand every time he fits up the saw, as the heavy work will keep the blade hard against the guide about half the time. This is all in reference to sawing stock in the mill right from the big saw, in many cases being flitch on both edges and ranging in width from 10 to 22 inches. A piece of flitch may be a foot wide on one end and 2 feet wide on the other, as this stock is to be taken ahead of edger.—H. E. Haner, in The Wood-Worker.

NEW SHINGLE MILL.

On May 26th last the shingle mill of the Spicer Shingle Mill Company, of Vancouver, B.C., was completely destroyed by fire. Steps were taken immediately to rebuild, and early in August the new mill was put in operation.

The new mill is a two storey frame structure 35 feet wide and 110 feet in length, with a detached boiler house measuring 32x68. The boiler house is constructed with an iron roof and iron sides. The mill itself and all the buildings are whitewashed inside from a recipe furnished by the Board or Fire Underwriters, and outside they are coated with special fire-proof paint.

The power for driving the machinery is furnished by three 60 inch by 14 feet boilers and an 18x24 slide valve engine. The mill is equipped with several Johnson-Schaake upright shingle machines manufactured in New Westminister. In addition there will be two cut-off machines for preparing the blocks and a special machine for shingle binders. The power is distributed from a four inch steel shaft which runs from one end of the mill to the the other. The capacity of the mill is 350,000 shingles in 24 hours.

EQUIPMENT FOR FOREST PROTECTION.

Mr. N. McCuaig, General Superintendent of the Forest Protection Service for district No. 1, in the Province of Quebec, makes the following suggestion in regard to fire ranging.

"A soldier on the battle-field without his rifle and ammunition is of very little account, and largely similarly situated is the best fire ranger, far away from help in the forest, face to face with his enemy—the fire—without any implements. Here are the articles that are articles that are usually employed in fighting fires, viz., spade, hoe and pail. There is little doubt if the Government offered a suitable reward to native mechanical ingenuity, a tool would be shortly forthcoming that would combine the spade and hoe in one implement and convenient for either purpose and not exceeding three and one-half pounds in weight. This, together with a rubber cloth pail, the whole at a trifle of expenditure, would constitute an equipment by which the ranger would be in a position at any moment to deal with a fire in its incipient or more advanced stage. The cost of such articles, including the leather belt, should not exceed three dollars per ranger."

One Copy, Weekly and Monthly, Six Months, in advance..... .50
Foreign Subscriptions, $2.00 a Year.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumbe trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

DRIVING OF HARDWOODS.

STREAM driving of pine, spruce and other softwood logs is accomplished without difficulty, the nature of the timber being such as to permit it to float. With hardwoods it has always been regarded as almost an impossibility to drive the logs any distance, owing to their weight and the tendency to absorb water.

The difficulty of driving hardwoods has been one of the obstacles in the development of the hardwood industry in this country. On many timber limits which have been stripped of the pine, there may be found large quantities of valuable hardwoods, which bave been regarded as useless by reason of inability to get them to the desired point for manufacture. Recently many experiments have been made to discover a method by which these hardwoods could be made to float satisfactorily, and it seems that at least a measure of success has been achieved.

From the opinions of Canadian lumbermen published elsewhere in this number, it will be seen that the matter has received no little attention, also that there still exists much skepticism as to the advisability of attempting to drive hardwoods, the great drawback being that the quality of the timber at the end of the log deteriorates while seasoning necessary to cause the log to float is taking place.

The most successful method of driving hardwoods is probably the one adopted by certain lumbermen of Maine, which is to cut the timber during the summer, skid the logs, and haul them upon the snow the next winter, and drive them in the spring, when they have become sufficiently seasoned to cause them to float.

Peeling the logs is another plan which seems to have been followed with some success by Canadian lumbermen. Mr. Irving, of Buctouche, N.B., has found little difficulty in driving hardwoods, his policy being to peel the logs in the summer previous to the spring driving season. Of course, the cost involved in peeling the logs must be placed against the utility of this plan. Mr. Irving relates a significant incident as to the finding of a number of hardwood logs in the bottom of a pond. Notwithstanding that they must have been there for twenty years, they were found to be perfectly sound.

To deprive the tree of the bark for three or four inches deep all round, near the butt of the tree, and to plug the end of the log, are other methods which have been employed with a measure of success.

The subject of driving hardwoods is a most interesting and timely one, and might with advantage be further discussed in these columns. The opinions and experiences of lumbermen generally are invited.

INSURANGE ON LUMBER PROPERTY.

IT is very questionable whether the Underwriters have not taken an unwise step in making the recent sharp advance in the rates of insurance to be charged hereafter on lumber property. If the insurance in the lumber business has been carried at a loss, as is claimed, it could only be expected that this would not continue. Business is conducted for pecuniary advantage, and if such is not the result it behooves the management of any business to endeavor in some legitimate way to bring about the desired change of conditions. The action of the underwriters is quite within their rights; but in our opinion is not altogether warranted by circumstances.

While lumbermen throughout the entire Dominion are affected, the question, so far as we know, has not been discussed in caucus except by the Lumbermen's Association of Ontario. The members of that organization contend that it is most unfair to advance the rate in the manner the Underwriters have done, and are at a loss to understand the system of rating on which the new schedule is based. It seems to disregard very largely the nature of the risk. No distinction, so far as the rate is concerned, is made between a water power mill and a steam mill, nor is any allowance made for the fire protection appliances with which a mill may be equipped. The insurance companies have, without visiting the mills to ascertain the nature of the risk, demanded from the lumberman increased premiums ranging in some cases above 150 per cent.

The hazard of a water power mill is necessarily much less than that of a steam mill. In the case of the former the material in and around the lower portion of the mill is invariably more or less damp, and, in some cases, saturated with water. There are many mills in which it is necessary to use rubber and gandy belting, the conditions being such as to make the use of leather belting almost impossible. With a steam mill having a battery of say four or five boilers, and with pipes running in and around the floor of the mill to operate the steam niggers, saws, etc., the position is different, and the danger from fire greater. Is it not a strange anomaly, therefore, that the Underwriters should place both kinds of mills on the same footing in respect to rating?

The advance in the rate on lumber especially shows a lack of consideration on the part of the Underwriters. The rate has been fixed apparently without regard to the hazard caused by proximity to the mill. It is admitted that lumber is not endangered from fire if placed 100 feet from the mill, yet the Underwriters allow a correspondingly lower rate on lumber according to the distance over 100 feet at which it is placed from the mill. This would seem to indicate that they regard the mill as endangering the lumber no matter at what distance the two may be separated, and if such is the case why should not a mill well equipped with power appliances be given a lower rate than a mill without such appliances, or a water mill where no fire is needed be given a lower rate than a steam mill?

According to the new schedule the average rate on lumber is perhaps about 3½ per cent. This rate, we understand, is higher than prevails in the United States, where the rate on all good risks is only 2 per cent. The companies there, we understand, require a space between each yard or dock, although sometimes they make exceptions to this rule. The statement was made at the recent meeting of Ontario lumbermen that companies doing business in both the United States and Canada will give a lower rate on lumber in the United States than in Canada. If such is the case, it would be interesting to learn the ground on which such discrimination is based.

The suggestion that the lumbermen should form an insurance company to carry their own risks brings up a subject which calls for the most careful consideration before action is taken. Nevertheless, we believe that if the present exorbitant rates are maintained, the lumbermen will find some method of protecting themselves from fire at less cost than if they should continue to insure their property under the present schedule.

It will no doubt be of interest to learn some particulars of the Lumber Mutual Fire Insurance Company of Boston, a company which was organized in February, 1895, and began wriring insurance in the following month. This company insures only lumber and woodworking plants, and is authorized to transact business in the United States and Canada. For the last three years the company have paid a dividend of 20 per cent., and the financial statement for the year ending July 31st, 1901, shows the company to be in a strong position. The dividends paid since organization have been $32,683.82, and the net cash surplus $42,862.96, making total profits to policy-holders $75,546.78. Another organization which is meeting with success in the lumber insurance business is the Lumber Underwriters at Mutual Lloyds, composed largely of lumbermen throughout the Eastern States. It is said that this company has succeeded in benefitting its members by a considerable reduction in insurance rates. From these facts it does not appear that the business of insuring lumber has been as unprofitable as the Canadian Underwriters would lead one to suppose.

DRIVING OF HARDWOOD LOGS.

A Successful Experiment in the Eastern States.—Experiences and Opinions of Canadian Lumbermen.

The question of driving hardwood logs is just now receiving more than usual attention, on account of what is claimed to be a successful experiment conducted during the past summer by certain lumbermen in Maine. It is understood that an entire drive of hardwood logs safely reached its destination, the loss by sinking not being more than in the case of pine and spruce. It seems that the logs were cut during the summer of 1900. They were then skidded, hauled upon the snow the next winter, and sent down the river in the spring. In the meantime they became seasoned, causing them to float. The seasoning process, it is understood, is facilitated by allowing the trees to lie for a week or so after felling before cutting them up into logs, as the leaves before drying up will draw nearly all the nourishment from the trunk.

The opinions of some Canadian lumbermen as to the successful driving of hardwoods were solicited, and are given below :

J. P. NEWMAN, Wiarton, Ont.: I have never had any experience in driving logs, but we raft hardwood logs from 30 to 60 miles in a loose boom. From the experience I have had in rafting hardwood logs I should think it would be a hard matter to drive them, as we find it very difficult to raft them unless it is with some lighter timber to which we can dog or wire them, as there is always a large percentage of the hardwood logs that will sink unless they are so floated up by lighter timber. In reference to cutting hardwood logs from the tree one season and holding them over until the next to season, I have found that unless hardwood logs are manufactured the same season they are taken out they will doze from six inches to two feet on each end, and to prevent this we always make it a point to have our hardwood logs all cut ou', as nearly as possible, by the first of September (rock and soft elm excepted.) I might say that not nearly so many logs sink if they are left on the shore six weeks or two months after spring opens.

A. HAGAR & CO., Plantagenet, Ont.: We have had very little experience in the matter, but we once bought some hard maple and birch logs to be rafted and delivered at our mill. The party got out some, but failed to deliver them, and we drove them the next year ourselves and were very successful, they being seasoned for a year. We only drove them a distance of about forty miles, but we did not lose one by sinking. Of course, there were only a small quantity, and we cut them up as soon as they arrived at the mill.

J. D. IRVING, Buctouche, N.B.: I have driven hardwood logs, all kinds, for the past fifteen years. They must be peeled the year before driving, and dried out fairly well. Of course, the drier the better, if they are to be on a long drive. They drive far better than spruce ; in fact, when you drive them with spruce they will run out ahead of the spruce and your drive will work much better. For instance, when logs begin to jam, if you can get any move out of them the hardwoods will be sure to go, whereas with spruce alone you frequently have to work them little by little until you get a good run out of them. The hardwood, as you may know, becomes as slippery as an eel as soon as it goes into the water. Regarding keeping them afloat any length of time, mine have been driven about 10 to 15 miles to a main rafting ground, and I have frequently had them remain in the raft all summer, in which case I throw a slop across the rafts and pin them to it. I always raft them with spruce or hemlock, which hold up the hardwood in the manner I have stated. I always watch mine, and when I see any beginning to sink pin them up. I think as a general thing they will remain above water without any trouble for two or three months, after that they begin to settle. My rafts come into salt water, which is, of course, a shade stronger than fresh. Anyone taking out a large drive of hardwood would have to avoid getting them stuck in the stream over summer, in which case they should be hauled or rolled out to dry. If they remained in the water over winter they would scarcely drive next spring. I cut away an old mill dam a couple of years ago, and in the bottom of the pond there were about 200 hardwood logs. They have been there about 20 years or more. I am having them hauled out on the bank to dry and drive next spring. They are as sound as the day they were cut in the woods.

THOS. A. PICKARD, Mar, Ont.: During the six years I was in business in Owen Sound, we cut from one to one and a half millions each year, all hardwood, and rafted all our logs. As to the success of rafting hardwood, we give it as our experience that if the water is smooth there is not more than 10 per cent. loss in rafting maple, beech and birch from forty to sixty miles, with logs cut during the winter and rafted the following summer from June to August. Have had no experience in running them on a stream, but in case of being caught in a sea you are sure to lose from 50 to 100 per cent. I don't think holding logs until the following season is practical, for if they are not in the water by August following the winter they are cut, they will spoil at the ends very quickly. We never adopted any method to keep them afloat, simply rolled them into "bag boom" and towed away at the rate of from one to one and a half miles an hour.

C. H. WITTHUN & CO., Wiarton, Ont. : Our experience with hardwood is that it cannot be successfully driven in small streams. We raft our hardwood logs after letting them dry for about four to six months, and then the best of the logs, "butt logs," will sink. The success of safely landing them at the mill depends entirely on the weather—if nice and calm we may get off with a small loss, but if rough we run large chances of losing more than twenty per cent., and if we are not very careful to keep in sheltered water, the chance of landing any of them is exceedly small. Then there is another drawback. If hardwood lays too long on the beach in the summer time the logs get dozed on ends, and the lumber is not worth within two dollars per M of what winter cut hardwood is worth.

J. R. BOOTH, Ottawa.: I have never had any experience in the floating of hardwood logs in the way you mention ; but to give my opinion I do think they would float if cut and laid up for summer for a short distance or until they became water soaked; but the greatest difficulty would be, I fear, in the sap wood becoming dozed in the warm weather, which I have found to be the case in some few I had left over in the woods by sleighing breaking up early in the spring before I got them out. I found all the logs that the heat of the sun got at were more or less sap dozed, whilst the bottom logs in the rollway were quite green, and I think would sink if put in the water the same as if put in from the stumps. Two years ago I put in the water 42 birch logs as an experiment, and only one of them reached my mill, and this one was in the water three months and barely floated ; the rest I never saw sight of.

KING BROS., Quebec, Que.: We have had very little experience in driving hardwood logs and are unable to make any suggestion, but the writer, in the course of conversation with some people coming from the lower provinces, gathered that the most successful plan had been found to deprive the trees intended to be cut of the bark to the extent of three or four inches in width all the way around the bottom of the tree, the effect of which is represented to be that the tree dies without injuring the fibre of the wood, and when cut the following year the tree is found drivable, that is, the wood is so dry that it will float without sinking.

W. J. TRENOUTH & BRO., Powassan, Ont.: The only hardwood logs we have driven is ash, elm, basswood and birch. Ash, black and white floats well. Basswood will float until the water gets warm. Rock elm floats well; soft elm will float well if it is good timber but a poor quality will sink. Birch will only float a very short time and we find it is the poor quality of it that sinks. We have been told that if the birch is peeled it will float, but we never tried any experiments in floating hardwood logs, but believe they will all float better if peeled.

J. & T. SCOTT, Allan's Mills, Ont.: We have been driving hardwood logs for a number of years, and would say that the logs are more successfully driven when they are cut a year before, but we sometimes cut them in the winter and drive them in the following spring, pinning cedars to them by means of 1½ inch oak or rock elm pins. A cedar log 6 inches in diameter at the small end will float an oak log about 18 or 20 inches.

THE ORILLIA EXPORT LUMBER CO., Orillia, Ont.: We have had considerable experience in the handling of hardwood logs, and we do not think that it would be practicable to cut them one season and float them the next. We will not say that they might not float, in fact we think that they would, but we think they would be so badly damaged by laying over, as to make them unfit for lumber and not worth much for anything else. It is a well known fact that hardwood logs such as we get here, with the exception of elm and ash, are materially damaged if they lay out of the water after the month of July following the winter they were taken from the tree, as after that date they deteriorate very fast.

A. & P. WHITE, Pembroke, Ont.: We have never had any experience in the driving of hardwood logs, but would be glad to know what steps can be taken to successfully accomplish that end, as we have a large quantity of hardwood on our limits, which is practically valueless unless we can devise some method of getting it down the river without sinking.

J. & T. JARDINE, Kingston, N. B. : We have had some experience with hardwood logs. We peel the bark off the trees and let them dry all summer, and the next spring they float all right. Some parties claim that the best way is, after the tree is peeled not to cut off the top until the fall when you commence hauling. They claim that the sap goes up into the unpeeled top, and thus lightens the butt of the tree. When logs are peeled we think there is no trouble driving them.

A. TAIT, Orillia, Ont. : Have no experience in driving hardwood logs, but feel quite certain that to cut and to hold hardwood logs over until they dry would render them useless for any manufacturing purposes.

CHEW BROS , Midland, Ont.: We have never undertaken the driving of hardwoods, outside of ash and basswood. This class of timber, if banked till driving season opens, can be driven the same season without any loss. Any hardwoods that we have sawn, such as oak, maple, beech, birch and elm, have not required to be driven, only towed, and in order to prevent such logs from sinking, we invariably resort to rafting as is customary in the trade. Our experience has been that it does not pay to risk towing without, as the loss sustained by logs sinking would much more than cover extra expenses incurred in rafting. Of course, this method would not apply where logs have to be driven down a stream, in which they would be likely to get broken up. We have not, in course of our lumbering operations, found it necessary to experiment in this connection, as principal part of our output is pine and floatable timber.

SNIDER LUMBER CO., Gravenhurst, Ont.: In reference to the driving of hardwood logs such as oak, birch and maple, we find that cribbing them is the safest and best way to drive them. Basswood and ash will float for a few months without losing any by sinking, while soft elm will float for some time. We have peeled soft elm logs in the spring, and after leaving on the bank for several weeks before dumping them found they floated high for several months. We think that cutting hardwood logs the previous season and allowing them to season would spoil them, as we find by leaving them on the bank until July the ends will be dozy from 1 to 1½ feet into the log. This is especially the case with basswood, birch, maple and beech, and cutting them a year in advance would, we think, render them useless.

N. & A. DYMENT, Thessalon, Ont.: We think that if

the logs were seasoned for a year, as you state, they would float long enough to be driven a reasonable distance.

ONTARIO LUMBER CO., Toronto, Ont.: We have had no experience in driving hardwood sawlogs in any appreciable quantity. We have occasionally driven oak timber, which would sink very readily when put into the water after cut. We found by boring a hole with a 3 inch auger at both ends of the log, and driving in a plug, leaving a small air space between the bottom of the auger hole and the plug, that they would float successfully in this way. We have known instances where hardwood has been left on the bank to dry, and by painting the ends of the logs just before watering, they were driven successfully, but the distance must not be too great.

MACPHERSON & SCHELL, Alexandria, Ont.: Your statement about cutting logs the previous season and allowing them to stand over and season would mean, so far as maple, elm and birch are concerned, to let them become useless. Maple and elm are damaged by September considerably, birch less. Seasoned logs may float until they become saturated. Plugged logs will float if the vacuum is perfect. Frozen logs will float early in the season, but will go down when the water is warmer and the logs become fully soaked, and the sap cells filled with water. Have tried floating hardwood logs but not successfully. The specific gravity of oak, maple and birch in a large percentage of logs is greater than water, and I do not see how such logs can float after the sap cells become filled with water. A large percentage of hardwood logs will float for a short time, but will go down after a few days.

PETER NADEAU, SR., Grand Cascapedia, Que.: In our district we drive very little hardwood of any description, the principal drawback in doing so being the sinking of logs coming down the river and also when in boom. The only safe and satisfactory way of driving them is by rafting them with spruce, cedar or pine. The logs are placed side by side, every second one being a spruce or cedar. Cross pieces are laid across at the ends and holes bored through the cross pieces and into the birch, then wooden pins are driven in solid. This is the only satisfactory way we know of, even if costly; otherwise there is sure to be a great deal of loss. The cutting of birch and hardwood the previous season is also a good way if the bark is taken off, giving the lumber a chance to dry; otherwise it will dry very little and in a few months will get dozy and stained.

WILLIAMSON & CROMBIE, Kingsbury, Que.: We have not had very much experience in driving hardwoods, but have got out ash, birch and basswood in small quantities, which were peeled in the summer and lay in the woods until the following spring, and then drove to our mills where they lay in the water until fall. These logs when taken into the mill and sawn were found in perfect order, and we have no hesitation in saying that logs got out in this way should turn out altogether satisfactory to the manufacturer. You, of course, understand that basswood got out in the winter is a great deal better than water-soaked timber, which becomes discolored.

J. B. SNOWBALL COMPANY, Chatham, N.B.: We have been in the habit of getting small quantities of hardwood off our small streams, and find that if peeled a season in advance, we are able to float the larger portion of them down our small brooks in the spring, but as soon as the water gets warm in the summer, they again absorb large quantities of water and sink. Our experience is that they can be handled for say three months after being put in the water in the spring. There is, however, more or less loss. Black-hearted birch will not float sufficiently at any time to pay for handling. We only have birch, maple, beech, ash, and this class of hardwood here, and our experimenting has been entirely with these, and our experience is that there is very little, if any, difference in the time we can keep the different kinds afloat. In preparing our stock in this way, we still find a few logs that will not float sufficiently, and we generally twitch these out of the brooks, and leave them over for the following year. Ours is a tidal river, and all our mills are on salt-water sites. In bringing hardwood logs from the delivery booms to the mills, we generally raft about one-half spruce and half hardwood, so as to make the passage (which is from 20 to 50 miles) in safety, but after arriving at the boom and the rafts being broken up, we find our loss is considerable, say from 5 to 10 per cent. All things considered, we could not recommend this mode of handling hardwood, and we only do it in case of necessity, and where timber and logs are not within reach of railway or other communication.

KELLEY BROS., River Hebert, N.S.: We have had no experience in driving hardwood logs. We should say that if the logs were barked all around they would not doze or sap rot and ought to drive alright. We think they would as well as sapling pine. Of course, the longer they stay in the water the heavier they get.

THE VICTORIA HARBOR LUMBER CO, Toronto, Ont.: We have never towed hardwood logs in any quantity. We have brought a few oak logs which had been cut and left one season on the bank, from French River to our mills, and towed them mixed with pine, and as nearly as we remember, we succeeded in getting about 50 per cent. of them to our mill. We would hardly consider that a success.

GILMOUR & COMPANY, Trenton, Ont.: We have never found driving hardwood logs satisfactory. We have only driven them a short distance from the pond to the mill, and in our opinion it would be almost impossible to drive them any distance, as so many of them would sink that the expense and loss would be very great.

M. BRENNEN & SONS MFG CO., Hamilton, Ont.: We had some birch logs peeled early last summer and floated this spring, and driven down the river. They floated very satisfactorily, but the timber appeared to be a little dozed, and would not like to say what the lumber will be like until we make a shipment. They were not cut into lumber as early in the spring as might have been, which perhaps would have been advisable.

UPPER OTTAWA IMPROVEMENT CO., Ottawa, Ont.: We have had practically no experience in driving hardwoods. We drive pine, spruce, tamarac, hemlock, cedar and occasionally a few ash, so few that we are not able to venture an opinion as to the percentage of loss. We handle about 3,000,000 pieces annually, among which are not more than 300 to 500 ash logs. We draw out and rollway for a year partly sunken logs wherever practicable, and thus avoid any appreciable loss. Of course, no amount of drying will make a shaky log float for any length of time, but sappy logs, if taken out of the water and allowed to dry for a year, float well.

THOMPSON & AVERY, Sharbot Lake, Ont.: We have found that by leaving hardwood logs on the bank for a short time in the summer, they will dry out enough to float for a short period, say two or three weeks, but to leave them on the bank for a season the timber taints in the ends of logs and the lumber is not so nice, besides, the logs will sink if left long in the water. We find by leaving birch, maple and basswood on the bank all summer the timber is almost spoiled. Elm will, however, not suffer even if left the whole season, and will float.

CRAIG & AUSTIN, Kinmount, Ont.: We have been experimenting on floating hardwoods for some years, and last year (1900) we made a success of it by falling the trees during the bark peeling season, from June 1st to August, peeling off the bark, and leaving the tree lie till the fall months, then cut and skid the logs and dump on the shores until the ice goes out in the spring. We believe any hardwood will float; we have swamp elm now floating like pine. We are peeling even our basswood this year.

JONES BROS., Wiarton, Ont.: Our experience is in rafting, not river-driving, but we presume the action is the same in both cases. We raft hardwood logs at all seasons of the year. Early in the spring many of them sink, and even at this season some will sink, after lying on the shore all summer. Wherever possible we dog, or wire sinkers to logs floating high, and this is the only means used in this section to bring them in. To dog or wire up logs would not be practicable in river-driving. We never tried cutting logs the previous season, but would suppose that if they were cut very early, that the most of the logs would be completely ruined for lumber. For instance, any hardwood logs left on the shore a season would not be worth rolling into the water. Any hardwood logs cut, say last winter, and left in the sun until the end of August, would make lumber that most dealers would not buy at more than half price. The lumber would be dozy.

MAITLAND, RIXON & CO., Owen Sound, Ont.: We cannot speak with any authority whether the hardwood can be driven successfully or not down streams, as we have never had any experience in driving hardwood logs, as all our logs are drawn to the shore and rafted from there. But one part of your letter struck us as something peculiar, that is the holding of hardwood logs for a year to dry them out to run them down stream. Hardwood logs in our part of the country, if held for a year, are spoiled. Hardwood in the eastern states must be different to what ours is. Our opinion of running hardwood logs is that it cannot be done successfully.

PITTS & CHARLTON, Victoria Harbor, Ont.: We have had no practical experience in the driving of hardwood logs. We have heard that cutting the previous season, and allowing them to remain over a season, would likely produce the desired results, that is, to prevent sinking. We would give it as an opinion that if hardwood standing timber were girdled, say during the winter season when the sap is down, and in effect killed, and then cut into saw-logs the following season, as we are informed is the practice with cypress, this would be found advantageous.

J. MCBURNEY & SONS, Callender, Ont.: We have never tried driving hardwood logs with the exception of basswood, which we find sink if left in the water long. It is claimed by our men that if bored four or five inches in the end and plugged basswood logs will float, but we have never tried it.

THE PEMBROKE LUMBER CO., Pembroke, Ont.: We have had no experience in handling hardwoods in the manner you state. Any hardwoods we have taken down were loaded or banded to other floatable logs. The writer is of the opinion that hardwood logs held over in the woods for a season will float the following April and May, or for such time as the water is heavy.

REID BROS., Hepworth Station, Ont.: Cutting hardwood logs and leaving them over for a season spoil them entirely for first-class lumber, as there is at least two feet on each end spoiled. We have not had any experience driving hardwood logs, but keep our logs in mill pond at one of our mills, and find they are easily kept afloat. They are usually wired to soft logs and can be floated on the lake without any loss in good weather. Driving on the river has not been accomplished successfully here.

H. CARGILL & SON, Cargill, Ont.: We have driven some hardwood logs without any special preparation, but not successfully. They might be driven successfully as you suggest, but we find they spoil very quickly and think a good deal of timber would be wasted if cut the previous season. We find hardwood logs cut along in September will spoil or rot to some extent at the ends before it can be sawn in the winter. Coming through Windsor on the train a few days since the writer noticed hardwood logs being unloaded off cars and made up into rafts in the river.

R. WATT, Wiarton, Ont.: My experience has been that if hardwood logs are held over more than one season they doze at the ends and sap-rot and become practically useless. I raft my logs here, but do not commence before about the first of June, and between that time and the middle of July they should all be watered, otherwise they commence to doze. The majority of them will float, but when we get what we call sinkers we usually wire them to a softwood log. If the spring happens to be late and cloudy the logs do not spoil so soon.

CANADA LUMBERMAN

WEEKLY EDITION

The Lumberman Monthly Edition, 20 pages} $1.00 PER YEAR {The Lumberman Weekly Edition, every Wednesday

THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN, THE UNITED STATES, AND OTHER FOREIGN MARKETS.

VOL. VII. TORONTO, ONT., SEPTEMBER 4, 1901 No. 31

CANADA LUMBERMAN

PUBLISHED BY

The G. H. Mortimer Publishing Co'y of Toronto, Limited

Confederation Life Building - TORONTO.

Branch Office:
IMPERIAL BUILDING, MONTREAL.

Weekly Lumberman, published every Wednesday. Contains reliable and up-to-date market conditions and tendencies in the principal manufacturing districts and leading domestic and foreign wholesale markets: A weekly medium of information and communication between Canaian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

WANTED AND FOR SALE

FOR SALE.

About 3½ million feet of White Pine, mill runs ½ million feet dry; cut last August. Address,
W. G. DOHERTY, Day Mills, Algoma, Ont.
or
W. DOHERTY & CO., Clinton, Ont.

FOR SALE OR EXCHANGE.

SAW MILL, COMPLETE, 40 H.P., CAPACITY 15,000 ft., Double edger. Apply to MCCALL MASON, St. Williams, Ont.

TO BOX SHOOK MANUFACTURERS

A superintendent of large sawmill and box factory, from Glasgow, desires position; first class references. BOX 24, CANADA LUMBERMAN.

For Sale

VALUABLE TIMBER LIMITS, SITUATED at Carleton West P.Q., well wooded with Spruce, Cedar, Hardwood, etc., together with Rotary and Shingle Mill, Sleds, Trucks, Horses, Camping Outfits, etc. For further information apply to R. J. MILLER, River Charlo, N.B.

SLABS, SLABS.

FOR SALE, OUR SEASON'S CUT OF PINE Slabs. A quantity ready for present shipment Please send tenders. HUNTSVILLE LUMBER COMPANY, Limited, Huntsville, Ont.

Auction Sale of Timber Berths

PUBLIC NOTICE is hereby given that pursuant to authority of Orders in Council, the Red and White PINE TIMBER in the following townships in the DISTRICT OF ALGOMA, namely:—The Townships of GRAHAM (part), HART, CARTIER, LEVACK, JARVIS, ANDERSON, CHESLEY, GILLMOR, WHITMAN, CURTIS and RUTHERFORD (part), and certain areas between the PIGEON RIVER and the ARROW RIVER waters in the District of THUNDER BAY, will be offered for sale by Public Auction at the Parliament Buildings, in the City of Toronto, on TUESDAY, THE SEVENTEENTH DAY OF SEPTEMBER NEXT, at the hour of one o'clock in the afternoon.

At the same time and place certain forfeited and abandoned Berths in the Townships of DIGBY, SHERBORNE and LUTTERWORTH, in the District of HALIBURTON and County of VICTORIA, will be offered for sale, the purchasers of these latter Berths to have the right to cut all kinds of timber.

Sheets containing terms and conditions of sale and information as to Areas and Lots and Concessions comprised in each Berth will be furnished on application, either personal or by letter, to the Department of Crown Lands, Toronto, or the Crown Timber Agencies at OTTAWA, SAULT STE. MARIE and PORT ARTHUR.

E. J. DAVIS,
Commissioner Crown Lands.

Department of Crown Lands, Toronto, June 1, 1901.

N. B.—No unauthorized publication of the advertisement will be paid for.

FOR SALE

Circular Sawmill, in good hardwood locality; also Shingle and Lath Machinery. Profitable local and custom trade. Snap for man with small capital. Address BOX 37, CANADA LUMBERMAN

FOR SALE

SAW AND PLANING MILL FOR SALE Good locality, going concern. Good reasons for selling Apply Box 26, CANADA LUMBERMAN.

FOR SALE — 600,000 FEET GOOD WHITE Pine Mill Culls, Dry. Address "OTTAWA," office CANADA LUMBERMAN.

FOR SALE.

Eighty thousand feet Cedar Squares 4 in. x 4 in. to 12 in. x 12 in. Can load on cars at Wiarton or Vessel at Golden Valley, (Lake Huron) as required.
T. A. PICKARD,
Mar P.O.

FOR SALE.

A number of very valuable pine and other timber limits on the north shore of Lake Huron and elsewhere for sale. Also limits bought and sold on commission and estimates given. For particulars, apply to
P. MCDERMETT,
Box 177, South River, Ont.

For Sale or Exchange

For pine lumber, full set of barrel hoop machinery. Apply to
JAMES GRAYDON, Jarvis, Ont.

FOR SALE.

About 120 M. ft. pine lumber cut 1" and 2" and 10 M. ft. spruce cut 1".
Prices and particulars on application.
THOMAS BOWSER, Kagawong, Ont.

AUCTION SALE

Timber Berths

NORTH SHORE OF LAKE HURON

Modern Sawmill, Etc.

The undersigned has been instructed to offer by public auction, in the Rotunda of the

BOARD OF TRADE, TORONTO,

AT 2 P.M. ON

FRIDAY, NOV. 15TH, 1901

the following properties:

Timber Berths 60, 61, 119 and McKinnon Townships;

also the modern and well-equipped

Saw mill, buildings and plant situated at Sturgeon Bay, on the Midland branch of the Grand Trunk Railway.

For further particulars, maps, terms, etc., apply to Tanner Bros., Waubaushene, or to
PETER RYAN, Toronto.

FOR SALE

50 M. feet dry Red Oak 1 in. thick; 120 M. feet dry Pine, 1 in. and 2 in. thick, mill run, culls out. F.O.B. cars, Dayton Station, C.P.R. Inspection at mill. JAMES I. HARRIS, Day Mills P.O., Ont.

WANTED

A first class sawyer to run a circular saw cutting largely in dimension timber. Apply to
A. & P. WHITE,
Pembroke, Ont.

WANTED

FROM ONE TO TWO HUNDRED M FEET of Basswood Lumber, 1 inch, to grade common and better; either dry or will contract for lumber to be cut.
The M. CAMPBELL FANNING MILL CO.,
of Chatham (Limited)
CHATHAM, ONT.

FOR SALE

Retiring from Business on account of old age.

Old and well established wholesale hardwood and pine lumber business, both Canadian and export trade with Great Britain and the United States, to steady customers of the highest standard. Several orders now on hand and stock now getting ready. Apply to
J. F. SANGSTER,
Real Estate Agent,
Richmond Street, London, Ont.

CURRENT TRADE CONDITIONS.

ONTARIO.

From the standpoint of immediate demand, white pine lumber conditions are not as satisfactory as they were one month ago, the volume of business being slightly less. But when this is said nothing more can be added which would give one reason to expect anything but a strong market. The conditions are all favorable to a steady demand at firm prices. The present season has been characterized by extreme dullness in the export of lumber, but next year a season of much greater activity and higher prices may be looked for. As it is the higher grades which most readily find a market in Great Britain, there is likely to develop a great scarcity of these grades in the near future, especially as the supply is now almost inadequate to meet the demands of the trade. Good pine lumber promises to gradually become more valuable. The changes in our Ottawa price list show an appreciation in good strips and shipping culls and better. Lath and shingles are also showing strength, and it is said that the supply is very light. Toronto dealers are looking for still higher prices before the end of the year. Of hardwoods little can be said. The buying is still of a hand-to-mouth character, while manufacturers are holding prices steady. The stock is comparatively large, but this will be offset by restricting the log output next winter. There is a good movement of hemlock.

QUEBEC AND NEW BRUNSWICK.

Lumber market conditions in the eastern provinces are mostly unchanged, although there are indications of strength. Waney pine has been sold in the Quebec market as high as 55 cents for 21 inch average. The other classes of timber are firm, although not in as good demand as pine. Spruce deals are moving moderately, while clapboards are scarce and firm. As high as $32 has been paid for extra quality clapboards delivered at Boston. The cedar shingle market is daily becoming stronger, and several sales of extras are reported at $3 on Boston rate of freight. Clears bring about $2.70 and second clears $2.25. A recent report from Fredericton, N. B., states that there are 26,000,000 feet of logs hung up on the head waters of the St. John river owing to extremely low water. This is about one-fifth of the output of that river.

MANITOBA AND BRITISH COLUMBIA.

The carpenters, strike in Winnipeg is perhaps, the only unfavorable element in the lumber situation of the west. Other conditions favor a large consumption of lumber. Building permits issued in Winnipeg up to August 31st of this year represent an expenditure of $1,300,000, and the total for the year will probably exceed two million dollars. Then there is the abundant harvest to enrich the farmers and make possible the erection of new buildings and improvements. Altogether the outlook for lumber is good, and prices are firm. British Columbia manufacturers report some increase in the demand for shingles for shipment eastward, but the movement of lumber is not very active. A few large orders have lately been placed for railway and bridge timber.

UNITED STATES.

The lumber trade of the United States has been a little quieter during the past week, although prices show no material change. The tendency seems to be towards higher prices for the upper grades of white pine, and a continuation of present prices for the lower qualities. In the Lake Superior district uppers and selects are higher, and in Tonawanda some of the better grades have been marked up two dollars per thousand. The selling price of white pine in the eastern distributing markets has for some time been out of proportion to the prices asked at producing points, and a process

of readjustment is now taking place. There is a marked scarcity of 12 inch boards and long piece stuff. The spruce market continues firm, a report from Boston stating that the list price has been advanced one dollar. It is most difficult to arrive at a definite conclusion regarding the hardwood situation. Indications point to an increased demand, while on the other hand many dealers report a very quiet trade, and basswood, which has been strong all year, has been offered at reduced figures. This has given consumers reason to hope for concessions and consequently they are showing a disposition to keep out of the market as long as possible. Inch maple is inactive, but there is good demand for thicker sizes. White pine shingles are scarce and strong.

GREAT BRITAIN.

The past two weeks has witnessed a falling off in the number of timber cargoes arriving in London, and consequently a more hopeful view is now taken of the timber market of Great Britain. If shipments are curtailed, the market will very soon show signs of recovery. So far as Canadian spruce and pine are concerned, it is significant that they appear to occupy a stronger position than any other class of lumber which is marketed in Great Britain. A quantity of third quality Ottawa pine, 70 per cent. 3x11 and balance narrow, is reportd to have been sold at £11 10s. per standard delivered at Liverpool. Considerable parcels of spruce have also changed hands, and when dealers are enabled to reduce their holdings purchased at the higher level which prevailed in the spring, liberal buying for fall and winter account may be expected. A large line of Quebec spruce battens were sold at a recent sale in London at £6 17s. 6d. per standard for 3x7, and £6 7s. for 3x6. Quebec rock elm boards sold at 9d. per foot and birch planks at 1s., and square elm timber at 60s. to 67s. 6d. per load of 50 cubic feet. Quebec oak is in fair request, and the demand for first-class waney and square pine is good, but second-class is dull of sale. The consumption of wood in London is increasing and is in excess of same time last year.

STOCKS AND PRICES.

W. Caldwell, of Toronto, is announced to have sold within the past fortnight 4,100,000 feet of white pine lumber to W. H. Hogg, of Buffalo.

The Yale-Columbia Lumber Company, of Phœnix, B. C., is supplying about 750,000 feet of lumber for a large tunnel on the new Boundary railway.

A car load of shooks for fruit boxes and berry baskets was shipped last week from New Westminster, B. C., to Adelaide, Australia, by the British Columbia Mfg. Company.

The schooner F. E. Saunders is loading lumber at the Hastings mill, Vancouver, B. C., for a foreign port, and the ship City of Hankow is about to load lumber at Barnet, B. C., for Sydney, Australia.

Messrs. Robinson, Limited, held a sale of wood goods at Dublin, Ireland, on August 15th, at which the following prices were realized: Miramichi spruce, 9 x 3, 10 and 11 ft., £12 15s., per Irish standard; 12 ft., £13 2s. 6d.; 13 ft., £12 15s. to £13 2s. 6d.; 14 ft., £13 5s.; 15 ft., £13 2s. 6d.; 10 ft. to 19 ft., £13 5s.; 20 and 21 ft., £13 7s. 6d. Cape Tormentine spruce, 12 x 3, £12 to £11 5s. 11 x 3, £12 5s.; 8 x 3, £11 17s. 6d.; 7 x 3, £11 12s. 6d.; 5 x 1, £9 2s. 6d. 1st Quebec spruce, 9 to 14 x 3, £14 5s.; 2nd, 11 to 14 x 3, £13 17s. 6d.; 7 x 3, £12; 3rd, 9 x 3, £11 10s.; unsorted, 7 x 3, £11 10s. to £12; 9 x 3, £13. Quebec red pine, 18 ft. 4 x 2, £14 7s. 9d. to £14 15s.; 20 ft. to 24 ft. 4 x 2, £14 10s.; 18 ft. 6 x 2, £15; 12 ft. 9 x 3, £19 1s.

Messrs. Campbell, Meredith & Allan have entered an action in the name of the Collin's Bay Rafting & Forwarding Company to seize and attach in the hands of Messrs. Poupore & Malone, contractors, now doing work in the Montreal harbor, some 1,060 pieces of oak now on board the steamer Saturn or on the wharf, to which the steamer is attached, the whole representing a value of about $13,350. The affidavit of the President of the company plaintiff, which owns the Saturn, sets forth that the timber was shipped at Sandusky, Ohio, consigned to the defendants by Hirk, Christy & Co., of Cleveland, and that on coming to Montreal the ship grounded at Pigeon Island. A tug and lighter had to be secured to release the vessel, and the time lost and repairs needed constituted another source of damage. The plaintiffs claim that the accident is imputable to the cargo, and that they have a lien on the timber.

FIRES.

The saw mill of Thompson & Avery, near Sharbot Lake, Ont., was destroyed by fire on August 29th, at a loss of $4,000.

The saw mill of John Greenlees, at Red Bay, near Wiarton, Ont., was burned recently, together with a quantity of lumber.

THE OTTAWA VALLEY.

[Correspondence of the Canada Lumberman.]

Prices on the local lumber market hold firm, no single line showing a break or tendency to break. The local demand has improved with the passing of the labor troubles. On account of the strikes, however, considerable building planned for the present season has been postponed a year. Culls are now a good feature, as the supply is limited. They are almost entirely in the hands of jobbers, according to a reliable authority.

Opinions differ on the export trade, but the American market from all accounts shows little, if any, improvement. One company has it that the United States buyers are trading from hand to mouth. September, however, promises an improvement, as winter stocks will then begin to receive attention. The British market is dull and according to report overstocked. British exporters, while moving considerable stock from local yards and mills, are holding considerable on the other side.

Quotations show advances in a few lines. Good pine strips have brought from $26 to $32 per thousand. Pine 8 inch shipping culls and better stock finds buyers at $15 to $16. Lath are in demand, No. 1 unchanged at $2.00 to $2.50 and No. 2 advanced to $2.25. Cedar shingles have also reached a higher figure. Clear butts are mentioned at $2.00 to $2.35, and XXX at $2.50 to $2.75. Mill culls are retailing as high as $14.

"Hardwood trade extremely dull," is the situation as described by a local dealer. Buyers are not anxious for business and the mills are holding large stocks. Prices, however, are erratic and what holds good in one sale may not answer in another, although the same stock may be selling. The figure given for basswood is $16 per M., and for mill run ash $17. Maple, birch and elm, which brought $16 a year ago, are running from $10 to $12 now.

Business is brisk at the mills and logs plentiful. Low water in the Gatineau threatened a tie up, but heavy rain has improved the situation.

Over 800 men have gone up to the woods. Some place the figures even higher, and gangs are being hired daily. Wages are even higher than last season, ranging from $20 and board for road-making to $30 and board for axe men.

It is reported that the Bronson & Weston Company will next season erect a saw mill at the Chaudiere, on the site of their old one. They have been out of the business for a couple of years.

When the Duke of York and Cornwall and party arrive in Ottawa they will see lumbering operations in the picturesque

—CORRESPONDENCE SOLICITED—

setting of a quarter of a century back, before work on the limits was modernized. A cabin is to be erected at Rockliffe, near Ottawa, in which no nails or other iron will enter. Bunks and open fire-place will adorn the cabin. At least twenty-five trees will be felled, trimmed and run to the river. The lumbermen will do their own cooking and everything is to be carried out as in the by-gone days. Before visiting the cabin, the Royal party will shoot the slide. The local lumbermen have entered with enthusiasm into the scheme.

Ottawa, August 30, 1901. A. P.

BUSINESS NOTES.

A meeting of the creditors of the Chequasset Lumber Co. was held in New York on August 27th. Representatives of all the banks interested as well as the merchandise creditors were present. The meeting was called at the request of Chas. E. Corkran, president of the Chequasset Lumber Co., who made a proposition to form a new company, of which he was to have control, to take over all the assets and liabilities and continue business. The Chequasset Lumber Co. is a parent organization controlled by fifteen subordinate companies. Mr. Corkran submitted a statement showing that the liabilities of all the concerns amounted to $965,960, and the assets would amount to nearly $500,000.

A committee of three creditors was appointed to examine the books and to report to another meeting, which will be called in about three weeks.

CANADIAN LUMBER SHIPMENTS.

The following shipments of lumber, etc., from Canadian ports are reported since last issue:

From Chatham, N. B.: Schr. Morancy, for New York, 1,106,500 pieces lath, by William Richards Co.

LUMBERMEN'S ASSOCIATION OF ONTARIO.

A special meeting of the Lumbermen's Association of Ontario was held in the Board of Trade Building, Toronto, on August 15th, Mr. John Waldie, the President, in the chair. Various matters of interest to the lumber trade were discussed.

The President explained that the Board of Management had not seen their way to affiliate with the Canadian Manufacturers' Association. That Association desired that, in respect to an import duty on lumber, an exception should be made in the case of hardwoods, and that these should be admitted free. To this proposition the Lumbermen's Association would not agree, as it is the desire of the lumbermen that all lumber imported from the United States should be subject to a duty.

The Secretary, Mr. Tyndall, brought up the question of union labor in respect to the loading and unloading of boats. He said that a freight handler's union had been formed, and that their demands were such as to seriously affect the interests of all shippers. While they demanded the same wage scale as was paid in Chicago and similar places, they were not willing to give an equal service with these cities.

The question of wages of men in the woods was then discussed. It was shown that wages have been steadily increasing for the past four years, and that the cost of supplies is also higher. This brought up the question of restricting the log output during the coming winter. Mr. John Bertram stated that they had had three years of fairly good prices for lumber, and he thought it would be unsafe for the lumbermen, when they had to pay such high prices for pork, oats, etc., and such high wages, to go on and force their business.

It was pointed out that there was much difficulty in greatly curtailing operations, as it was almost necessary, where there was a large investment in plant and where an operator was the owner of a large number of horses, to provide employment for such plant and horses.

Mr. N. Dyment, of Barrie, stated that it was his intention to curtail operations in the woods the coming winter to the extent of 50 per cent.

The President remarked that in the winter of 1897-98 wages were about $16 per month, but in 1899-1900 they were $27. He thought that it now cost about $7 per thousand feet to get logs out of the woods and into the booms. Pork was 40 cents higher than one year ago.

A general discussion followed on the cost of taking out logs and manufacturing lumber. In logging labor was said to represent about 55 per cent. of the cost, while the average cost of manufacturing lumber, including saw bill, repairs, piling, etc., was about $2.

The following resolution was then submitted and unanimously adopted :

"Moved by Mr. N. Dyment, seconded by Mr. C. Beck, that in view of the present conditions attached to the carrying on of the lumber business, the increased value of stumpage, the difficulty of procuring suitable labor, and the uncertainty of demand for the product, the members of the Lumbermen's Association are of the opinion that it is very desirable to decrease the quantity of logs to be taken out next season, and those present agree to curtail their operations, and advise that all the members of the association follow this course, and so conserve their timber holdings."

Mr. Bertram endeavored to impress upon lumbermen the necessity of following the policy above outlined. It seemed to him that it would pay lumbermen better to consider their holdings of timber in the nature of an investment, and to extend their operations over ten years rather than to cut out their limits in half that time. He referred to the good fortune of the present holders of white pine timber. In about five years, he said, all the merchantable white pine on the south shore of Lake Superior would be cut, and Canadian owners of white pine, after that time, would certainly reap the benefit.

Mr. George Thomson, of Goderich, said that the timber in the north of Michigan would be completely exhausted in five years.

The President brought up the insurance question. He characterized the action of the insurance companies in respect to the recent advance in rates as most arbitrary and unjust. For instance, a water power mill with a first-class steel burner had been advanced in equal proportion with a steam mill with a poor burner. The underwriters had made a scale based on the distance the lumber is piled from the mill, without regard to the character of the mill, style of burner, or yard arrangements. If an advance was necessary, he thought it should have been a percentage instead of a flat advance.

Mr. Bertram said that his mill had been standing since 1852, and for nineteen years he had paid insurance premiums without ever having a fire either in mill or lumber yard, yet his insurance had been raised from 1¾ to 4 per cent.

Mr. Charles Beck proposed that the lumber-

Canadian Pavilion, Glasgow Exhibition.

men should carry their insurance among themselves. He thought that by this means they would get cheaper insurance. The advisability of affiliating with the Millers' and Manufacturers' Association was suggested, and on the motion of Mr. Bertram, the following resolution was adopted :

"Resolved, that the recent advance of rates of insurance on lumber, ranging from 50 to 225 per cent., is, in our opinion, not warranted by the circumstances, and the Board of Management are requested to communicate with saw mill owners, whether members of the association or not, with a view to taking joint action, either in forming a new insurance company by associating themselves with other manufacturers, and so dividing the risk, or by joining on favorable terms some existing institution ; that the Board of Management report as soon as possible to a meeting to be called for the purpose, and take action with a view of remedying the present abnormal conditions."

Mr. Dyment stated that it was possible to obtain from the same company cheaper insurance for lumber in the United States than in Canada.

The President referred to the action of the Ontario Government in passing an order-in-council compelling the medical inspection of lumber camps. This order was passed last winter and took effect on September 1st.

Those present were unanimous in condemning the regulations, which they thought to be unjust. One of the gentlemen present stated that not a case of smallpox on the north shore had originated in the lumber camps, but that it had been carried from the Michigan Soo and distributed from hotels along the C.P.R. Some striking comparisons were made between the conditions under which the men in the woods and people in the large cities live, the opinion being expressed that much greater need exists for a compulsory inspection of dwellings in cities than of the camps in the woods. It was also shown that the regulations requiring the men to take out certificates of freedom from smallpox were improperly carried out, and that it was simply a means of adding to the revenue of doctors. No action regarding the order-in-council was taken, but it is probable that the matter will be considered by the Board of Management.

The lumbermen have experienced some annoyance from "jumpers" from camps after their expenses had been paid. It was pointed out that there was a law to protect employers, but that it was often found inadvisable to enforce it. This law is an amendment to the Act Respecting Master and Servant, and reads as follows :

The Act Respecting Master and Servant is amended by adding thereto the following section :

"In case any person enters into an agreement under which he receives as an advance of wages, money, food, lodging or railway or steamboat ticket, to enable him to reach any place at which he has engaged to perform labor, work, or other services, if such person thereafter, without the consent of his employer, leaves his employment before the money or cost of such food, lodging or transportation has been repaid, he shall, on proof thereof before a justice of the peace, be liable on summary conviction to a penalty not exceeding $25 ; and in default of payment of such penalty to imprisonment in common jail of the county or district for a period not exceeding thirty days, as the justice may direct."

A general discussion followed respecting the price of lumber, after which the meeting adjourned.

AMERICAN FORESTRY ASSOCIATION

THE summer meeting of the American Forestry Association was held at Denver, Colorado, on August 27th, 28th and 29th. There were two sessions daily and an open meeting on the evening of the 28th, at which Mr. Gifford Pinchot, Forester of the United States Department of Agriculture, gave an illustrated lecture entitled "The Government and the Forest Reserves."

Altogether, the meeting was very successful, about twenty papers on subjects pertaining to forestry being presented.

One of these was by A. D. Hopkins, on "Insect Enemies of Forests and Forest Products." The author briefly reviewed the subject of insect enemies of forests and forest products, and its relation to the scientific methods of forest management, giving as examples the ravages of the chesnut timber worm, the oak timber worm, the spruce destroying beetle, and certain enemies of the forests of the north-west, which, by the adoption of improved and inexpensive forestry methods, may be controlled, so as to prevent the loss of a vast amount of timber. Doctor Hopkins also referred to insects injurious to forest products used in railroad construction, and methods of preventing losses ; insect enemies of stored hemlock and oak tanbark, and the simple remedy suggested by a knowledge of the habits of the pest. He also spoke of the difficulties met with (owing to insufficient funds and assistance) in conducting the elaborate experiments necessary to determine important facts relating to the life and habits of the more destructive species, and to demonstrate the practical application of results.

Doctor Hopkins also presented a paper on "Forest Conditions in West Virginia." He related the observations made during a recent trip through the forest areas of the state of West Virginia, which furnish (in their varied conditions of primitive growth, extensive lumbering operations, exhausted supply of merchantable product, depredations by fire and insects), some of the leading problems, which are so important to study, with a view of determining scientific methods of management and protection. He referred to the fact that the harvesting of the forest crops, which represent one of the important natural resources, continues unabated ; but called attention to the marked difference (from the old method of culling out the best timber for special purposes), in the present utilization of all kinds of available products in one operation. Thus a clean sweep is made, and little is left for the forest fires, except the debris. In most sections, the conditions are favorable for a profitable second growth forest. An example of what a natural second growth will do, under utter neglect, is had in an area of several thousand acres denuded some seventy to one hundred years ago, to supply charcoal for iron furnaces, which is now yielding a vast quantity of chesnut telephone poles, locust pins and other minor products. Much encouragement is found in the fact that some of the wealthiest owners of extensive forest areas are beginning to consider and apply improved scientific methods in harvesting matured products, providing for the perpetuation of a profitable forest growth, and encouraging the reforestation of the denuded areas. Doctor Hopkins mentions one of these public spirited men, who although eighty years old, is contemplating the extensive planting of acorns for a future supply of railroad ties.

In a paper on "The Reforestation of Watersheds," T. P. Lukens said that the depletion of forests caused extremes of flood and drouth, as shown by the present conditions in Southern California as contrasted with the same area prior to the inroads of unrestricted sheep and cattle grazing, wasteful methods of lumbering and destructive fires. Originally the mountains and valleys were well forested and the streams flowed continuously. The effect of these abuses is seen in the decreased flow of streams, and the rapid deterioration of the originally productive soil. The remedies proposed are the absolute prohibition of grazing, except within fenced areas, the employment of rangers to guard against fires, and to enforce the grazing regulations, and the inauguration of improved methods of lumbering under trained foresters.

"The Progress in Tree Planting" was treated by William L. Hall. The past year, he said, has been notable for the planting of timber. Never before were so many trees planted in a single year. The work is not limited to the plains but extends throughout the Mississippi Valley and to the Atlantic States, where some of the largest operations are now in progress.

In the west besides for general utility many plantations have been established as investments and have proved profitable. Their success has influenced more extensive planting for the same purpose. Eastern planting has two purposes in view. First, to utilize worthless ground. Second, to protect water supplies. For these purposes extensive planting is now being done. Both in the east and in the west the planting problem is being studied to develop cheaper and more rapid methods, for on cheapness and rapidity will depend the importance of planting in American forestry.

IMPROVE YOUR BUILDINGS.

Messrs. W. A. Fleming & Company, 771 Craig street, Montreal, have recently concluded arrangements for the general distributing agency for the famous Lythite Cold Water Paint and National Wall Coating. Lythite, although only a dry powder, when mixed with cold water, is claimed to produce a perfect paint, suitable for both interior and exterior work. It is made in white and black and 24 colors. White Lythite is the whitest white paint made, and is very valuable for the interior walls and ceilings of mills and factories, railway buildings, engine-rooms, store-rooms, elevator shafts, area-ways and hosts of other places where the greatest possible amount of light is required. Messrs. Fleming & Company state that this paint increases the light and reduces insurance wherever used. It costs about one-fourth the price of oil paint. For use on calcimine and plastered surfaces, one of the best materials is National Wall Coating. This wall coating, the agents state, has great covering power, will not run, lap or show joints and possesses great sanitary properties. W. A. Fleming & Company will gladly send color cards and all the facts about these valuable products upon request.

THE HOE CHISEL-TOOTH SAW

It is hardly necessary to describe to our readers the general features of the Hoe chisel-tooth saw ; its merits are already well known. For many years it has been the endeavor of the bright minds to invent something better than the Hoe chisel-tooth, but it seems as though the master mind which conceived this article went at once to the bottom of simplicity, which is the true element of success in a tool of this kind. The design of the Hoe chisel-tooth is something that can be grasped at once, and a child may readily understand its mechanism. To this simplicity is added a perfection which gives the tooth all the rigidity of that of a solid saw, combined with the advantages of a removable tooth.

Messrs. R. Hoe & Company have spared no expense in the constant perfection of this remarkable tool, and every succeeding year produces a better article than that produced the year before. No material is allowed to pass into the manufacture of these saws, bits and shanks without first being subjected to the most rigid tests in the various stages of manufacture.

There are now, we are informed, over 35,000 of the Hoe chisel-tooth saws in successful operation, not only throughout the United States and Canada, but in Great Britain, Australia, New Zealand and other British colonies, West Indies, Cuba, Mexico, Central and South America, Russia, China and Japan ; in fact, wherever lumber is marketed. They cut accurately any kind of timber from pine to lignum-vitae and are especially successful in frozen timber.

TIMBER ESTIMATING.

Timber estimators have, as a rule, been reticent concerning their methods. Their employers, who buy and sell on their estimates, do not ask them.

As long as those immediately concerned are content, there is no need of literature on the subject ; but when the value of the property of people inexperienced in sales by estimate is at stake and the owners have no personal knowledge of the record of the several estimators, they have a right to some idea of the manner of doing the work.

The fundamental principles of estimating are very simple and consist in ascertaining the number of trees, their dimensions and the percentage of merchantable timber in them. The measurement of a tree is very simple and of little importance.

The principal difficulties of estimating are : 1. Locating the land to be estimated. 2. Determining the number of trees. 3. Determining the average size of the trees. 4. Determining the percentage of defects. 5. Determining the proportions of the several grades of lumber.

In locating land the most intricate problem of land surveying may arise even where the land has been subdivided into sections or when subdivided into so-called forty-acre tracts. In such cases the adjustment of errors and the re-establishment of lost and obliterated corners require a high degree of technical skill.

In practice, lines are run and location is kept by compass and pacing or by transit and chain, according to the accuracy desired and the difficulties of the ground.

The counting of trees may seem a simple matter and under some circumstances it is. When all of a small group of trees are in view from one point it is easy to count them, but a large tract of dense timber or a few timber trees among dense saplings are different problems.

The defects of timber, whether from rot, crooks or worm holes, are matters of close study. They are to be familiarized (though never mastered) only by long study, not only in standing timber, but also in seeing defective logs put through the mill.

In estimating grades of lumber that may be manufactured from the timber in question, the highest skill is necessary. In considering methods of estimating, the differences of general forest conditions are also to be borne in mind ; that is, whether the forest is broken by openings, such as lakes, swamps, meadows, brush land or burns, or whether it is young and thrifty or old and defective. In the application of European methods used in estimating cultivated uniform forests there to primeval or natural or irregular forests here, there should be great caution, for uncultivated forests rarely have such a uniform stand. That one acre may represent a forty-acre tract or that any portion of a large forest can be chosen to represent the whole is a very serious qnestion. In this fact lies a difficulty inexperienced men are apt to stumble over. The selection of representative tracts to be measured or closely estimated to serve as a factor for the whole tract is a problem the most skilled estimators are reluctant to undertake.—Pacific Coast Wood and Iron.

A FEW COMMON BOILER TROUBLES.

BLISTERS—Blisters often appear on the plates of a boiler after the boiler has been in service a short time. Formerly, when iron plate was used in boiler construction, it might be said to be exceptional to find a boiler that had been in use for some time without showing, somewhere, evidences of a blister. This was because the mode of manufacture of the iron tended to produce a laminated product of such a character that a part of the plate could easily seperate from the rest of it. If at some point the various layers of plate were not firmly united to one another, the heat conducting power of the plate would be materially lessened where the layers were not firmly united, and the result would be that outer layers could become so much overheated as to soften and bulge outward. Now that steel is used so commonly in the manufacture of boilers, it is rare to find a blistered or laminated plate, although occasionally they do occur. Blisters, in most cases, are harmless, as they cover only a small area. A blister on the heating surface can be best treated by chipping off the projecting part so as to leave a clean surface of the sound plate exposed to the fire. Unless the blister is very large in extent, it is not wise to cut out the part of the plate in which it occurs. Many a boiler has had its strength materially reduced by having part of the plate cut out in this way and replaced by a single riveted patch, when the other seams of the boiler were double riveted.

FIRE CRACKS—There are cracks extending from the edge of the plate to the rivet holes. On the horizontal tubular type of boiler they are found chiefly on the girth seams over the furnace, and in internally-fired boilers any of the joints in the firebox may show them. (The inner side of the door is liable to be attacked also.) In most cases fire cracks do not leak unless they extend past the rivet hole. In this case a ½-inch hole should be drilled at the end of the cracks, and a stud-bolt screwed into it. This will stop the leakage and prevent a further extension of the crack. Firecracks are due to several causes. Thus they are especially likely to appear when the material composing the plate is hard, and does not possess a proper degree of ductility. Again the plate may have been injured in the construction of the boiler by the careless use of the drift pin. Poor management of the firedoors is also responsible to a considerable extent ; for when the firedoors are thrown open while a hot fire is burning, so as to allow the cold air from the outside to strike directly against the heated plates, a sudden contraction of the material results, and this is likely to be followed not only by fire cracks, but also by leakages at the seams in general, or at the tube ends at the rear head. Care should always be taken to avoid all unnecessary admission of cold air against the plates when the boiler is under steam.

OIL—When heavy lubricating oils, or oils of any sort that leave a considerable residue upon evaporation, find admission to a boiler, it is almost certain that defects will sooner or later make their appearance, and will be followed by an expensive bill for repairs. The commonest way for oil to get into a boiler is by being pumped into it together with the drips from a system where exhaust steam is used for heating, and the water of condensation is returned to a receiver. In all systems of this kind an oil separator should be used, and the drip from this should be carried to a sewer. (The writer remembers a case in which the drip from sewer, ss that the oil passed into the receiver even more the separator was led into the receiver instead of the directly than it would have done had there been no seperator present. The boilers at this point were nearly ruined in a very short time). In some cases the exhaust pipe from the engine may be provided with a separator, and yet the receiver may receive the returns from one or more pumps, each of which contributes a certain amount of oil. Oil also gets into the feed water in connection with condensing engines, when the condenser water taken from the hot well is used as part of the feed. It is impossible to prevent oil getting into the boiler when feed water is taken from this source. The importance of excluding oil absolutely from boilers can hardly be understood by those who have not seen the damaging effects that may result from the admission of even a small quantity of it.

PITTING—Pitting in boilers or piping is usually observed where the water is kept for a considerable time at a temperature somewhat below 212 degrees. The boilers mostly affected by this sort of trouble are those used for heating ; and in these it is observed chiefly in the autumn and spring, when the boilers are used only part of the time. At such times pitting is likely to be very marked, and it is nothing unusual to see a set of tubes used up in two or three years. In an instance that came under my observation, a new boiler was put into service for power in the month of December, being used in connection with five others. Business becoming slack at this factory, about the time the new boiler was installed, only three of the available six boilers were needed at any one time. The practice was to use three of the boilers for two weeks, and then to allow these three to stand idle for two weeks, without emptying them. In the following August three of the tubes in the new boiler gave out. Upon investigation it was found that the tubes in this boiler were all badly pitted. The three that had given out were replaced with new tubes, and the boiler was thoroughly boiled with soda ash. Two more tubes gave way during this process, and were replaced.

The battery was then put in use again under the same conditions as before, except that every boiler was now emptied when not in service. This occurred eight years ago, and the tubes are still in good condition. The tubes in the older boilers were not affected, as they were covered with a film of scale which protected them. To protect boilers in which pitting takes place, the writer would advise that about 10 pounds of lime be slacked and put in each boiler. This will cause the formation of a thin scale which will prevent pitting for a time. When this protective coating is dissolved away, the operation should be repeated. Of course this treatment is not recommended for a boiler in which there is already a plentiful supply of scale. This should naturally be understood, because it is not in these boilers that pitting occurs. Still, it may be as well to speak of this point explicitly in order to avoid misunderstanding.—R. A. Douglas, in American Electrician.

THE NEWS

George A. Huff is building a saw mill at Alberni, B.C.

Charles Warwick, of Shedden, Ont., has sold his saw mill.

George Dutch, who operated a saw mill at Seaside, N.B., died last month.

Morrison & McCammon have established a lumber yard at Grand Forks, B.C.

G. H. Bawtinheimer & Sons will open up a lumber yard at Red Deer, N.W.T.

J. H. Bolton has purchased the lumber business of Turnbull & Davidson, at Darlingford, Man.

R. N. LeBlanc, of Bonaventure, Que., has lately added new machinery to his saw mill equipment.

John E. Moore, of St. John, N.B., has purchased the mill property at Pleasant Point from C. E. Barnhill.

Vigars & Company, of Port Arthur, Ont., have closed down their saw mill for the season, after making a large cut.

The Columbia Saw Mill Company, of Hazlemere, B. C., has been dissolved, J. B. Kinney continuing the business.

S. R. Poulin, planning mill owner, Ottawa, has admitted a partner and changed the name to S. R. Poulin & Company.

The Cleveland & Sarnia Saw Mills Company, of Sarnia, Ont., have obtained an Ontario charter of incorporation.

Forest fires were reported to be raging in some parts of New Brunswick and Nova Scotia during the last week of August.

The Pigeon River Lumber Company have commenced work on the building of a new saw mill and offices at Port Arthur, Ont.

It is reported that William A. McPherson is negotiating for the purchase of the saw mill at Port Daniel, Que., owned by Moreault & Bodard.

J. C. Risten & Company, Limited, wood-workers, and H. Chagnon & Company, sash and door manufacturers, Montreal, have registered partnership.

The Revelstoke Lumber Company, of Revelstoke, B.C., has elected James McMahon president, R. Houston secretary, and D. Robinson manager.

A cornmeal mill will be built at Owen Sound, Ont., by Chandler & Company, of Richford, Vt. A large copper shop will be erected to supply barrels.

The Rat Portage Lumber Company are putting in a large band mill and other new machinery in their mill at Beaver Mills, Ont., recently purchased from Hughes & Long.

W. R. Way, of Beaverton, Ont., has built a shingle and tie mill at Wilberforce, and has secured a large contract for sawing from McCormick & McLeod, of Bracebride.

David Gage, of Lindsay, Ont., has recently built a saw mill at Goulais Station for the Clergue Syndicate, of Sault Ste. Marie. It is said that the mill will have a capacity of 60,000 feet per day.

A. Tait, lumberman, of Orillia, Ont., has entered suit against ex-Mayor Sanderson for unstated damages for alleged libel and slander growing out of statements made a recent meeting of the Orillia town council.

The new wood-working factory of James Leigh & Sons at Victoria, B.C,, is under construction. Machinery is being installed for the manufacture of office supplies and furnishings, boxes and sash and door work.

Charles Woodruff, of Toronto, has gone to Woodruff's Bay, Lake Joseph, to operate a saw mill, the machinery for which was purchased in Toronto last month. The mill will be a circular and will cut hardwoods and hemlock.

The Saginaw Lumber & Salt Company are about to commence the removal of their saw mill from Saginaw, Mich., to Sandwich, Ont. The company has purchased twenty-eight acres of land on the river front below Sandwich, which is regarded as a very desirable location by reason of its contiguity to Detroit.

J. & T. Charlton, of Collingwood, Ont., are extending their lumber yards and putting down new switches.

Several Michigan operators will probably close down their mills in Michigan when the present season is over. The mill of C. K. Eddy & Sons is now idle and may not go into commission again on the Saginaw river. The mill of Pitts & Company is in the same position. It is probable that some of these firms at least will transfer their operations to Ontario.

The Cushing saw mill at St. John, N.B., is now being operated to its fullest capacity, the weekly cut being one and a half million feet. In about two weeks the Miller & Woodman mill recently acquired by the Cushings will be ready for operation. Eight shingle machines and one gang saw will be put in operation.

An important lumber deal was concluded last month, by which W. R. Williams, Henry Patton and F. G. Smith, of New York, secured control of the timber lands on the St. Mary's River, Cuysboro county, owned by the Nova Scotia Lumber Company. The property comprises about 75 acres, and is thickly wooded with spruce and birch. The company contemplate carrying on operations on an extensive scale.

The Van Buren Lumber Company has recently been organized at Bangor, Maine. The company will have a capital of $500,000 and consists of Thomas Cochran, of Edmunston, N.B., John N. Stevens, of same place, and Allan E. Hammond, of Van Buren. The company will operate two saw mills at Van Buren, one at Edmusston and one at St. Anne, N.B. It is also proposed to build a mill at Frenchville, N.B., with a yearly capacity of 25,000,000 feet.

A dispatch from Sarnia, Ont., dated August 8th, says: For twenty years past the price paid for unloading lumber from vessels has been fifteen cents a thousand feet, with very little variation. A few days ago the newly-formed Longshoremen's Union put on a new scale making twenty cents the minimum, with additional charges for certain kinds of lumber, and a rate per hour of thirty to thirty-five cents. The present rate per thousand for bringing lumber from Georgian Bay to Sarnia is $1. The extra wage means five to ten per cent. extra at each end, and there is little left out of the dollar when the cargo is finally landed.

READING CAMPS.

Mr. A. Fitzpatrick, of Nairn Centre, Ont., the originator of the movement to establish in isolated districts free reading camps for the benefit of those engaged in lumbering and mining operations, states that satisfactory progress is being made, and that fully 35 reading camps will be in operation this fall, principally in the districts of Algoma, Parry Sound and Nipissing. Speaking of the movement he says:

"This year I am not building any camps at my own expense. The lumbermen are offering to erect the buildings. Including employers at pulpwood operations, the lumbermen have volunteered to erect thirty-five separate shanties at their respective camps, half of them to be furnished at their own expense. That means that the lumbermen of this Province will invest about five thousand dollars in reading camps. To supply daily and weekly newspapers in French and English, and magazines to these 35 reading rooms, and to supply about 25 other camps that have no special buildings for the purpose, will require $1,200 or more. I also wish to furnish these with paper files and innocent games, and about half of them with stoves, lamps and a few chairs. This will require at least $800 more. To say nothing of my personal expenses, including postage, which must be met in some way, we shall require at least $2,000 to carry on this winter's work successfully. I do not hesitate for a moment to ask the public for this amount, and have not the slightest doubt but that we shall get it. The action of the employers in mines, pulp-wood and other lumbering operations in themselves taking the initiative in this work is almost without precedent, and should be encouraged by the heartiest co-operation on the part of the Provincial Governments and the public generally. We do not ask other manufacturers at their own expense to provide reading, church and school accommodation for their men. We pay our taxes and assist them to do this. To fail to co-operate with the employers of labor in isolated localities in a matter of such vital importance to the whole community would be, to say the least, criminal. Their effort to elevate these men and counteract the dull and deadening influences of their life is most commendable, and should be seconded by every lover of his country and by every member of all Provincial governments."

COMMERCIAL USES OF SAWDUST.

Some twenty establishments in Europe make oxalic acid out of sawdust. There are six in Germany, twelve in England, one in France, and one in Belgium. The sawdust of some wood is better than others for this purpose. Yellow and white pine, dried, contain 94 per cent. of oxalic acid; oak, 83 per cent.

Sawdust is used in Scotland to some extent in making floor cloth and linoleum, certain kinds of heavy stamped or embossod material to be used instead of wall paper, coarse wrapping paper and millboard, and certain coal substitutes for domestic use. It is also employed (mixed with melted rosin and pressed into squares) in making fire-lighters. Sawdust is not employed in any chemical manufacture in Edinburgh, except to a very slight extent in the manufacture of gunpowder and other kinds of explosives.

The average current price of dry white sawdust, according to "Trade and Industry," Manchester, England, is 10s. 6d. per 2,240 lbs., although as high as 18s. has been offered. The price was formerly about 8s., the advance being largely due to the high price of coal, which has caused the mills to use their sawdust as fuel; also to the fact that the value of sawdust as a material of manufacture is beginning to be recognized.

THE LATE MR. NELSON GRAY.

By the death of the late Mr. Nelson Gray, which took place in Montreal, on August 15th, the lumber trade of Canada loses one of its oldest and sturdiest pioneers. Sixty years ago Mr. Gray first took down his rafts of lumber to Montreal and Quebec, and from that day to this his name has stood for sterling enterprise, honesty and worth.

It is seldom that the life of a nation is so identified with that of any man as in the case of the late Mr. Gray. Long before the whistle of a steamboat was heard on our rivers, or the trail of the railway was seen in our fields, he was getting out his logs, bartering his merchandise, opening up the country and clearing the rocky road of Canada's advance to nationhood.

Born in Williamsburg, Ont., on Nov. 7, 1822, he entered the lumber business while yet a mere lad. In 1842 he married Marjory, eldest daughter of Adam Cockburn, the founder of the village of Berwick, Ont., and shortly after moved to the county of Stormont, where he founded the village of "Gray's Corners," now the large and thriving town of Finch. Here he established a general merchandise, lumber and pearl-ash business, building up quite a competence while yet a young man. But on one winter mid-night a fire starting from some unknown cause spread from building to building, and before anything could be done beyond saving the inmates, the work of years was utterly destroyed. It is related of Mr. Gray in this connection that when a party of friends called to condole with him on the morning after the fire, they learned that though now practically penniless he had got together a gang of men and was even then back in his limits getting out timber. Another story related of him tells of an accident in mid-stream, a broken crib and a decent of the Lachine Rapids on three sticks of timber.

In 1865 Mr. Gray removed to Acton Vale, Que., where he developed an extensive lumber trade with the States supplying large quantities of shipping timber for the United States Navy during the Civil War.

Although doing business in Montreal on and off for many years, it was not until about twenty years ago that he made his headquarters in Montreal, where he had remained and transacted business until the date of his death. Though meeting with heavy losses he never failed to recover that position of honorable independence which his ability invariably commanded.

Up to the time of his death, at the ripe age of 7[illegible] years, it might be truthfully said that he was a man without an enemy, a Canadian merchant of the old school, one of the fathers of the lumber trade, and a landmark for two generations now unhappily removed.

Mr. Gray leaves a widow and seven children to mourn their loss—four daughters and three sons.

MISCUT LUMBER.

D. H. BLOOMER, in St. Louis Lumberman.

THERE is an irresistible temptation latent in the breast of every sawyer to make a "big day's cut," and to a certain extent the mill owner shares in this weakness of the sawyer, and in many instances he is the prime factor and moving spirit in urging the tendency to a degree of serious damage to his own interest.

The first and most important duty of the mill superintendent is to determine the exact capacity of his mill, and by this I do not mean how many logs the mill can be made to cut in a given time or how many thousand feet of logs can be run through it in ten or eleven hours, but how many feet of lumber can be properly manufactured in a given time with reasonable activity under ordinary conditions.

I have applied every form of mathematical calculation known to economic principles, in the manufacture of lumber, to find some tenable excuse for miscut lumber, up to date I am "still behind the lighthouse." Just as soon as you discover that your mill is turning out miscut stock you have also learned that there is something wrong somewhere; it may be with the filer or the sawyer; may be with the carriage or carriage track, or somewhere in your equipment; but one thing is certain, the time for investigation is at hand and if you fail to investigate and rectify the evil, you are in the wrong position, and my advice is that you engage in pearl fishing or "possum huntin'." So that you will fully sense the evils of neglect in this important matter, I will do a little illustrating and ask you a few questions that have presented themselves to me for solution at various times in the past. When you are shipping two-inch lumber in the rough and you find a plank twenty to thirty inches wide perfectly clear throughout, three inches thick at one end and an inch and a quarter at the other end. What do you do with it? Oh! you lay it out and ship it for 1¼. Do you? Well, I have drummed all the domestic markets over pretty thoroughly in the past and I do not know of any one who will take the board for anything better than cull and this means a decrease of four-fifths in the value of your lumber (when the stock would be 1st and 2nd clear if well manufactured), and taking the average Southern product as a basis of calculation, the loss means about twenty to twenty-four dollars per thousand figuring the decrease in value alone. But not about the loss in material and freight in case there is no way at hand to dress it down to a uniform 1¼ before shipment? and if there is how much the cost of dressing down?

There are so many different kinds of miscut lumber and so many different features of loss on account of trade and distinct material that it would be an expensive task to even begin to mention them all, but from the one I have given, you can easily trace a thousand others in case you know anything much about lumber.

Nearly everyone whose methods of manufacture result in poorly manufactured lumber has some way of excusing the defect, and I know of several who justify it or at least who think that they justify it and let me tell you how they do it.

They figure the cost of production at $6 per M; this includes timber cutting, log handling, delivery of lumber from the saw mill to the piling yard, also the cost of piling and loading on cars, then they calculate that they can saw 20,000 ft. of well manufactured lumber per day, or by crowding everything to the utmost, 30,000 feet, in which there will be about 5000 feet of miscuts; then the operation proceeds to embrace "six times ten is sixty" (or the full cost of production of the amount of lumber cut in excess of the mill's capacity) to take care of the damage entailed by the rush movement.

Granting this system of computation to be correct in every detail, the management would be radically wrong, but it is not correct because the actual cost of sawing the logs under the mill roof is the only item that can be figured against the destruction of material and let us see how much this really is. I am going to use the prices that have come under my observation at the mills during the past three weeks; in my calculation log cutting per thousand 50c.; hauling to mill, $2.50; conveying lumber from mill to yard, 30c.; piling, 40c.; loading on cars rough mill run, 60c.; this figures up $4.30 for the work outside of the sawing and $4.30 deducted from $6.00 leaves $1.70 for you to figure against your loss on miscuts. Look into this matter, "Mr. Rush," and tell me if you find anything wrong with this calculation.

I mentioned that sometimes the filer was to blame for miscut lumber, and sometimes the sawyer, etc., but I have made up my mind that by far the greater amount of mischief lies in crowding your mill above its capacity. You can't cut 100,000 feet of lumber per day with an 80,000 mill; you can't cut 30,000 feet a day with a 20,000, andmake merchantable lumber, and it is not good management to do so.

When you take a log that is worth $10 at one end of your mill and send $5 worth of lumber made from this same log out at the other end you are on the wrong tack.

I am just a little sorry that I haven't more time to devote to this subject, as it is by all means the most important subject for consideration by the small mill operator in the whole process of production and is being too much neglected by this class everywhere. It should be considered by every mill operator that logs have an intrinsic value that should be enhanced and increased through the medium of labor instead of being decreased and destroyed. I will touch this matter again some future time.

PERSONAL.

It is rumored that the honor of knighthood is to be bestowed upon Mr. J. R. Booth, the enterprising lumberman and railway king of Ottawa. It is universally acknowledged that such an honor is well deserved.

CASUALTIES.

Alex. Miller, working in a sawmill at Ragged Chute, near Shawville, Que., met with an accident by which he lost three fingers.

James Lindsay, millwright in Robert Watt's sawmill at Wiarton, Ont., was seriously injured by a splinter of wood from the lath machine, the sliver entering deeply into his head through the eye, producing concussion of the brain.

BURNING GREEN SAWDUST.

The chief engineer at the Midway Saw Mill, Midway, B. C., writes to the CANADA LUMBERMAN as follows:

"In the August number you have an article on burning green sawdust. I think the party who is having trouble has not got furnace room enough. We had similar trouble. Green sawdust takes large furnace room and combustion chambers, which can only be got by using a Dutch oven or extension furnace. It can be made of a size to burn green sawdust and almost anything else, for elm or similar sawdust. The grate surface should be twice as large as for wood or pine sawdust. I think I saw one of these furnaces illustrated in THE LUMBERMAN last winter."

WOOD PULP DEPARTMENT

NORWEGIAN WOOD PULP.

Reporting upon the trade and commerce of Norway, Consul-General Dundas states that the production of pulp, especially mechanical pulp, was not appreciably larger in 1900 than in the preceding year, owing to the scarcity of water, but prices were very high—on the average about 55s. per ton, compared with 28s. to 29s. in the summer of 1899, when as much as 65s. was paid for prompt delivery—and as the demand was very great, munufacturers were masters of the situation. But only about half of the production profited by the rise in prices, the rest having been sold in advance. As formerly, the United Kingdom was the largest customer, with Germany, France, Belgium, Spain and others in order of precedence.

The quantity exported was :

	1899.	1900.
Dry	19,768 tons.	21,546 tons.
Wet	284,023 "	301,545 "

Of which Christiania supplied :

	1899.	1900.
Dry	8,741 tons.	6,670 tons.
Wet	34,265 "	38,052 "

The same conditions applied to cellulose, or chemical pulp, added to which the high price of coal is said to have been felt in no small degree by those works dependent on its use, so that on the whole 1900 is characterized as only a fairly good year, some factories doing well, but others the reverse. The total export was 94,885 tons dry and 10,288 tons wet (of which 68,525 tons went to the United Kingdom), compared with 75,731 tons dry and 7,490 tons wet in 1899. The quantity exported through the port of Christiania was 31,403 tons dry and 4,020 tons wet, compared with 17,814 tons dry and 3,948 tons wet in 1899. The foregoing figures include a little re-exported Swedish cellulose.

THE PULP MARKET.

For some time past there has been pronounced weakness in the wood pulp market. In Great Britain, it is said, there are large stocks of mechanical wood pulp, with very little demand, and offers have been made at 37s. 6d. per ton c.i.f. Manchester. Paper-makers are making requests to defer deliveries. On the other hand considerable purchases have been made for next year, so that it would seem that paper-makers have faith in brighter times ahead, and believe that prices have reached rock-bottom. Reports from Scandinavia state that prices are now showing a tendency to harden.

In Great Britain dry mechanical pulp is quoted at £5 to £5 3s. c.i.f. London and Manchester; and 50 per cent. moist at £1 17s. 6d. to £2 7s. 6d. The price of chemical pulp delivered at same ports ranges as follows : Sulphite, bleached, £12; unbleached, £9 5s. to £9 10s.

In the United States prices are correspondingly weak, ground wood pulp being quoted at $13 to $14 per ton at the mill. Most of the mills have been enabled to keep in operation all summer, not having been shut down for any length of time on account of inadequate water ; consequently, the stock of pulp is rather heavy. Some of the Canadian mills are also carrying more than the usual supply of mechanical pulp.

COMBINE OF PULP MANUFACTURERS.

A meeting of the American Sulphite Manufacturers' Association was held at Niagara Falls, N.Y., on August 19th. The following Canadian companies were represented : Laurentide Pulp Company, Grand Mere, Que.; Riordan Paper Mills Company, Merritton, Ont., St. John Sulphite Fibre Company, St. John, N.B. A proposition was submitted to the meeting to establish a company to act as a central selling agency, the object being to regulate the price of pulp and to make the produce more uniform and of recognized grades. Each company to hold stock in proportion to the tonnage of pulp produced. The agency would be governed by a board of directors, each mill being entitled to a representative on the board. The product of the mills would be marketed by the company, receiving for its compensation two per cent.

The plan was fully discussed and was placed in the hands of a standing committee to consider and report at a meeting to be held in New York on September 18th. It is realized that it would be necessary to secure the co-operation of all pulp manufacturing companies in order to make the scheme the success it is intended to be.

PULP NOTES.

The statement of the Maritime Sulphite Fibre Company, of Chatham, N.B., values the mill property and equipment at $1,204,572.70.

Wood pulp was imported into Great Britain during July last to the extent of 46,942 tons, an increase of 65 tons compared with July, 1900.

Mr. Menier is said to be negotiating to build a mill on the island of Anticosti for the manufacture of wood pulp, chiefly for export to France.

It is reported that a Canadian syndicate has been looking over a water power at Holeb Falls, Maine, with a view to the erection of a large pulp and paper mill.

A representative of an English syndicate last month visited the provinces of Quebec and New Brunswick looking into the possibilities for establishing a large paper manufacturing plant. It is desired to establish a paper mill with a capacity of 200 tons of paper per day. The water falls at Grand Falls, N.B., was, it is said, considered very favorably.

It is stated that J. W. Munro, M.P.P., of Pembroke, has sub-let to a United States firm his contract for the construction of pulp mills at Webbwood, Ont., for the Spanish River Pulp & Paper Company.

Pulp for paper was imported at Barcelona last year to the extent of 2,784 tons, of the value of £22,372, a drop in quantity but an increase in value compared with the previous year, when 3,158 tons were received, of the value of £21,520.

The W. & A. McArthur Company, of Cheboygan, Mich., who operate a saw mill at Little Current, Ont., are said to be figuring on the erection of mills at Cheboygan for the manufacture of pulp and paper, in order to utilize their water privileges.

Honorable W. C. Wells, Commissioner of Crown Lands for British Columbia, has entered into agreements with the Pacific Coast Power Company, of Victoria, and the Industrial Power Company, of Nelson, by which these companies acquire extensive timber limits on the British Columbia coast for the purpose of engaging in the manufacture of pulp and paper.

Application has been made for the incorporation of the Franco-Canadian Steam Navigation Company, of Canada, Limited, with headquarters at Montreal and capital of $1,000,000. The Clergues, of Sault Ste. Marie, Ont., are interested. It is proposed to establish a direct service with France, which service it is expected will greatly facilitate the shipment of Canadian pulp to that country.

Tenders were invited a fortnight ago for the necessary power development and construction of pulp mill at Brompton Falls, Que., for the Brompton Pulp & Paper Company. The buildings for which tenders were invited include a pulp mill 142 x 84 feet, two storeys high, and a wood-preparing building 67 x 65 feet, two storeys, both of brick and steel construction with gravel roofs. The president of the company is George E. Bearce, of Lewiston, Maine. E. W. Tobin, M.P., of Brompton Falls, Que., is a director.

A petition was filed at Osgoode Hall, Toonto, on August 25th, on behalf of Charles Reimsborrow, of Chatham, N.B., for investigation into the affairs of the Maritime Sulphite Fibre Company. It is alleged in the petition that the company, without consent of its creditors or without satisfying their claims, conveyed to the Royal Trust Company, of Montreal, and Hugh Robinson, Montreal, certain real and personal property, representing the whole or main part of their assets in trust for the benefit of bondholders, said fund amounting to $500,000.

A pulp maker, who is well posted on the wood question, made the following statement while in attendance at the recent meeting of Sulphite Pulp Manufacturers : "American pulp makers need not expect to get any wood from Ontario. The two years' limit in which wood from there could be exported is now up, and exports must cease so far as timber from the Crown lands are concerned. For instance,

there are 6,000 cords of wood from Sturgeon Falls lands that has been offered in the market at $7.50 a cord, peeled and sawed in 2 feet lengths. There was at first a prohibition against its being sold at all, but finally the authorities allowed it on condition that it be manufactured in Canada. They absolutely prohibited its exportation under any conditions. Ten, again, Quebec has reduced her stumpage fees from $1.90 a cord, with a $1.50 rebate, to 5 cents a cord, with 25 cents rebate. She, however, was careful at the same time to reduce her legal cord for wood cut on Crown lands from 1,000 feet to 600 feet, which it is now. No, sir; if Americans want our wood they must build their paper and pulp mills in Canada."

It is announced that the Edward Lloyd, Limited, of England, have contracted to handle the entire output of the mills of the Laurentide Pulp Company at Grand Mere, Que. Mr. S. C. Phillips, who is closely associated with the Lloyds, made this statement when in Montreal recently: "Three or four years ago there was little or no interest felt in Great Britain in Canada's pulp wood supply, yet the change has been so rapid since then that they are now receiving from Canada one-sixth of the total quantity consumed in the Old Country, and Canadian competition with Norway and Sweden has been most successful in the English market. For years, he said, the trade in Great Britian was at the mercy of the Scandinavian exporters, but the latter have been placed on the defensive by the excellent quality of the Canadian product. Formerly the excessive freight rates worked to the disadvantage of Canada, but the figure is now comparatively low, and Mr. Phillips does not hesitate to say that in two or three years the Canadian product imported into Great Britain will reach one-half of the total quantity used in the three kingdoms, and as the total value is about $15,000,000 yearly, half of this will fall into Canadian hands. The Scandinavian forests are somewhat depleted, although still large, but if they last twenty-five years the Canadian supply is good for 200 years at least.

The Garfield Oil Company, of Cleveland, have an extensive and attractive exhibit of lubricating oils in the main building of the Toronto Exhibition. Owing to the increasing demands of their Canadian trade, this company are opening a branch in Toronto. Mr. R. S. Flint is their Canadian representative.

AUSTRALIAN TIMBER AND TIMBER GETTING.

In a report by the Queensland Inspector of Forests, descriptive of a visit to New South Wales, that official gives some interesting particulars regarding operations in the gum forests. The system of working is that any person desirous of cutting gum must apply to the State Head Forester for a permit, for which he pays 10s per month, and may employ as many men as he may desire, giving to each a certificate that he is so employed. The State Head Forester allots a certain portion of the reserve on which the permit may be used, and as the timber is cut it is branded by the Crown at the stump, both log and stump being branded with white lead, each with a running number as well as with its length and circumference, a sub-forester entering every such number in his book for the State Head Forester's Information. The timber is then removed to the river depot, and if left in the depot three months, royalty must then be paid thereon. For instance, timber removed to the depot in January would require to be paid for at the end of April, and if not removed after the royalty is paid the owners must still hold a permit costing 10s per month. No red gum is allowed to be cut under a circumference of 7ft. 6in. at 5ft. from the ground, but small timber for piles, girders, &c., can be obtained at 15s up to a length of 30ft., but above such length 6d per running foot is charged.

For the purpose of assisting in the production of this timber a system of thinning-out and cleaning-up of the reserves is adopted, and about 25,000 acres have been dealt with, on the following lines :—Gangs of men, about 12 in each gang, are employed under an overseer at a wage of 7s per diem to the men, and 8s to the overseer, to ringbark any large and useless trees, and to thin out waste or crooked saplings, the latter being rooted out; and as this is done all fallen timber is gathered in heaps and burned, thus cleaning-up the reserve. This work costs from 6s to 10s per acre. The outlay may appear heavy, but it is most valuable for the following reasons :—

1. It prevents the destruction of numberless plants, saplings, and trees by fire, through the fallen timber making a far larger volume of fire than the grass alone would make.

2. The destruction by ringbarking of useless timber and the cleaning by fire is found to produce numberless young gum plants, and to greatly increase their growth.

3. As each tree or sapling fit for cutting as a pile is worth at least 15s, the cost of the work is not to be compared with the future benefit to the state therefrom.

4. The cleaning-up of the reserves, which are in many parts let at a rental of 3d per acre for grazing, tends towards obtaining a higher rental by the increase in production of grass for pastoral purposes.

5. The dead trees and logs being cleared enables the timber-getters to get more timber.

6. From examinations of portions of the reserves before and after thinning out and cleaning up, and from the healthier appearance of the young trees on the cleaned areas, in comparison with those uncleaned, and which it is considered is due to the trees obtaining a larger proportion of air, light, moisture, and growing space, it appears that the work will be reproductive and greatly assist to maintain an ample and permanent supply of matured timber.

NORWAY'S FOREST WEALTH.

The forest wealth of Norway is being rapidly diminished. An expert commission appointed by the Government made an alarming report showing that three trees were cut down annually for every one that grew, and in that climate it takes a hundred years for a pine tree to grow big enough to furnish a log twenty-five feet long and ten inches in diameter, which is the minimum available for the saw mills.

It was shown by the last census that the standing timber of the kingdom has been reduced to 68,179 square miles, or 21 per cent. of the entire area, whereas 1855 55 per cent. of the country was covered with forests.

It is estimated that within the next half century the timber resources of Noaway will be practically exhausted at the present rate of destruction.

THE LEFFEL AND VULCAN TURBINES

POSSESS DISTINCTIVE MERITS, which should have the attention of water power owners 1st—They are strongly and carefully built. 2nd—They are economical in their use of water. 3rd—They develop more power in proportion to the water used than any other Turbine built. Mr. J. D. Flavelle, of the Flavelle Milling Co., of Lindsay, writes us under date of March 7th as follows:

"Referring to the two 74" water wheels (Leffels) purchased from you during the past year. As far as we have had an opportunity of testing, they have done their work excellently, in fact are doing more than you guaranteed them for. We took a test of the power they were developing with a head of water of 3 ft. 10 in., and they developed very close to 100 h. p. We are thoroughly satisfied with same."

This letter is but one of many such.

This Saw Stands Without a Rival

AND IS THE

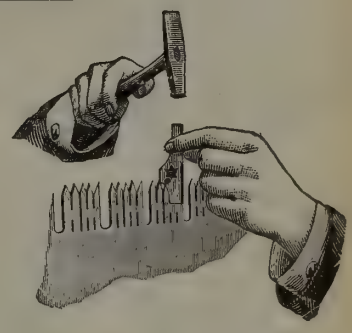
FASTEST CUTTING SAW IN THE WORLD!

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

Maple Leaf Saw Set

MANUFACTURED BY

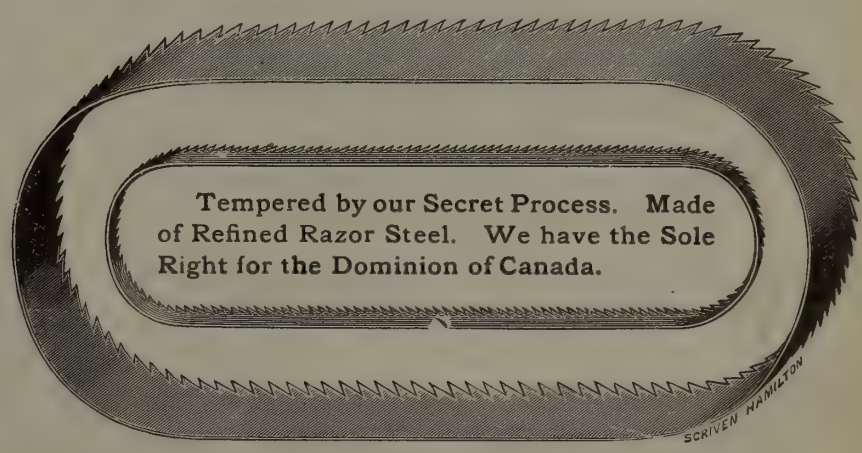
SHURLY & DIETRICH, Galt, Ont.



Directions.—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake Be sure and not strike too hard a blow, and it will set the hardest saw. **On receipt of 40 cents we will send one by mail.**

We are the only manufacturers in the world who export Saws in large quantities to the United States.



Tempered by our Secret Process. Made of Refined Razor Steel. We have the Sole Right for the Dominion of Canada.
SCRIVEN HAMILTON

We Manufacture

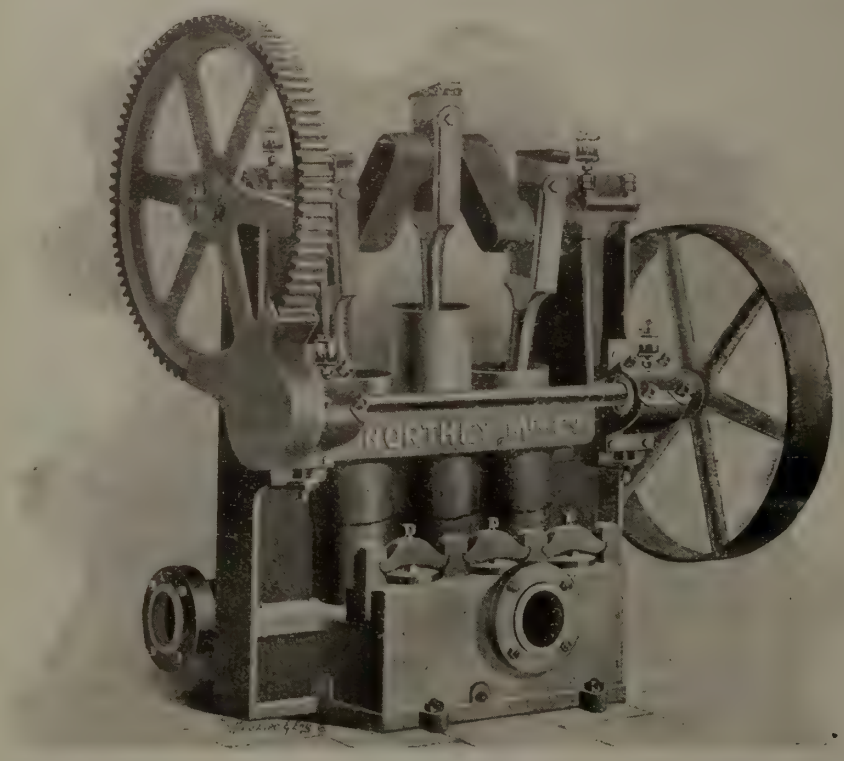
HIGH GRADE BAND SAWS

of All Widths and Lengths.

These Saws are made of Refined Swedish Steel imported direct, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

Northey Vertical Triplex Stuff Pump

For handling Stuff in Pulp Mills



We illustrate here a high grade stuff pump embracing the most advanced ideas and improvements in the manufacture of this class of pump. The three cranks are placed 120 degrees apart, giving a practically constant unvarying flow. Can be conveniently operated by electricity, water power or by belt from engine. Different styles and sizes to suit various duties.

We manufacture every style and type of steam and power pump for stationary, marine and mine duties. Our products are standard in Canada. Catalogues and specifications sent on request.

We also make the Northey Gas and Gasoline Engine, the handiest, quickest-applied power in the market. Any boy can manage it. Built in all sizes.

LUMBERMEN'S RECEPTION TO ROYALTY

The Hewers of the Forest Give a Practical Demonstration of Lumbering—The Most Unique Event of the Royal Trip—Expressions of Appreciation by the Duke.

In the reception and entertainment tendered their Royal Highnesses, the Duke and Duchess of Cornwall, and suite, in Ottawa, the lumber kings of Ottawa Valley took an important and interesting part. For weeks previous to the visit of Royalty, the lumbermen had been preparing an entertainment. This was to provide an interesting and profitable series of object lessons in Canadian lumbering. That the committee was eminently successful, was proven by the heir apparent's words of approval and appreciation.

On the occasion of King Edward's visit to the young capital forty-one years ago, the lumbermen received him as their guest and entertained him in a manner that still brings a look of pride and word of praise from the older residents. The heir apparent, then Prince of Wales, was met on the river below Rockliffe by a flotilla of canoes bearing five hundred jauntily attired rivermen, raftsmen and Indians. The Royal steamer was escorted to the landing. Afterwards the above mentioned advance guard acted as his escort through the city. The Prince was also given a thrilling trip on a raft of square timber through the slides at the Chaudiere. Mention is made of this fact to establish a precedent for the latter day doings.

On September 23rd another heir apparent, accompanied by His Gracious Consort, was the guest of the open-hearted lumber kings of the city and valley. The first feature of the entertainment was the running of the slides. Rafts, strongly built and comfortably fitted, were provided. They were manned by tried and trusted rivermen. The trip from Government House to the riverside above the slides, four miles distant, was made over the Ottawa Electric Railway in a magnificent car, newly built and specially fitted up. Their Royal Highnesses and party were received at the foot of Oregon street by Sir Wilfrid Laurier, Messrs. J. R. Booth, Alex. Barnet, C. Jackson Booth and George H. Perley. The Duchess of York was escorted down the landing by Mr. Perley, followed by the Duke and Countess of Minto. Lord Minto and Sir Wilfrid Laurier followed with the rest of the party, which included Prince Alexander of Teck, Lady Mary Lygon, the Duke of Roxburghe, Viscount Crichton, Hon. Mrs. Derek-Keppel, Sir Arthur Bigge, Commander Winsloe, Commander Godfrey Faussett, Major Bor, Lord Wenlock, Capt. Graham, Capt. Bell, A.D.C.'s, Lady Ruby Eliot, Lady Aileen Eliot, Mr. Sladen, private secretary to the Governor-General, Major Maude, Lt.-Col. Sherwood and Chief of Police Powell.

The raft was built on the old accepted plan, fashioned from medium sized timber, neatly hewed. It was divided into five cribs, A large Royal standard caught the breeze from the crib whereon the Duke and Duchess made the trip. Hardy rivermen in typical costume, red flannel shirts, blue Jean overalls, flowing sashes and slouch hats, guided the raft. Mr. William Wade, one of the pioneer pilots of the Ottawa, was on board, and others included G. Garnett, A. Williamson, A. H. Hough, T. Weldon, I. Cropley, D. Frost, John Hudson, D. Wade, O. Robillard, S. Coger, W. Hudson, A. Blouffe, H. Byrnes, P. Dorresty, P. Fobear, E. Laflamme, E. Lachapelle, T. Owens, W. Cooke and many others.

Each section of the raft was preceded by an advance party of voyageurs in bonnes. On the first crib were English, American and local newspaper men, all of whom enjoyed the novelty immensely. On the second crib were the children of the vice-regal household and members of the entourage of the Royal party. On the third crib were the Duke and Duchess of Cornwall. The bridges and approaches were lined with spectators, who broke into cheers as the Royal crib hove in sight and passed through. Following the Royal crib came two others bearing Sir Wilfrid Laurier and a party of lumbermen and newspaper men. The fact that the water in the slides was very low, detracted from the zest of the trip, and the cribs several times narrowly escaped grounding.

At the foot of the slides the heir apparent and his consort and suite transferred from the cribs to canoes. The largest, 35 feet long, were the regulation Hudson Bay Company's trading canoes. Each carried nine passengers, besides a crew of eight men. The latter were Indians and half-breeds brought from Abbitibi,

LUMBERMEN'S RECEPTION AT OTTAWA—THE ROYAL PARTY DESCENDING THE CHAUDIERE SLIDES.

the height of land, by Mr. Colin Rankin, the well-known Hudson Bay Company's factor at Mattawa. Mr. W. C. Edwards, M.P., also brought a party from the Desert, in the northern Gatineau district. In the canoes the Royal visitors were taken to Rockliffe, where from a point of vantage, they witnessed an exciting war canoe race for the championship of Canada, and a log rolling contest.

At the canoe club house the Duke and Duchess were received by Hon. Peter White, the well-known Pembroke lumberman, and Mr. W. C. Edwards, M.P., another extensive operator. In the park a typical lumbermen's shanty had been erected to which the distinguished visitors were escorted. The shanty, shown on this page, was constructed of neatly trimmed round pine covered with regulation "scoops." It was one of hnndreds erected in the last half century in the Ottawa Valley lumbering districts. The scions of Royalty were received by the brawny armed red-shirted shanty men, who stood at "attention" with pike pole in hand. Pike poles, axes, saws and cant hooks lay about ready for use. They were soon brought into action on the neighboring pines which have made Rockliffe famous. Saw logs were shaped and skidded to the accompaniment of lusty shanty songs. Luncheon was partaken of in the log cabin. The Royal party and the committee men and members of the press were banqueted in typical lumber style on pork and beans. There were no frills at all, and their Royal Highnesses drank and ate out of tin cups and plates. The great fire place was situated in the centre of the room, where the smoking beans were roasting. The smoke was emitted through a hole in the roof of the shanty. Only a few at a time were admitted, and the Duke and his wife with their immediate following entered first of all. The French-Canadian cook was immensely tickled, particularly with the way in which Her Royal Highness appreciated the viands. Some of the train were a little more fastidious ; but the Duchess rallied them on their poor appetite, and put them to shame. After this primitive feast, the whole of the guests adjourned to a neighboring tent, where something more lavish was in evidence.

The succession of events from the boarding of the cribs to the shanty luncheon were true in detail and coloring. It was entertainment distinctively Canadian. It told the Royal visitors the secret of Ottawa's wealth and of Ottawa's industry. The Royal visitors were received at the lumber shanty by Mr. W. H. Fraser, Mr. A. Lumsden, M.L.A., Mr. John R. Booth and Mr. J. C. Browne. The Duke was convulsed with laugeter by a humorous and impromptu speech delivered in broken English by Wm. Whissel, one of Mr. W. C. Edwards' employees who superintended the construction of the shanty. Upon command of Mr. Edwards the lusty lumberman stood forth to address himself to the King's son. Twice he essayed to speak and then with an effort began in the French language. Loud cries of "Anglais," "Anglais," resounded in the forest. The gigantic lumberman smiled and waved his hand deprecatingly. "I cannot" he said, but at the words a cheer broke forth and he went on in the same language telling in simple words the story of the lumberman's joy to see the son of the King and his Duchess, and what simple shanty men had done that day had been done in all honour and affection for the Royal visitors. "Well" he said, "me born in shanty, and live long time ; see much money Mr. Edwards make ; think me make plenty myself likewise, too. So I start out to make much money myself. First year I make seventeen thousand dollar—debt. Then go to church on the Sunday and say to good Lord 'Oh, Lord Almighty, you know Wm. Whissell can't pay all that debt ; Oh, Lord, I give it to you.' After that me work for Mr. Edwards, and now make much money."

The Duke and Duchess were much amused. They shook hands with the honest-hearted, hard-handed woodsman. Before departing the heir apparent said : "The Duchess and I since we left England have seen many interesting things in various parts of the world, but we saw nothing that gave us more pleasure than what we have witnessed here to-day."

On Saturday, September 21st, the Royal visitors drove through Hull, where they received an enthusiastic welcome. A holiday had been proclaimed at the Eddy works, and the employees and their families numbering in all over 2,000 souls greeted them right royally. The far-reaching Eddy buildings were lavishly decorated. Mrs. E. B. Eddy presented the Duchess with a basket of roses. Work was also suspended in Mr. J. R. Booth's mill. All the lumber waggons, about 50 in number, were drawn up in line, the horses facing Bridge street. The employees from points of vantage on the waggons, buildings, cars and lumber piles waved flags and cheered enthusiastically. The Booth offices were tastefully decorated, as were the offices of the W. C. Edwards Company and other local lumber firms.

THE LUMBER SHANTY,
Where Luncheon was served to the Royal Party in typical camp style.

The following were the members of the Lumbermen's Committee, of which J. R. Booth was chairman and J. C. Browne secretary: Wm. Anderson, F. W. Avery, Samuel Bingham, R. M. Beckett, C. Jackson Booth, L. Blackburn, E. H. Bronson, F. P. Bronson, Robt. M. Cox, Levi Crannell, Hon. R. R. Dobell, H. K. Egan, Alex. Fraser, J. B. Fraser, Allan Gilmour, John Gilmour, G. B. Reid, Hiram Robinson, Peter Whelen, Walter White, Ottawa ; Gillies Bros., Braeside ; J. and A. Gillies, Claude McLachlin and Hugh McLachlin, Arnprior ; Georg Gordon, Thomas Mackie, J. W. Munro and Hon. Peter White, Pembroke ; James B. Klock, Klock's Mills ; A. Barnet, James Carswell and Allan Francis, Renfrew ; George Bryson, Fort Coulonge : Robert. Conroy, Aylmer ; E. B. Eddy, Hull ; W. C. Edwards, M.P., Rockland ; John Ferguson, Adamston ; Hon. R. R. Dobell, Lorenzo Evans, W. M. Dobell, John A. Cameron, H. W. Todd, Gordon Edwards.

THE MARITIME BOARD OF TRADE.

The seventh annual convention of the Maritime Board of Trade was held in Chatham, N.B., on August 21 and 22. Among other questions discussed was fire insurance rates. On this subject Senator J. B. Snowball, of Chatham, said : "We live in the district in which in 1825 was the greatest fire since the destruction of Sodom and Gomorrha. I refer to the great Miramichi fire, whose smoke, it is said, could be smelt 700 to 800 miles away. Instead of saying where is the remedy, I would say, where is the evil? The trouble is there are too many needy people going about the country trying to make a living out of insurance premiums. The companies pay too much in commissions. I cannot say whether any of them get 20 per cent., but I know some of these agents get as much as 15 per cent. I believe that more than half the fires in the Miramichi districts during the last fifty years have been due to carelessness. Out of the lumber mills on the Miramichi river the fire insurance companies have made a handsome profit. I do not think I am exaggerating when I say they have made 100 per cent. The old Cunard mill was in existence for 50 years, and during all that time regularly paid insurance rates. True, it was eventually burned down, but consider the amount of money that had been taken out before that took place. As I said before, there are agents who take too many hazardous risks. You should combine to expose them. That is the remedy."

Mr. M. G. DeWolfe brought up the subject of "Forest Preservation," and introduced the following resolution, which was unanimously passed :

Whereas the subject of forestry is a most important one, and there is no question but that it has been too long neglected in Canada, and,

Whereas the manufacture of lumber has been one of the most important industries in the Province of Nova Scotia and New Brunswick, and it is now anticipated that pulp mills will consume a very large quantity of standing timber, and,

Whereas, it is apparent to everyone that the depletion of the standing timber of all kinds of wood by forest fires and the axe is fast denuding our forest lands and rendering them of no value, and,

Whereas, it is believed that with the prevention of fires, protection to the rapidly-growing timber and the systematic cutting of trees for lumber, our forests will be of value for many years to come ; therefore,

Resolved, that in the opinion of this Board of Trade, the Government should take immediate steps to see that suitable overseers or inspectors be put in charge ot the timber districts of Nova Scotia and New Brunswick, as an incentive to owners of private lands to guard and protect all Government timber lands, and reforest any suitable area that may be found fit for the purpose.

The secretary introduced the subject of "More Permanent Material for Public Wharves and Breakwaters." He explained that owing to the attacks of a worm called the teredon on

the piles and other timber, on the wharves and breakwater of northern New Brunswick, and o fthe limnoria on the wharves and breakwater along the Atlantic coast, these structures had to be frequently replaced after being in use three or four years. He said that by creosoting the lumber it would be preserved against the depredations of the worms in question. At present the creosoted wood that had been used had been imported from Virginia. He advocated the establishment of a Canadian creosoting industry and submitted the following resolution :

Whereas, the natural timber which is mainly used in the construction of Government wharves and breakwaters on the waters of the Straits of Northumberland and parts of the Atlantic Coast of Nova Scotia is rendered very perishable owing to the ravages of the toredo and limnoria worms, and,

Whereas, the creosoting of such timber is the only discovered method of preserving it from the operation of those destructive agencies, and,

Whereas, there are no creosoting works nearer to the Maritime Provinces than New York and Norfolk, Virginia, therefore,

Resolved, that this Board begs respectfully to suggest to the Dominion Government the desirability of aiding in the establishment of such works at some point in the Maritime Provinces where suitable timber is convenient and may be obtained and creosoted economically.

Mr. DeWolfe seconded the motion, and Mr. W. A. Black spoke in favor of the Government assisting in the establishment of such works

THE PEARCE COMPANY.

The business of The Pearce Company, Limited, at Marmora, Ont., is a continuation and extension of that established by the late T. P. Pearce in 1867. The present company was incorporated in 1893. Mr. J. D. Pearce is president; Mr. F. S. Pearce, vice-president and general manager; and Mr. J. W. Pearce, secretary-treasurer.

The mills of the company are located at the the village of Marmora, Hastings county, where the company controls an entire water power, by which they operate their saw, shingle, lath, planing, roller, flour and woolen mills, as well as an electric light plant. The mills are equipped with modern machinery and appliances. The yards extend one-half mile along the water front, which is owned exclusively by the company. A branch of the Central Ontario Railroad runs through the yards, with siding to mill platform, thus providing first-class shipping facilities.

The Pearce Company, Marmora—Saw Mill, Flume, Woollen Mill, etc.

The company deal extensively in ash, elm and basswood, most of which is shipped to the United States. They also manufacture a considerable quantity of white cedar shingles and make a specialty of hemlock bill stuff. In addition to the above they turn out a large number of railway ties, cedar posts and telegraph posts. The capacity of the mill is 50,000 feet per day.

The company contemplate building a stave and heading factory. Their limits extend over a great part of two townships and will provide the raw material for their mills for many years to come.

NEWFOUNDLAND AS A LUMBER FIELD.

The timber possibilities of Newfoundland are now attracting much attention. A prominent Scotch lumberman, operating in Sweden for 20 years past, having exhausted his forest reservations there, has removed to that island, where he has secured 800 square miles of forest, which will enable him to supply, without any dislocation of trade, the markets of England and Scotland, where he has sold his produce for years. He proposes to cut 80,000,000 feet of lumber every year, but it is not as much in the quantity as in the novel minor phases of the industry that it may form an instructive example.

In Sweden and other European countries, where the extinction of the lumbering business is within measurable distance, the most drastic economies have to be practised in order to make lumbering pay. For instance, the saws are of the thinnest razor steel, and the heavy cut made by the thick saws used on this side of the Atlantic causes the Swedish operator to term our methods a "slaughter of wood." The fineness of the cut with them frequently enables the getting of an extra board or two out of a large log. Again, the slabs, or outside cuttings and end pieces, are put to use, being disposable for many purposes. Yet, again, the fragments left over from these are converted into kindlings and sold as such in the cities of Europe, a small but welcome addition to the profits being thus provided.

In addition to producing lumber in the form of deals and boards of usual grades, this Scotch gentleman will turn out immense stocks of spruce staves and headings to be manufactured in Scotland into barrels for the famous Scotch herrings. At all the leading fishing centres in Scotland there is a great demand for such material. To Hamburg will be shipped steamer loads of small wood to be worked up into packing boxes.

Another venture will be the providing of immense stocks of similar material for bicycle crates. The growth of the trade in this class of product has been amazing in recent years, and Sweden, the chief centre of the traffic, has latterly been unable to supply the demand.

For the staves pieces of wood from 2½ to 5 inches thick can be used, while for the boxes pieces as small as 2 by 4 by 6 inches are available. Practically everything, indeed, can be turned to use, the wastage being almost nil. Expert Swedish lumbermen and mill hands are employed, and some of the product is to be shipped even to the Canary Islands.

The colony contains large tracts of pine, besides great areas of splendid spruce, suitable for pulp alone and fir, which is as tough and hard as American and Canadian spruce, is also being used for pulp-making. This fir has been found by exhaustive tests to make almost as good pulp as spruce. The fibre is as fine and regular, and the ease of working the same. The ultilization of fir trebles the area available for pulp purposes, and makes the island destined in a few years to be one of the great pulp centres of the world. Several American con-

The Pearce Company, Marmora—Shingle Sheds, Pine and Hemlock Piling Yards and Booms.

cerns are already seeking pulp concessions in the island, and it is expected that before long they will be establishing factories here.

A further advantage the island has is its nearness to the European markets. Newfoundland is but little over half the distance that Montreal is from Europe, and its products have to be carried only half the way that those of Canada must be borne. This means a great cheapness of freight, and then all classes of workmen there are paid lower wages than in the United States and Canada. There are, likewise, no taxes imposed upon the industry, save a royalty of 50 cents per 1,000 feet on sawed lumber, and the conditions are therefore so favorable that it is not surprising the forest wealth of the island is being noted by outside capitalists as a promising means of building large and productive enterprises.

TIMBER REGULATIONS.

By order in council, dated 19th of January, 1899, the regulation governing the granting of yearly lincenses and permits to cut timber in Manitoba, the North-West Territories and the railway belt in the province of British Columbia, were amended so as to permit owners of timber berths in the railway belt to sell timber thereon to mill owners, the regulations having previously provided that the timber must be manufactured at the saw mill of the licensee to be operated in connection with the berth.

There is, therefore, no provision in the regulations as they exist at present to prevent the exportation of logs out on Dominion lands in the railway belt in the province of British Columbia. The minister, therefore, recommends that the regulations be again amended so as to provide that all timber cut on berths in the railway belt in British Columbia shall be manufactured within the limits of the Dominion.

ADVERTISING RATES FURNISHED ON APPLICATION

THE CANADA LUMBERMAN is published in the interests of the lumber trade and allied industries throughout the Dominion, being the only representative in Canada of this foremost branch of the commerce of this country. It aims at giving full and timely information on all subjects touching these interests, discussing these topics editorially and inviting free discussion by others.

Especial pains are taken to secure the latest and most trustworthy market quotations from various points throughout the world, so as to afford to the trade in Canada information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. We need not point out that for many the CANADA LUMBERMAN, with its special class of readers, is not only an exceptionally good medium for securing publicity, but is indispensable for those who would bring themselves before the notice of that class. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which will be inserted in a conspicuous position at the uniform price of 15 cents per line for each insertion. Announcements of this character will be subject to a discount of 25 per cent. if ordered for four successive issues or longer.

Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

AMERICAN COMPETITION.

Publicity is being given to what is claimed to be the opinion of a prominent lumberman to the effect that the ultimate result of the Ontario saw-log legislation will be the capture of the Canadian lumber trade by American lumbermen and the crowding out of Canadians. On what ground the opinion is based is not stated, but we presume that the alarm has been caused by the number of large mills that are moving from Michigan to Canada. Canadian lumbermen, however, are not at all concerned lest their business should be ruined by competition from the Americans.

The removal of the Michigan mills to Canada is just the result that was hoped for when the Ontario law was passed. The Government simply said: "If you wish our timber you must establish your manufacturing industries in this country and contribute to our welfare." It matters little whether the timber is manufactured by native-born Canadians or Americans now doing business in Canada, so long as the country derives benefit from its manufacture. The policy of the country is sufficiently cosmopolitan to welcome any person who is prepared to assist in the development of its natural resources. Where the Americans establish saw mills thriving settlements will no doubt grow up, as is the custom. The transfer to Canada of industries conducted by such well-known capitalists as Arthur Hill, Edmund Hall and the Eddys, is a source of gratification rather than of regret.

We think the unanimous sentiment of Canadian lumbermen is expressed in the statement that they do not fear disastrous competition from Michigan lumbermen who may locate in Canada. In business capacity our lumbermen are the equal of those of the United States, and in equipment our mills do not take a second place. Perhaps the agitation for an import duty on lumber has created a wrong impression in the mind of the public. What Canadian lumbermen ask for is not protection, but equal rights, in the taxing of lumber brought into Canada to the same extent as lumber shipped to the United States.

The effect of the increased production in Ontario will not be to demoralize the Canadian trade. It should be remembered that the output of the Michigan mills located in Ontario will not be greater than when the mills were in operation in Michigan, consequently the total output of lumber will not be increased. The consumption by the Canadian market represents but a small portion of the output, and a large percentage will continue to be marketed in the Eastern States and foreign countries. No doubt the Michigan concerns will capture a certain portion of the Western Ontario trade, but at most this is not a serious mater.

The argument that Americans are crowding out the Canadian lumbermen would seem to be well answered by referring to the sales of timber limits. During the last five years the Government has held two important sales. At the one in 1899, 360 square miles were disposed of, of which only nine miles were secured by Michigan lumbermen, and this was by a concern that had been operating in Canada for several years. At the sale held last month 362 square miles were purchased by Canadians and 37 miles by Michigan parties. At both of these sales a large representation of Michigan lumbermen was present.

WOOD SPECIALTIES.

The opportunities that exist in this country for the mannfacture of wood specialties have been taken advantage of only to a limited extent. It is strange that more money has not been invested in this branch of industry, as it offers prospects of excellent returns. Throughout Northern Ontario there is to be found an abundance of white birch specially adapted for the manufacture of articles such as tack barrels, spindles, egg cups, pill boxes and similar goods. There are districts where as much as 3,000,000 feet of white birch can be secured within a radius of five miles, and there is little difficulty in finding a suitable water-power by which means would be provided of operating the plant at the smallest possible cost. We mention birch in particular because it is well adapted for turning purposes and is not in as great demand as lumber. Large quantities of other hardwoods, however, may be obtained.

In the manufacture of these small articles there is practically no waste timber, and a small quantity of logs will furnish the raw material for a large output. We understand there is a large market in Canada for such articles. The users have in the past been compelled to import their supply, but if industries were established in Canada they could doubtless compete with the foreign article and would be given the preference. Taking the prices now ruling, there would be a satisfactory margin of profit.

Picture-backing is another branch that might profitably engage the attention of more of our manufacturers. There is a large demand on both local and export account. We are informed that the Dwight Lumber Company, of Detroit, utilize 2,500 planks per week in the manufacture of picture-backing, keeping several machines constantly working on this trade.

The manufacture of excelsior has been investigated by one or two Canadian firms, who were evidently not satisfied with the prospects. The home demand is not large, and the excelsior trade of Great Britain is so tightly in the hands of the Germans that Canadians are not likely to secure much business except they can offer very low prices, and heavy carrying charges are against this.

It is desirable that the hardwoods of Canada should be manufactured within the country to the greatest possible extent, and we believe there are opportunities for investment which should be investigated by our lumbermen.

THE USE OF NATIVE TIMBER.

With the quantity and character of timber in this country, the question might well be asked, are the imports of timber not greater than they should be? There seems to be a disposition in some quarters to import timber and disregard the claims of home industries. No particular fault can be found with the person who imports a foreign article because of inability to obtain what is required at home, but there have doubtless been instances where Canadian timber would have met the requirements equally as well as that which has been imported.

Almost unconsciously perhaps, from the force of custom, some architects specify foreign timber for buildings without giving any consideration to the question of obtaining a supply in the country in which the building is to be erected and which is providing the funds for its erection. Harbor work, such as wharves and piers, is also often built of southern wood when Canadian timber would answer. Perhaps the qualities of Canadian timber are sometimes overlooked or forgotten. It might be of advantage for our lumbermen to appoint a committee to have distributed pamphlets showing the uses to which Canadian timbers may be applied and the results of tests of strengh which have been made at the Universities and elsewhere. This same committee might be empowered to arrange for the carrying out of further tests.

An illustration of the neglect of native wood is furnished by the regents of the University of Michigan, in calling for the use of yellow pine flooring in a new hospital building at Ann Arbor, totally ignoring the fact that Michigan is the home of as fine white maple as grows.

At the present time tests of Pacific Coast fir and Texas yellow pine are being made at Bremerton, the naval station on Puget Sound, to determine the relative merits of the woods for use in the construction of naval vessels. These tests are made as the result of a complaint by the Pacific Coast Lumber Manufacturers' Association that Texas yellow pine was being used in naval vessels constructed on the coast when the native fir was better adapted for the purpose. In the transverse tests thus far made the native wood has been shown to be superior.

Pride should be taken in our home industries and support given them accordingly, even if it is necessary to strain the theory of preference to the limit.

EDITORIAL NOTES.

It may not be amiss to call attention to the merits of spruce timber as a box material. That it has not been used to a greater extent in the past is doubtless due to the lack of familiarity with the wood. For box-making purposes it is superior to white pine ; in fact, there is no better box material to be obtained. For boxes for butter, fruit, etc., it is very desirable, as it does not taint the contents. There would seem to be good reason to expect a large consumption of spruce in box-making in the near future.

When wages are high and employment plentiful there is more or less difficulty in retaining the services of employees. In no branch of industry is this felt to a greater extent than in the lumber trade. Lumbermen report that they are unable to keep their men at work in the woods; they are very unsteady and will leave upon the slightest provocation, knowing that their chances of securing employment elsewhere are good. In some districts mills have been compelled to close down their night shifts owing to the scarcity of good workmen. These conditions are likely to have the effect of materially reducing the output of lumber next season.

A representative of the CANADA LUMBERMAN, who recently visited the Georgian Bay district, found that the question of uniform grading of lumber is much talked of, and that there is a strong feeling in favor of such a system. The LUMBERMAN has always recognized the advantages to be derived from the adoption of a standard system of grading by all manufacturers, and we believe that before long steps to that end will be taken. A majority of the manufacturers already admit the necessity of some change from the present system, which permits of each manufacturer defining his own grades. What is wanted is that two or three energetic persons take the matter in hand, and we have no doubt that they would receive the support necessary to carry it to a successful issue. If some action is not taken Canadian lumbermen are likely to lose in competition with the United States, where standard inspection of both pine and hardwoods is now recognized.

At a recent convention of box-makers, held in Rochester, a gentleman made the surprising statement that the quantity of lumber imported into the United States from Canada was now only about one-eighth of what it was under free lumber. He also said that the price of lumber in Canada is now very much lower than in the United States—the result of the duty. These remarks are so far from the facts as to make contradiction almost unnecessary. Statistics show that our exports to the United States last year were almost up to the average year before the imposition of the duty, while the price of lumber in this country is quite as high as in the United States, and higher than it was before the duty. The duty was imposed in the summer of 1897. In the spring of that year two-inch picks and uppers were selling in Toronto at $34, dressing and better at $22, and mill culls at $10. To-day prices for these grades in Toronto are : Picks and uppers $38, dressing and better $24, and mill culls $13. Instead of lumber selling lower than before the United States duty was imposed, there has been a substantial advance. This, of course, is due in part to improved commercial conditions.

THE GOVERNMENT TIMBER SALE.

It was a distinguished gathering of lumbermen that waited patiently in the Legislative chamber of the Parliament Buildings on the 17th ultimo for the limits with which they hoped to enrich themselves to be placed under the hammer. Before the arrival of the auctioneer, Mr. Peter Ryan, every desk in the room was occupied. Every white pine district of the province was represented, and there was a goodly quota from the once famous pine state of Michigan. Altogether about 400 square miles were offered. The conditions governing the sale contained the now customary manufacturing clause and also provided that the pine on the Algoma and Thunder Bay berths should be taken off within ten years and that on the three forfeited berths within five years.

The sum realized for the berths sold was approximately $733,000, or an average of about $1,842 per mile. Considering the quantity and character of the timber, the result was no doubt satisfactory to the Government. The opinion was freely expressed after the sale that the prices were high although not exorbitant. They are regarded as another proof of the growing appreciation of the value of pine timber.

The bidding from the outset was quite brisk, so brisk indeed that the auctioneer could not have felt the necessity of calling upon his abundant fund of humour in order to encourage bidding, as is his wont. The large plums were secured by Messrs. Dyment, Beck, Spohn, Barnet and Munro. The familiar voice of Mr. John Waldie was occasionally heard, but it was not his lot to secure any of the coveted property. He showed, however, that he still had abundant faith in pine limits.

It was a source of satisfaction that a limit of 13½ square miles was knocked down to Mr. J. E. Murphy. Mr. Murphy has been known in the past as a hardwood lumberman, but as his timber supply has become pretty well exhausted, he is evidently turning his attention to pine.

Considering the number of American lumbermen present, it was expected that they would secure a goodly portion of the limits. Their presence was surely not the result solely of curiosity. The limits sold were all in the Georgian Bay district and in the vicinity where the Michigan lumbermen are operating.

Those present at the sale included the following : J. B. Fraser, H. K. Egan, Lieut.-Col. W. G. Hurdman, R. J. Blackburn, Ottawa ; W. A. Charlton, M.P.P., John Waldie, J. B. Miller, W. P. Bull, Joseph Oliver, R. Laidlaw, H. M. Weller, Hugh Munro, George Cook, W. B. McLean, John Gray, H. Hancock, W. Ryan, Thomas Southworth, Toronto ; Thomas Mackie, M.P., J. W. Munro, M.P.P., J. R. Munro, Robert Booth, P. Shannon, A. B. Gordon, B. C. Bahnsen, Pembroke ; H. S. Brennan, Hamilton ; Hon. John Charlton, Lynedoch ; James Playfair, D. L. Whte, jr., Midland ; R. McConnell, Mattawa ; G. R. Dupuy, A. Trotter, Wallaceburg ; H. C. Hamilton, John Collins, Sault Ste. Marie ; P. McDermott, South River ; A. Barnet, J. A. McFadden, Renfrew ; W. J. Sheppard, Waubaushene ; N. Dyment, Barrie ; C. Beck, Dr. Spohn, Penetanguishene ; J. E. Murphy, Hepworth Station ; Peter McArthur, Quebec ; J. Whitesides, Huntsville ; R. Vigars, Port Arthur ; A. E. Dyment, Thessalon ; George McCormick, M. P.F., Orillia ; C. A. McCool, M.P., Geneva Lake ; Selwin Eddy, J. O. Fisher, A. E. Eddy, J. Boyle, Bay City, Mich. ; Maurice Quinn, Matthew Slush, Arthur Hull, Saginaw, Mich. ; E. W. Sparrow, Lansing, Mich. ; James M. Rankin, St. Clair, Mich. ; A. McIntosh, Cheboygan, Mich.; J. W. L. Galloway, Hillsdale, Mich. ; J. Mullin, Duluth, Minn. ; J. S. Gage, Vineland, N.J. ; J. C. Spry, C. O. Hotchkiss, Chicago, Ill. ; F. J. Arpen, D. Scott, Grand Rapids, Wis.

DUMPING SAW-DUST IN RIVERS.

In June, 1897, an act was passed by the Dominion Parliament forbidding the dumping of saw-dust into the Ottawa river, the Ottawa lumbermen having previously been exempt from the working of the Fisheries' Act in this respect by special legislation. In order that the lumbermen could make other arrangements for consuming the saw-dust, the time for the enforcement of the act was, upon representation to that effect, extended to January 1st, 1898, and subsequently one year later. It seems that since that time the law has been ignored by some parties, who have continued to dump saw-dust into the river. The first prosecution took place on September 10th, when Mr. J. R. Booth, the millionaire lumberman, of Ottawa, was fined $20 and costs. Afterwards Mr. Booth stated that it had been his intention to build a burner to consume the the saw-dust, although this could not be done within perhaps six months. He continued to discharge the saw-dust of his mill into the river. A second prosecution was the result, the fine in this case also being $20 and costs. It is reported to be the intention of the authorities to continue to prosecute Mr. Booth until the act is complied with, while Mr. Booth is said to be considering the removal of his mill to another point. The outcome will be watched with some interest, as the removal of the mill will be a great loss to Ottawa and Hull.

The state of Michigan has just appointed half a dozen officials and scientists to report as to the best method of reforesting a tract of 57,000 acres in the great pine belt, which had been burned over.

Attention is directed to the advertisement of the Dominion Leather Company, 528-530 Front street west, Toronto, which appears on front cover page of this issue. This company manufacture " Hepburn's" pneumatic belt, made of specially prepared canvas, gutta percha and balata, they being sole representatives for the Dominion of Canada. This firm make a specialty of lumbermen's leather mitts in all sizes.

THE CHEMICAL PRODUCTS OF WOOD.

Frank H. Mason, consul general at Berlin, Germany, has in response to a request from a resident of Michigan, transmitted through the state department, furnished an interesting and valuable paper upon the production of wood charcoal and recovery of the by-products, from which the American Lumberman has condensed such portions as are of most practical interest to lumbermen.

Coincident with the development of coke manufacture in Germany by the use of retort ovens, which recover the ammonia, gas, tar and its valuable derivaties that are wasted by the primitive "beehive" oven process, has been the improvement in methods and apparatus for wood distillation, through which the production of charcoal has been raised through the archaic, wasteful, earth-kiln process that recovered only charcoal and tar, to an intelligent, scientific system by which every valuable element in the wood is saved and added to the wealth producing power of the forests. So far has this been carried that special patented processes have been devised for using even sawdust and the rough outer bark of trees as material for the manufacture of charcoal and other products.

The apparatus for wood distillation, which will be briefly described in a later section of this report, includes cast and plate iron retorts of various types, as well as ovens of masonry, together with pipes, coils, tanks and pans for condensation and rectification of the several distillates and ultilization of the gases. Retorts are either heated by direct firing from beneath or by superheated steam introduced in coils. Retorts with direct heating by fuel or gas flame are most in use, and they are of two general classes—the horizontal and the vertical.

1—THE PRODUCTS OF WOOD DISTILLATION.

These form four primary groups, which, with their derivaties, may be synopsized as follows :

(1) Uncondensed gases, which may be burnt as fuel, or, after certain treatment, used for illuminating purposes.

(2) Tar, from which are derived benzol, naphthalene, paraffin, rosin and phenyl acid (creosote).

(3) Pyroligenous acid (wood vinegar), from which are derived acetic acid, acetone and methyl, or wood alcohol.

(4) Charcoal.

The quantities of these several products which can be obtained from the distillation of a certain quantity of wood vary considerably according to the species or kind of timber used, its dryness, and especially the time consumed by the process of distillation, it being a general principle that, within reasonable limits, slow distillation yields larger percentages of distillates than are recovered when the process is quickened. All this has been reduced to exactly demonstrated results by the German chemists, and these have been tabulated by Professor Fisher, in his "Chemical Technology," to show the comparative yield, by slow, and by quick distillation respectively, of the seven species of wood that are most employed for charcoal manufacture in Germany. The table shows for each kind of wood two lines of figures, the first of which (slow distillation) shows the products obtained when the wood was put into a cold retort and heated for a period of six hours ; the second line (fast distillation) shows the results when similar wood was put into a glowing retort and exposed to a fierce heat for a period of three hours :

Wood, 100 Parts.	Total Distillates.	Tar	Hydrated Wood Vinegar (raw)...	Pure Acetic Acid.	Charcoal (dry)....	Uncondensed Gases ..
Hornbeam (Carpinus betulus)—						
Slow distillation	52.40	4.75	47.68	6.43	25.37	22.23
Fast distillation	48.52	5.55	42.97	5.23	20.47	31.01
Birch (Betula alba)—						
Slow distillation	51.05	5.46	45.59	5.63	29.64	19.71
Fast distillation	42.98	3.24	39.74	4.43	21.46	35.56
Beech (Fagus Silvatica)—						
Slow distillation	51.65	5.85	45.80	5.21	26-69	21.66
Fast distillation	44.35	4.90	39.45	3.86	21.90	33.75
Poplar (Populus tremulas)—						
Slow distillation	47.44	6.90	40.54	5.10	25.47	27.09
Fast distillation	46.36	6.91	39.45	4.36	21.33	32.31
Oak (Quercus robur)—						
Slow distillation	48.15	3.70	44.45	4.08	34.68	17.17
Fast distillation	45.24	3.20	42.04	3.44	27.73	27.03
Larch (Larix decidua)—						
Slow distillation	51.61	9.30	42.31	2.69	26.74	21.65
Fast distillation	43.77	5.58	38.19	2.06	24.06	32.17
Spruce (Pieea excelsa)—						
Slow distillation	46.92	6.93	40.99	2.30	34.30	18.78
Fast distillation	46.35	6.20	40.15	1.78	24.24	29.41

These figures show the yield in pure, hard charcoal, which, on exposure to the air, absorbs moisture to an extent of from 4 to 10 per cent. of its weight, according to the kind of wood from which the charcoal was made. Of the above varieties, the English hornbeam is practically similar to the "blue beech" (Carpinus Americana) of the United States ; and the beech, birch and spruce are nearly so identical with American woods of the same name that the foregoing table of distillates will be found substantially correct for the woods mostly employed for charcoal manufacture in our country. It will be seen that the charcoal yield is about one-fourth of the entire weight of wood, the total distillates one-half, and the greater portions of these is hydrated wood vinegar, which in its crude form contains about 12 per cent. of crystalized acetic acid.

2—NATURES AND USES OF THE SEVERAL DISTILLATES.

This section of the report abounds with chemical technicalities and terms, and only a portion of it is reproduced.

Taking up these several by-products in their order, the second in commercial importance is probably the wood tar, which is found more or less in all kinds of timber, but most plentifully in the larches and other conifers.

A—THE TAR PRODUCTS.

Wood tar is composed mainly of several hydrocarburets, some of which have only a scientific interest. The tar which contains them is expelled from the wood at a temperature exceeding 360° Celsius. The higher the temperature and the more rapid the process of distillation, the greater the percentage of tar and gas produced and the smaller the yield of acetic acid. The tar obtained as a by-product of charcoal manufacture from hardwoods is mainly used for the production of creosote and applied to the antiseptic treatment of wood, such as posts, railway ties, paving blocks, etc., to protect the fiber against decay. When used as a raw material for producing any of the hydrocarburets, that forms a separate chemical industry. The best known of them are :

Benzol ; boils at 82° Celsius ; specific gravity, 0.85.

Tulol ; boils at 111° Celsius ; specific gravity, 0.87.

Xymol ; boils at 139° Celsius ; specific gravity, 0.875.

Cumol ; boils at 166° Celsius ; specific gravity, 0.887.

Cymol ; boils at 175° Celsius ; specific gravity, 0·85.

By reason of these sharply defined characteristics they can be rather easily separated, and when treated with ammonia produce bases which, being oxidized, yield aniline colors. Industrially, however, anilines are mainly produced from the cheaper benzol and other derivatives from coal tar. The principal value of these elements when derived from wood tar is that they serve for a vast range of interesting researches for new and valuable shades of colors. Naphthalene and paraffin are hydrocarbons occurring in small proportions in wood tar. The paraffin is characterized by a remarkably high melting point—360° to 400° Celsius—but is of small industrial importance for the reason that it can be obtained so much more abundantly and cheaply from coal tar. Of the oxidized, and therefore acid, combinations in coal tar two have been isolated and have some scientific interest, containing carbolic acid ; but are usually left in the liquid creosote and add to its antiseptic properties for the treatment of wood.

B—THE ACID PRODUCTS.

By far the most important by-product of wood distillation in charcoal manufacture is the pyroligenous acid, or wood vinegar, which in its raw state, as it comes from the still, is an impure hydrated solution, a colorless, inflammable liquid, with a sour, pungent smell and, as already stated, 12 per cent. of pure acetic acid. It boils at 117.3° Celsius and at 4° the acid solidifies in laminated crystals which fuse at 16° C. From the table previously given it will be seen that the yield of pure acetic acid is highest in the hardwoods. Pure acetic acid is derived from raw wood vinegar by several processes, the simplest of which is as follows :

The raw distillate is first left standing for a certain time to permit the tarry elements which it contains to separate by settling. The clarified liquid is then put into a retort, with rectifying apparatus attached, and heated until the methyl alcohol and other light and volatile elements are expelled and pass over into a distillate, which is reduced by subsequent processes to alcohol and acetone, as will be elsewhere described in this report. The heating is continued until the areometer shows a specific gravity of 1,000 (same as water), indicating that the lighter elements have been eliminated. The acid solution is then drawn off and neutralized with a base—usually lime or soda. This takes up the acid, forming an acetate, which on being decomposed yields acetic acid. The cheapest base for this process is limestone, but it should be pure, or as nearly as possible freed from organic impuri-

es, which would, until eliminated, injure the uality of the acetate.

Acetic acid is sufficiently powerful to expel he carbonic acid in limestone, but the neutral- ation process causes thereby a strong effer- escence, so that it must be accomplished in rge, deep tanks in which the effervescing ixture will not boil over. If instead of lime- one burnt lime is used, the effervescence is reatly reduced; but in either case it is import- nt that the amount of basic material (lime) e not in excess. In other words, it should be st sufficient to neutralize the acetic acid— hich it does first—and not enough to take up fterward the acid elements of the tar, which, eing lighter than the acetate of lime, rise to he surface during the reaction and should be emoved by skimming. The clarified solution s then evaporated in large shallow pans, yield- ng as a residuum crude acetate of lime. Over- eating during the evaporation decomposes he acetate, so that a slow, steady and uniform eat is necessary, and for this purpose the off ases from the retorts in which the wood is listilled are used whenever practicable. The rude residuum is a gray, odorless mass, con- aining about 75 per cent. of pure calcium cetate, and forms a standard article of com- merce. It is purified by dissolving in water, iltering through bone black, and concentrates by evaporation to a specific gravity of 1.16, when the sale crystallizes in small, odorless needles, which are principally used as material or the production of acetone.

Acetate of lime appears in commerce in three grades of purity, the highest of which is now worth in large quantities 2.50 marks a kilogram (27 cents a pound) ; the medium, 1.66 marks (18 cents a pound), and the lowest grade 1.38 marks (15 cents a pound). Its growing importance as a commercial product will be inferred from the fact that the exports of acetate of lime from Germany in 1898 were 8,529,300 kilograms ; in 1899, 1,005,700 kilo- grams, and in 1900, 15,378,600 kilograms (33,295,000 pounds), of which last 1,382,140 pounds went to the United States.

When soda is used as the neutralizing base the product is acetate of soda, and the process throughout is in general similar to that when lime is employed. The acetate of soda has various uses, but its crystals disintegrate when exposed to the air, and for this and other reasons it is less important in Germany than acetate of lime. Both are, however, used as a means of extracting acetic acid from the raw wood vinegar, after which they are decomposed by various processes to obtain the crystallized acetic acid. When pure acid is to be obtained on a large scale the soda acetate is preferred, as the acetic acid obtained from calcium acetate contains impurities which are difficult to eradicate. In either case, however, the acetate is decomposed by the action of a mineral acid sufficiently powerful to displace the acetic acid from combination with the base, by which process the former is isolated. Pure acetic acid is used for many purposes, amongst others making edible vinegar. When prepared for this purpose it must be carefully cleansed from empyreumatic impurites, which give it a disagreeable, smoky flavor. It is then made into table vinegar by dissolving in twenty times its volume of water.

C—DIRECT DERIVATIVES FROM THE ACETIC ACID.

The most important is acetone, a colorless liquid which is used as a solvent in aniline and several other branches of chemical manufacture, especially in the production of smokeless powder and other explosives. Acetone is obtained by separating acetic acid into three elements—acetone, carbonic acid and water. For this purpose the acetic acid is neutralized with lime, and the acetate thus formed is heated in a retort with a stam leading to a coal condenser. On account of the low boiling point of acetone (560°), this coil must be kept at a very low temperature in order to produce complete condensation. In the industrial process the acetate of lime is dried, finely pulverized and then put into the retort, where it is heated until the acetone has passed over, when the residuum is withdrawn and again used for making fresh acetate of lime, with which the operation is repeated. Acetone of 56° to 58° purity is now worth about 50 cents a kilogram (22.6 cents a pound), and, like acetate of lime, is a standard commercial product.

The next valualbe derivative for acetic acid is wood alcohol or methyl alcohol, called in German "Holzgeist," a colorless, volatile and inflammable liquid, which boils at 66.3° C. and has a specific gravity of 0.800. It burns with a bluish flame of low illuminating power, dissolves resins, gums and essential oils and is extensively used in the manufacture of lacs and varnishes and for the denaturalization of spirits which are to be used for industrial purposes (in order to render them unfit for imbibation). The exports of wood alcohol from Germany in 1899 amounted to 6,703,620 pounds, valued at $652,354.

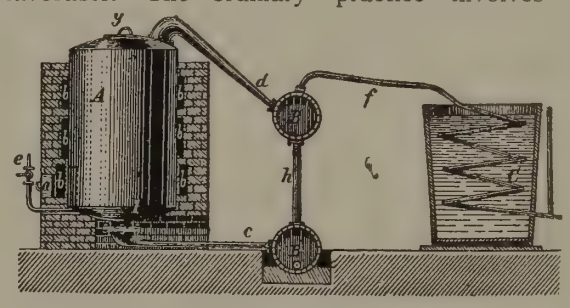
Among the other useful products of wood distillation is oxalic acid, an important substance used in dyeing and cloth printing, which was formerly prepared by oxidizing sugar, but is now much more cheaply obtained from sawdust by the action of alkalies.

III.—APPARATUS FOR WOOD DISTILLATION.

Since the commencement of wood distillation as a practical industry nearly fifty years ago many changes and improvements have been made in the machinery employed, which for economical practice requires to be adapted to the kinds of wood to be worked, the quantity to be treated at each operation, and according to which of the distillates, tar or acid, is regarded of first importance. Wood is a bad conductor of heat, so that, in the construction of all retorts, the problem is to secure as prompt and as thorough a distribution of heat as possible throughout the mass, combined with such dimensions as will render the charging of the retort with wood and the withdrawing of the charcoal reasonably convenient. All plants for wood distillation combine substantially the features which are shown in the following model, which is a simple, upright retort, with a capacity of 8 cubic meters (about 2½ cords) of wood.

In this figure, the retort A is made of ordinary or of galvanized boiler plate, set in brick masonry, with a piral flue b, so that the fire introduced at the furnace a is drawn by the chimney draft round and round the outer shell of the retort, which is filled with wood, and the charcoal discharged through the manhole y. To quicken the heating of the charge to 100° C.—at which temperature the development of gases begins—superheated steam is turned in through the pipe e. The crude inflammable gases which are first generated are discharged downward into the fire through a pipe not shown in the drawing. As the heat increases the steam and gas pipes are closed and the distillates begin to pass over. The tar flows downward through the pipe c, the acid gases pass upward through the beak d into the drum B, where the tarry vapors condense and are carried downward to the tar tank (lower B), which is kept cool by partial immersion in water. The pyroligenous acid gas, nearly freed from tarry impurities, passes on through f and the cold coil C, where it is condensed and pours out in the form of raw wood vinegar. These are the rudiments of the process.

In anticipation that the European process of making charcoal with recovery of the tar and acid products might have a practical interest for charcoal manufacturers in the United States, an engineer familiar with this industry has been consulted, and he has obtained from several German manufacturers of apparatus and fixtures for these purposes, estimates of the cost of equipment for a plant of the standard capacity, viz., 75 cubic meters (2,649 cubic feet) of wood daily. In practice it has been found most economical to set up the distillation plant as near as possible to where the wood is cut ; in other words, at the point where all conditions of transportation for raw material and products are most favorable. The ordinary practice involves



Apparatus for Wood Distillation.

the distillation of hardwoods—beech or oak—and the recovery of charcoal, tar, raw wood vinegar and methyl alcohol. The charcoal, or first product, is ready for market upon being withdrawn from the retort. The tar is sent as raw material to chemical factories, where it is worked up as a separate industry. The methyl alcohol is also a commercial product and is usually sold in its crude state ; but the wood vinegar is usually consumed on the spot for the production of acetate of lime, which, as already explained, is a convenient vehicle for recovering and transporting the pure acetic acid contained in the wood vinegar, which for this purpose is treated with ordinary limestone. Assuming, therefore, that a firm or company in the United States should wish to establish a modern German plant of this kind, and for that purpose to obtain the necessary machinery in this country, the calculation would be somewhat as follows :

Distilling apparatus complete, without buildings, for treating 75 cubic meters of wood daily, would cost here 105,000 marks ($24,990). If the capacity were increased to 100 cubic meters the cost of plant would be about 130,000 marks ($30,940). If greater capacity is desired it would be advisable to duplicate the same apparatus instead of further increasing the size of the unit.

If beech wood is used, the raw vinegar obtained will be from 40 to 45 per cent. of the weight of the wood, and the vinegar should yield 9 to 12 per cent. of acetic acid. Assuming that this is to be recovered on the spot, a plant for the daily production of 1,200 kilograms (2,640 pounds) of acetate of lime would cost, exclusive of buildings, about 15,000 marks ($3,570). This assumes that the raw pyroligenous acid is to be treated with ordinary limestone, a process which involves no technical difficulties. So far as can be ascertained, the apparatus for the industry involves few or no essential features which are covered by patents, so that a modern scientific plant, once established and its success demonstrated, could be duplicated to any extent which supply of material and the market for its products might require.

CONVENTION OE BOX-MAKERS.

The fourth semi-annual meeting of the National Association of Box and Box Shook Manufacturers of the United States opened in Rochester on August 21st. The attendance was large and the proceedings interesting. The report of the committee on Shooks for Import created a lively discussion. It stated that some progress had been made, and the basis of paying duty increased from $7 to $11 per thousand. The appraisers met with some difficulty in securing a basis, owing to the fact that some Canadian manufacturers were manufacturing stock very cheap and making a basis from a waste standpoint as to lumber manufactured, rather than box material at the basis at which stocks should be sold. Mr. James Innes said that no doubt the party in question was working deals, and had more or less waste in cutting them off, which made their material for manufacturing shooks on a cheaper basis than some other parts of Canada or the United States. Mr. Miller said that although labor was cheaper in Canada, 90 per cent. of the manufacturers in that country were in sympathy with the box-makers of the United States. It was decided that the Export and Import Committees should be continued for another six months and a report presented at next meeting. To the question, "Are you in favor of the $2 tariff?" a member replied in the affirmative, adding: "Only one-eighth of the lumber has been coming in since this tariff was placed on it. The prices since have been going down in Canada, while the eastern lumber has been going up."

Discussing the subject of "Reciprocity," Mr. Chaffee, of New England, said he would like to know how Canadians who make prices at much less than $17 could do it; provided their lumber cost $11, waste and work bill $6.40, how could they sell stuff for $14?

Mr. W. D. Sturm read a brief paper on "Piling Lumber for the Box Trade," and was followed by Mr. B. S. Atwood with a paper on "What has the Association done for the Box Trade." Mr. Cristadore introduced the subject of "Low Prices of the Past Six Months." Some of the reasons for the low prices, he said, were that No. 3 pine boards at $15 and $16 had been substituted by hemlock, and slabs, too, have had their sway in substituting for a better grade of stock. To-day we have a No. 5 board, which was substituted for No. 4 and No. 3 stock. Of course, the rapid advance for two or three years made the box user think a little, and he was not so particular about the one piece ends and whole sides as in days when he could buy almost a clear box for the same price he would pay for a poor one. Then, we find that cotton-wood has taken considerable of the white and yellow pine trade. One of the greatest barriers to reasonable prices, he thought, was the scalper.
